Sketch Showing the

MASAI RESERVE BOUNDARY

from

Farm Nº 548 to the ANGLO-GERMAN BORDER

Scale: [illegible]

Approved Boundary

698*
131

Thence south-easterly along the Anglo-German Boundary to its intersection with the Kikaleiwa River (on the slopes of Kilimanjaro);

Thence down the Kikaleiwa River to its junction with the Tsavo River;

Thence in a straight line northerly to the most southerly peak of the Chyulu (Kyulu) Range;

Thence along the summits of the Chyulu Range to its most northerly peak;

Thence in a straight line north-westerly to the summit of Emali Hill;

Thence in a straight line to the nearest point of the southerly mile-zone of the Uganda Railway;

Thence by this mile-zone north-westerly to its intersection by portion No. 1,219;

Thence by the southerly boundary of this portion north-westerly to its south-west corner;

Thence by its westerly boundary to the Kitangela River;

Thence by the Kitangela River down stream to its intersection by portion No. 337 (Athi Township) Reserve;

Thence by the westerly boundary of this portion to its intersection by the Athi River;

Thence up this river to the easterly corner of farm No. 1,124;

Thence by the southerly and westerly boundaries of farms Nos. 1,124, 192, 193, 196 and 197 to the westerly corner of the latter;

Thence in a straight line south-westerly to a beacon near the forest edge;

Thence along a beaconed line in the direction of Ol Doinyo Onyokie to a beacon overlooking the Kedong Valley;

Thence in a straight line to the south-easterly corner of farm No. 369;

Thence in a straight line to the southern corner of farm No. 369;

Thence in a straight line to the summit of Ol Doinyo Onyokie, the point of commencement.

There shall be excluded from the above area all land extending for a distance of a quarter of a mile on either side of the Magadi Railway Line, also Lake Magadi, and all land within a quarter of a mile of the said lake.

The boundary thus defined has not yet been altered by publication in the "Official Gazette," but amendments have been made in certain parts and a revised schedule has been drawn up giving what is proposed and what is in fact taken to be the boundary of the reserve.

From the Mbagathi River to Kisii Reserve.

In April, 1912, it was made apparent that the boundary demarcated by Mr. Hobley near the upper waters of the Mbagathi had the effect of cutting off the Masai from access to the water supply in that stream. This disability was accentuated by the erection of a fence by the Kikuyu under the direction of the Assistant District Commissioner at Dagoretti round the source of the stream on the supposition that it was "Kikuyu water," which fence was responsible for the creation of ill-feeling between the Masai and the Kikuyu. In deference to representations from the Provincial Commissioner, Naivasha, the Provincial Commissioner, Nairobi, agreed to move the fence back to the forest, but it appears that this was not done at the time, and the District Commissioner, Ngong, who examined the area in February, 1913, found the fence in its original position with a gap of one hundred yards, enabling the Masai cattle to pass through. Mr. Hamilton pointed out that the treaties of 1904 and 1911 had made provision for the inclusion in the Masai Reserve of the land between the Mbagathi and the Kiserian Rivers, while the Provincial boundary gazetted on the 1st of January, 1911, had given a different boundary in this part, which boundary had again been demarcated in the description of July 23rd, 1912. But these latter descriptions had made reference to the beacon erected by Mr. Hobley near the forest edge and the inclusion of this beacon as a point on the boundary excluded from the reserve in one case the greater part and in the other case the whole of the Mbagathi Stream.

Historical data of the localities occupied by the Masai showed that an equitable continuation of the boundary from the source of the Mbagathi was in a direction approximately due west, while the fence that had been erected in fact ran due south. In order to come to a final settlement of the matter, officers representing both sides were instructed to make investigation on the spot. As a result of this inspection the Governor decided that the boundary as fenced must be altered to conform with that described in the treaties.

From Mount Suswa to Mr. Powys Cobb's land.

Certain amendments to the boundary between Mount Suswa and Mr. Powys Cobb's land were necessitated in order to bring the Masai Reserve boundary up to the line of the surveyed farms.

Mr. Powys Cobb's land.

No definition has as yet been finally arrived at of the boundary of the Masai Reserve with Mr. Powys Cobb's land as far as the south-eastern corner of farm No. 548.

The Trans-Mara Area.

In February, 1913, Mr. Hemsted, accompanied by the District Commissioner, Kisii, examined the trans-Mara area with a view to the more accurate delimitation between the Masai Reserve boundary and the South Kavirondo district. The boundary suggested by these two officers was acceptable to the Provincial Commissioners concerned and was approved by Sir Henry Belfield on the completion of his tour in the reserve. It was, however, decided to postpone the gazetting of this boundary until after the conclusion of the "Masai Case."

The South-Eastern Boundary.

In August, 1914, the District Commissioner, Ngong, suggested the addition to the Masai Reserve of the country between the Kikalelwa and Rombo rivers, formerly included in the Taveta sub-district of the Seyidie Province. This would provide compensation for the area alienated from the reserve by the Magadi Railway zone and the Soda Company's settlement at Kajiado. It would also cause the Masai Reserve and the Southern Game Reserve boundaries to be conterminious on the south-east; the suggested boundary was already demarcated by beacons, and was much more definite and visible than the Kikalelwa River. This additional area provided for the needs of the Laitokitok Masai who had, in fact, used it for grazing their herds for some time. This proposed extension was recommended also by the Provincial Commissioner, Seyidie.

The most recent description.

The most recent description of the Masai Reserve boundary was written in March, 1915. This has been approved, but has not yet been gazetted, owing to the difficulty of obtaining the services of a surveyor to demarcate it. The description reads as follows:—

"Commencing at the summit of Ol Doinyo O'Nyukye, thence in a straight line in a northerly direction to a beacon on the Kijabe cart road, thence in a straight line to the most easterly corner of farm No. 2662, thence following its southerly boundary to the south-western boundary of farm No. 1380, thence along the generally western boundaries of farms Nos. 1380, 1381, 409, 410, 411 (water reserve), 413 and 1382, to the north-western corner of the latter, thence in a north-west direction to the southern corner of farm No. 1771, thence by the western boundaries of farms Nos. 1771, 1770 and 1769 to the north-west corner of the latter, thence *by a boundary to be defined hereafter*, to the north-eastern corner of farm No. 548, thence following the eastern boundary of that farm to its most southerly corner, thence in a straight line westerly to the north-eastern corner of the Sotik Native Reserve, thence along the general eastern boundary of the Sotik Native Reserve to the junction of the Amala (Engare Ol Kunono) and Nyangoris rivers, thence in a straight line to the summit of Gelegele Hill, thence in a straight line in a west south-western direction for about 31 miles to a point marked by a beacon on the Engare Rongai river, about five miles south of Rabour Hill, thence in a southerly direction to the Mogor (Gori) River, thence up that river for about 13 miles to a beacon on the south bank, thence in a southerly direction to beacon No. 17 on the Anglo-German border, thence in a south-easterly direction along the border to beacon No. 56, thence in an easterly direction along a line of beacons to the source of the Rombo (Useri) River, thence down this river to the Game Reserve beacon, where the Ngulia and Chyulu Hills (Il Doinyo Loo'l

648*
13.1

Munyenye) approach the river, thence in a northerly direction along the summits of the Chyulu Range, thence in a straight line to the nearest point of the southerly mile zone of the Uganda Railway, thence by this mile-zone north-westerly to its intersection by portion No. 1219, thence by the southerly boundary of this portion north-westerly to its south-west corner, thence by its westerly boundary to the Kitangela River, thence by the Kitangela River down stream to its intersection by portion No. 337 (Athi Township Reserve), thence by the westerly boundary of this portion to its intersection by the Athi River, thence up this river to the easterly corner of farm No. 1124, thence by the southerly and westerly boundaries of farms Nos. 1124, 193, 192, 196 and 197, to the westerly corner of the latter, thence along the western boundary of farm No. 197 northerly to its intersection by the main stream of the Mbagathi River, thence up stream to its source, thence in a straight line to the south-east corner of farm No. 369, thence following its boundary southerly to the southern corner, thence in a straight line to the summit of Ol Doinyo O'Nyukye, the point of commencement."

Mau Narok.

In 1917 two areas of 30,000 acres and 5,000 acres respectively were surveyed for Mr. Powys Cobb on the Mau Narok, and the Officer in Charge suggested the following boundary, in consultation with the Land Officer, as completing the definition of the Masai Reserve boundary in this part:—

From the north-west corner of farm No. 1769 in a westerly direction to Mr. Powys Cobb's 30,000 acre farm, thence by the eastern, southern and western boundaries of that farm to the Beacon Drwg, thence in a northerly direction to the south-east corner of Lord Delamere's Mau farm, thence following the southern boundaries of that farm to the north-east corner of Mr. Powys Cobb's 5,000 acre farm, thence following the eastern and southern boundaries of that farm to the south-west corner, thence in a straight line to the north-east corner of farm No. 548.

CHAPTER V.

A DESCRIPTION OF THE MASAI RESERVE.

Historical divisions—Administrative divisions—Geographical divisions—General description of the Reserve—Mountains—Rivers—Lakes—The Rift Valley—Eastern portion—The central portion—The western portion.

Historical divisions.

The present Masai Reserve, of which the boundaries have been defined in the preceding chapter, may be divided historically into four sections. The original Southern Masai Reserve has been in Masai occupation from before the time of European administration: the Extended Southern Masai Reserve, that is, roughly the country between the Uaso Nyiro and the Mara River formed the basis of the Agreement of 1911: the trans-Mara or Ol-Orokuti area was added subsequent to the Agreement, not being included within the terms of that treaty, and the eastern portion of the reserve, from the Ngong Hills to Kilimanjoro was added to the Masai territory by Sir Percy Girouard in signing the Agreement of 1911.

Administrative divisions.

For administrative purposes, the reserve is divided into three districts, the boundaries of which, together with the reasons for this partition, are described in Chapter V., Section I.

Geographical divisions.

For a geographical description of the reserve, three divisions may be taken, the Mara River and the Uaso Nyiro being the dividing lines between these sections.

General description of the Reserve.

The Masai Reserve extends approximately from 340° 37′ east longitude to 38° 15′ east longitude, and from 0° 34′ south latitude to 3° 10′ south latitude. It is 288 miles long and 94 miles broad, and contains an area of some 14,600 square miles, or over nine million acres.

The Anglo-German border which, throughout 236 miles of its length forms the southern boundary of the Masai Reserve in British East Africa, divides the localities inhabited by the Masai tribe into two portions of which the larger is in British territory, and does not itself conform to any tribal or social division of the Masai tribe.

Mountains.

The highest point of the reserve is to be found at its northern extremity where the boundary crosses the Mau Range. In that part of the reserve adjoining Mr. Powys Cobb's land, an altitude of 10,000 feet is reached. Little of the rest of the reserve is more than 8,000 feet in height, the most considerable mountains or groups being in the eastern portion, Ol Doinyo Orok, 8,374 feet, an isolated mass, forty miles in circumference, which rises more than 4,000 feet above the surrounding plain, and is situated on the southern borders of the reserve; the Ngong Hills, sixteen miles south-west of Nairobi, which attain an altitude of 8,074 feet: and Ol Doinyo Nyukye, 7,731 feet, a conspicuous extinct volcano, situated to the west of the Kedong Valley: in the central portion, the upper slopes of the Mau Range: the group of rugged mountains, known as the Loita Hills, whose highest point is at an altitude of 8,950 feet: and the mountainous region along which passes the Anglo-German boundary: and in the trans-Mara area, the Isuria Escarpment, and Mount Gelegele, on the borders of the Kisii country. In the south-east of the reserve, the boundary crosses the foothills of Kilimanjaro, but does not ascend that mountain to a height greater than 7,000 feet above sea level.

Rivers.

The only two considerable rivers in the reserve are the Uaso Nyiro, with its tributaries, and the Mara River. The Uaso Nyiro divides the reserve into two parts, running in a southerly direction in the neighbourhood of the 36th degree of east longitude. This river, rising in the Mau Range, and flowing into Lake Natron falls some 8,000 feet in 140 miles, and is fed in the first part of its course

648*

In his reply, dated the 3rd of December, 1913, the Secretary of State observed that in his opinion the time had not yet arrived when it was either necessary or desirable to impose a cattle tax on the Masai which might be thought by them to be the object or a consequence of the Masai move. The Secretary of State, 3rd December, 1913.

In a despatch to the Secretary of State, dated the 9th of March, 1914, the Governor remarked that a review of the present system of native taxation would no doubt be necessary in the near future, but he considered that this was not a matter of urgency and might preferably be held over until the reorganization of native administration had been effected. The Secretary of State agreed that the question might well be deferred. Sir Henry Belfield, 9th March, 1914.

On the 29th of July, 1914, Sir Henry Belfield wrote that he considered the time had come when a tax should be imposed on the cattle belonging to the pastoral tribes on the ground that the precautions taken by Government to prevent the spread of disease had enabled them to largely increase the number of their herds. He desired that the incidence of taxation should be such as to encourage agricultural industry and discourage pastoral proclivities. He therefore appointed a Committee, consisting of Messrs. Ainsworth (Chairman), McClellan, R. W. Hemsted and Northcote, to consider the subject. Owing, however, to the outbreak of war, the sittings of this Committee were delayed and were in fact never held. Sir Henry Belfield, 29th July, 1914.

Mr. Ainsworth considered the question in December, 1914, and the first three months of 1915, and submitted a report on the general question of native taxation on the 29th of April, 1915. In that part of his report which dealt with the Masai Reserve, he remarked that the Masai in the Masai Reserve presented, as regards assessment and taxation, a totally different problem from that encountered in considering the case among agricultural tribes in the Protectorate. The Masai were pastoralists, whose mode of life, customs and requirements differed from those of agricultural natives. They required much more land than agriculturists, and had many fewer inhabitants to the square mile. Mr. Ainsworth, 29th April, 1915.

Statistics of the Masai Reserve estimated the population at 32,000 souls, the number of horned stock at 550,000 head, and of sheep and goats at 2,500,000 head, while the area of the reserve was approximately 9,000,000 acres. The annual taxes paid by the Masai amounted to Rs. 30,000 only. Mr. Ainsworth quoted, in comparison, the case of three agricultural districts, whose total area was 2,168,000 acres, whose population was 669,805 souls, and which paid Rs. 692,751 in hut and poll tax. [161] [231] [651] [131]

The capitalised value of Masai stock was so large as to make the natives worth about Rs. 937 per man, woman and child, and, supposing that this capital account turned over but 5 per cent. per annum, the annual earnings of the tribe would be worth Rs. 47 per head. The total personal wants were very small, while they paid less than one rupee each in annual taxes. It was therefore evident that the Masai did not contribute their fair share to the Protectorate revenue, and that some readjustment was necessary in their case. [434]

In regard to the manner in which the Masai should be taxed, Mr. Ainsworth observed that their nomadic habits and mode of building huts rendered the method of collecting revenue under a hut assessment a far more difficult matter than it was in the case of agricultural tribes. He also considered that any system of poll tax on able-bodied males would be equally unsatisfactory. He therefore proposed a scheme which had been put forward by Mr. Hemsted and which he outlined as follows :—

In order to find out the approximate taxable value of the Masai, the tax should be worked out on a percentage, based on the assessed unimproved value of the land. The amount due would be collected in the form of a cattle tax (ignoring sheep and goats). The acreage of the reserve being nine million acres, the unimproved value being assumed to be Rs. 3 per acre, a tax of 1 per cent. on the unimproved value would produce a revenue of Rs. 270,000. This amount would be divided amongst the total number of cattle estimated, and would amount to 54 cents. per head on half a million head of cattle. Mr. Ainsworth considered that there would be considerable difficulty in counting the cattle, and suggested

Prior to the meeting, Mr. Hollis visited the Uasin Gishu Native Reserve and several of the adjoining farms and obtained the following information. The Uasin Gishu Masai in this area numbered in all between 1,400 and 1,500 souls, and paid tax on 440 huts. They possessed 15,000 head of cattle and 25,000 sheep and goats. 4,000 head of these cattle were in the habit of grazing on land belonging to Captain Grogan, who received toll in bullocks at the rate of 1 per cent. per annum. There were 30 kraals on Lord Delamere's land, containing 3,000 head of cattle, which were allowed this privilege without payment. The remaining 7,000 or 8,000 cattle were for the most part in the Native Reserve.

Statistics of the Uasin Gishu Masai. 648* 231 [162] [651]

The two reserves occupied by the Uasin Gishu Masai in February, 1911, were separated by a strip of alienated land, and steps were taken to re-acquire parts of adjacent farms belonging to Captain Grogan which would join these two areas and form one native reserve having an area of some 40,000 acres. The Masai were informed that, when this reserve had been allotted to them, they must regard the question of boundaries as definitely settled. They were also given to understand that, in lieu of hut tax, they would be required to pay a cattle tax of R. 1 per head or a stock tax of one beast out of every herd of 100 cattle, sheep or goats.

Further extension of the reserve. 648* 311

In July, 1911, the Provincial Commissioner, Naivasha, reported that dissensions had occurred between Chief Lembere and the hereditary Laibon, Walikondi, leading men in the Masai Reserve. Lembere had been constituted Chief by Mr. (now Sir Frederick) Jackson when he was stationed at Ravine and had acquired a considerable following. Charges of witchcraft had been brought against Walikondi, with the result that he requested permission to move, with the other Masai, from Laikipia into the Southern Masai Reserve. His following expressed a desire to accompany him. It seemed, however, that such a movement would be the cause of friction between the Uasin Gishu and the other Masai, who have little in common, and it was decided to hold the matter over, at any rate until the Masai Move was an accomplished fact.

Dissensions between Lembere and Walikondi. 648* 578 754 791

In May, 1912, the sanction of the Secretary of State was requested to an exchange of land held by Captain Grogan in the Naivasha Province for an area on the Athi Plains. Captain Grogan was willing to exchange 16,638 acres, to be used for an extension of the Uasin Gishu Masai Reserve, for 30,000 acres on the Athi Plains. The Secretary of State approved this arrangement in June, 1912, and the Provincial Commissioner, Naivasha, was instructed to take steps to mark out the extended Uasin Gishu Masai Reserve. 648*

A description of the Uasin Gishu Masai Native Reserve was accordingly drawn up, and read as follows:—

Uasin Gishu Masai Reserve boundaries. 648* 131

"The reserve is divided into three parts:

"No. 1. Commencing at the point where the Nakuru Eldama Ravine Road crosses the Enarosuro (or Nassour) River the boundary follows the right bank of this river down stream to its junction with the Esageri (or Sageri) River; thence along the left bank of the Esageri River up stream to the point where it is crossed by the Nakuru Eldama Ravine Road; thence along this road in the direction of Eldama Ravine to the point of commencement.

"No. 2. Commencing at the point where the Esageri River is crossed by the Nakuru Eldama Ravine Road the boundary follows that road in the direction of Nakuru to the most northerly corner or portion L.O. 487; thence in south-westerly direction along the western boundary of L.O. 487 to its intersection with the eastern boundary to L.O. 502; thence northerly and westerly along the eastern and northern boundaries of portion L.O. 502 to the Esageri River; thence along the right bank of the Esageri River down stream to the point of commencement.

"No. 3. Commencing at the most westerly corner of portion L.O. No. 486 on the Eldama Ravine Road the boundary follows the western boundaries of L.O. 485, 484, 483, 661 in a north-easterly direction to the most northerly corner of the latter (which is also the western corner of L.O. 662): thence in a south-easterly direction along the southern boundary of L.O 662 to the Molo River;

*648
131

thence along the left bank of the Molo River up stream to the point where it is crossed by the Nakuru Eldama Ravine Road; thence along the road in the direction of Eldama Ravine to the point of commencement.

"The following area, however, is to be excluded from this native reserve, viz., 500 acres situated as follows:—

"Commencing at the point where the Molo River is crossed by the Nakuru Eldama Ravine Road the boundary follows this road in the direction of Eldama Ravine for about one and one-third miles; thence in an easterly direction for about half a mile; thence in a south-south-easterly direction to the Molo River, thence along the left bank of the Molo River up stream to the point of commencement."

*648 The Uasin Gishu Masai Pass Regulations, 1914.

On the 6th of April, 1914, Rules were introduced under the Native Passes Regulations, 1900, forbidding the Uasin Gishu Masai from proceeding out of the reserve set aside for the use of that tribe except under permit from a District Commissioner or Assistant District Commissioner.

Proposals for the removal of the Uasin Gishu Masai.

In August, 1914, proposals emanated from the Land Office recommending the removal of the Uasin Gishu Masai from the area reserved for them and throwing their reserve open to European settlement. The argument was that in the event of a railway passing through that part of the country, it would be a pity to allow this small and unprofitable tribe to occupy a tract of land so valuable from an agricultural point of view as the Molo River Reserve.

It was suggested that a place might be found for these people in the Southern Masai Reserve.

Action on these proposals was deferred by order of the Governor until various other important questions relating to native reserves had been settled.

*648 166 [628] The Uasin Gishu Masai in North Kavirondo District.

After the defeat of the Uasin Gishu Masai by the Laikipia Masai on the plateau during the latter half of the nineteenth century, numbers of the former tribe found their way into Kavirondo country and settled in the North Kavirondo area under the Nandi Escarpment. From that area they were moved further to the west in 1903. In 1907 they were located in all parts of the North Kavirondo district, some of the kraals being situated near the Uganda border. Periodically they asked to be allowed to take up separate and unoccupied grazing lands to the east of the district but those applications were opposed by the Provincial Commissioner, Mr. Ainsworth, who insisted that these Masai should remain mixed up with the Kavirondo.

When rinderpest broke out in North Kavirondo District in 1911, the District Commissioner allowed these people to move east with their cattle so that the herds might escape the area of infection and they used the opportunity afforded by this privilege in order to make an effort to achieve their desire to be allowed to reside by themselves under Masai conditions. Several manyattas moved into the Trans-Nzoya area.

The future policy in dealing with this section of the tribe was referred to the Governor for decision in March, 1913, and he directed that these Uasin Gishu Masai should be moved into the North Kavirondo District and placed under the control of responsible chiefs with a view to inducing them to mix with the neighbouring Kavirondo and to abandon their pastoral tendencies in favour of agricultural enterprise.

Steps were taken during March and April, 1914, to move these Masai from the eastern parts of the district and they were distributed in the various locations under the personal supervision of the chiefs concerned.

Appendix I.

Agreement, dated 10th August, 1904, between His Majesty's Commissioner for the East Africa Protectorate and the Chiefs of the Masai Tribe.

*648 166 We, the Undersigned, being the Lybon and Chiefs (representatives) of the existing clans and sections of the Masai tribes in the East Africa Protectorate, having, this 9th day of August, 1904, met Sir Donald Stewart, His Majesty's Commissioner for the East Africa Protectorate and discussed fully the question of a land settlement scheme for the Masai, have, of our own free will, decided that it is for our best interests to remove our people, flocks, and herds into definite reservations away from the railway line, and away from any land that may be thrown open to European settlement.

We have, after having already discussed the matter with Mr. Hobley at Naivasha and Mr. Ainsworth at Nairobi, given this matter every consideration, and we recognize that the Government, in taking up this question, are taking into consideration our best interests.

Now we, being fully satisfied that the proposals for our removal to definite and final reserves are for the undoubted good of our race, have agreed as follows;—

●[13] That the Elburgu, Gekunuki, Loita, Damat, and Laitutok sections shall remove absolutely to Laikipia, and the boundaries of the Settlement shall be, approximately, as follows:—

On the north, by the Loroghi Mountains.

On the west, by the Laikipia (Ndorer) Escarpment.

On the south, by the Lesuswa or Nyam and Guaso Narok Rivers.

On the east, by Kisima (approximate).

And by the removal of the foregoing sections to the reserve we undertake to vacate the whole of the Rift Valley, to be used by the Government for the purposes of European settlement. Further, that the Kaptei, Matapatu, Ndogalani, and Sigarari sections shall remove into the territory originally occupied by them to the south of Donyo Lamuyu (Ngongo), and the Kissarian stream, and to comprise within the area the Donyo Lamuyu, Ndogalani, and Matapatu Mountains, and the Donyo Narok, and to extend to Sosian on the west.

In addition to the foregoing, Lenana, as Chief Lybon, and his successors, to be allowed to occupy the land lying in between the Mbagathi and Kissarian streams from Donyo Lamuyu to the point where both streams meet, with the exception of land already occupied by Mr. Oulton, Mr. McQueen, and Mr. Paterson.

*648 In addition to the foregoing, we asked that a right of road to include certain access to water be granted to us to allow of our keeping up communications between the two reserved areas, and, further, that we be allowed to retain control of at least 5 square miles of land (at a point on the slopes of Kinangop to be pointed out by Legalishu and Masakondi), whereat we can carry out our circumcision rites and ceremonies, in accordance with the custom of our ancestors.

We ask, as a most important point in this arrangement, that the Government will establish and maintain a station on Laikipia, and that officers whom we know and trust may be appointed to look after us there.

Also that the Government will pay reasonable compensation for any Masai cultivation at present existing near Nairobi.

In conclusion, we wish to state that we are quite satisfied with the foregoing arrangement, and we bind ourselves and our successors, as well as our people, to observe them.

FL12 Masai FL12

361 decimation of the Masai of that part, through their intestine
166 wars—a fact that has caused them to retreat from the northerly districts, which are in dangerous proximity to the Wa-sûk.

131 The Masai country, so called, may be said to include the area lying between 1° N. lat., and 5° S. In breadth it is very irregular; but if we say that the average is ninety miles, we shall be pretty near the truth. In this, however, we are including several isolated areas occupied either by tribes wholly different from the Masai, or by the agricultural Wa-kwafi, who are mere off-shoots of the Masai.

132 The rainfall is very small over the greater part of this large area. Only an approximate guess, of course, can be given—but I think I am within the mark in placing the rainfall of the lower desert region at fifteen inches, and the higher plateau areas at from thirty to forty inches in the year. During the fourteen months in which I travelled in that region my caravan was not caught ten times on the march by rain,—a striking contrast to my experience in the region further south, where, for weeks together, rain was incessant. The rains are almost entirely confined to February, March, and April. The consequence of this insignificant rainfall is, as we have seen, that the lower plains are practically desert, though the soil is of the richest nature. There are absolutely no marshes, with their physical discomforts and poisonous exhalations breeding disease and death. The air is dry and invigorating, and though the days are hot yet the breezes blow with refreshing coolness, and a night of low temperature—and even frequently of intense cold—braces one up for the fatigues of the garish day. The contrast, indeed, is felt to be just a little too great, when you rise, shivering, in the morning, to see the grass covered with hoar frost, and then in the afternoon find yourself perspiring in the airiest of costumes, under a shady bush, with the temperature above 90° Fahr. The air, however, being so dry, I felt no inconvenience from these abrupt changes, and it was simply wonderful to see how the men would lie in the open air without a shred of clothing, and with the temperature at the freezing-point.

At the high altitudes of this plateau region, hailstorms of very great violence are of frequent occurrence, more particularly in the neighbourhood of the Aberdare Mountains. More than once caravans have been overtaken by them while on the march, and great numbers of the men killed by the

SECTION VII

THE MASAI EXTRA PROVINCIAL DISTRICT

GENERAL NOTE

MASAILAND constitutes an Extra Provincial District under an Officer in Charge, holding the powers of a Provincial Commissioner, with two District Commissioners, stationed at Kajiado and Narok. The legislation in force in other parts of the Colony applies to the District, but the Outlying District Ordinance, No. 25 of 1902, has also been applied to it, in order to provide a means for controlling immigration from other tribes, a matter to which, as will be subsequently shown, much importance is attached by Masai tribesmen. The area of the District is 15,177 square miles and the population was estimated in 1945 at 53,000.[1] The density is thus 3.4 per square mile.

The Masai District contains in its more northern section a considerable area of land which ranks for agricultural or pastoral purposes with parts of the neighbouring Highlands reserved for European use, though it is to be noted that the rainfall here is more variable than in the central part of the Highlands. The lower parts of the District have a lower and even more variable rainfall, with the result that there is an area, conservatively estimated at a little over 3,000 square miles, which is arid and for all practical purposes waterless.[2] But the value of the large area held by the Masai is not to be judged by its agricultural possibilities, for if the Masai no longer justify the character assigned to them by history as "a virile tribe of predatory nomads," they have at all events maintained their traditional habit of life as a pastoral people, and though there is some cultivation in the Nairage-Ngare area and also near Ngong, this forms only an infinitesimal part of the District, and is for the most part carried out by Kikuyu immigrants on behalf of the local Masai.

It is of interest to note that in 1904 the number of cattle was estimated at only 50,000 and the sheep and goats at 600,000. This may have been an underestimate, though it must be realized that the country was still to some extent suffering from the effects of the great rinderpest epidemic of 1890, which had entailed such catastrophic results both on the numbers and the military power of the Masai. By 1914 the estimate had gone up to 600,000 head of cattle and over a million and half sheep and goats.[3] The Masai herds suffered severely in the drought of 1933 and 1934, when their losses of cattle were estimated at over a quarter of a million. But a recent estimate has put the number of cattle at over 700,000, with 800,000 sheep and a large number of donkeys. The further increase in the number of cattle is to some extent affected by the existence of fly, which is prevalent on the South Kavirondo boundary, in the extreme west, and also in the middle area, where the Kajiado and Narok Districts join. But if the present estimate of the stock is correct,

[1] Kenya Colony Blue Book, 1946, page 252.
[2] There is a summary of the physical conditions of the district by L. James at page 49 of Africa, January, 1939, together with a useful bibliography.
[3] Administrative and Political History of the Masai Reserve, G. R. Sandford, 1918, page 3.

7: Hailey G-4 (No date) 1950 FL12 Masai FL12

491 233 the Masai must, considering their small numbers, have a larger potential capital per head than any other tribe in East or Central Africa.

563 167 Practically the whole population may be said to belong to the Masai tribe, though there are a small number of immigrants, numbering rather less than one thousand in all, ninety per cent. being Kikuyu. As shown above, they are for the most part employed by the Masai in the cultivation of the small area of land used for agricultural purposes. There has been a certain amount of intermarriage, but the penetration of the country by the Kikuyu is viewed with distrust by the Masai, and three Alien Committees have lately been established in order to consider measures for the control of alien immigration. An area 631 167 of 47 square miles (known locally as Olengurumee) within the Masai Native Land Unit was set aside in 1942 for "squatters" displaced from European farms, most of whom are Kikuyu.[1] But this area will remain politically separate, and it will not affect the position of the Masai as a homogeneous population.

563 Early records refer to the existence in Masailand of a number of Dorobo, of whom Masai tradition speaks as the original inhabitants of the country. When Europeans first came into contact with the Masai, part of the Dorobo were still leading a primitive life in the bush, while part served the Masai as herdsmen and in some cases had small herds of their own. These people have, however, now been absorbed by the Masai and are not readily distinguishable from them.

THE MASAI TRIBE

131 648 Reference will be found in the Chapter on Tanganyika to the circumstances in which the Masai tribe, as it existed in 1890, was cut in two by the international boundary drawn between Kenya and Tanganyika.[2] The area thus left to the Masai in Kenya, now estimated at 15,177 square miles, compares with the area of 18,470 square miles now held by the Tanganyika Masai, with an estimated population of 32,168, and a density of 1.7 per square mile. The [161] proceedings as the result of which the Kenya Masai were in 1911 placed in occupation of their present area have had a prominent place in the controversies connected with the alienation of native lands in the Colony, but it will be sufficient to refer here to the facts as summarized in paragraphs 633 to 674 of 631 648 the Report of the Land Commission of 1933.[3] The Masai lands are now held as a Native Land Unit under the terms of the Native Lands Trust Ordinance of 1938 and the Kenya (Native Areas) Order in Council 1939. There is, however, one fact which differentiates the Masai lands from those occupied by other tribes under the terms of this legislation, or those held by the Tanganyika Masai. Whatever the judicial value of the Agreements made with the Kenya Masai in 1904 and 1911, it is held, in the words used by the Governor of Kenya in 1946, that they "have the validity of a Treaty."[4] If so, the terms of the Order confirming the Agreement of 1911 constitute a moral obligation to the Government to reserve these lands for the exclusive use of the Masai, "so long

Mbugwe are Bantu. There is also a small group of Tindiga, leading virtually a bushman life in the Lake Eyasi basin, to whom reference was made in Section I.[1] There would appear to have been a movement both northward and southward on the part of the tribes, who were previously contained in a very small area by the Masai invasion of the early part of the century.

THE MASAI DISTRICT

The Masai District forms the southern portion of the large block of country in Tanganyika and Kenya, extending to no less than 21½ million acres in extent, occupied by the Masai tribe, whose numbers were given in the 1951 Census as 46,945 in Kenya and as 47,276 in the 1948 Census in Tanganyika. There will be found in the Chapter dealing with Kenya Colony further reference to the tribal characteristics of the Masai, and it will be sufficient to give here only those facts which bear in particular on the position they occupy in Tanganyika.[2]

The southern movement of this tribe from the neighbourhood of Lake Rudolf seems to have come to an end about the middle of last century, but its spearheads had in 1890 penetrated as far south as the Great Ruaha River and even to Ulehe in the Iringa District, whence they were driven back by the Gogo and Hehe. There were many isolated Masai raids after that time, but these were in the main carried out by Kenya Masai, whose incursions were directed towards the coastal areas on the east, and indeed took them on occasion as far as Mikindani. The Masai settled in Tanganyika do not seem to have attempted a further movement of any importance into the neighbouring areas of the Territory.

The Anglo-German Agreement of 1890 cut the Masai country into two parts, roughly equal in area, though the population remaining under the British jurisdiction was somewhat larger than that which fell under German rule. The result was to make an effective division between the Kenya and Tanganyika Masai, and though the two sections have retained a community of racial interest, this has not extended to the political field. Such political unity as the Masai people possessed had existed largely for war purposes, and in peace time political as apart from religious authority was dispersed among the headmen exercising control over the groups having a customary right of pasturage in particular localities. There was moreover lacking in the case of the Tanganyika Masai a motive which might have led them to identify themselves with the Kenya Masai, namely, the need for protecting their lands from alienation by Government for the benefit of Europeans. The troubles created in Kenya by the efforts of Europeans to secure possession of Masai lands[3] were not repeated in Tanganyika, where the Masai have remained undisturbed in the occupation of the country they held at the period when European rule was established.

The present Masai District comprises, in the north, the Loliondo area, the dominant feature of which is the vast Serengeti plain, with the extinct volcanoes which mark its southern end. In the centre, south of the Rift Wall, the plateau type of country is characterised by volcanic hill masses, which provide a number of permanent water sources. In the South lie extensive thorn scrub steppes, with a low and very variable rainfall.

Practically the whole of the area included in the District is used only for pastoral purposes. If tradition is correct in holding that the tribe was once

THE SOUTHERN NILO-HAMITES[1]

INTRODUCTION

M
N
101
131
[563]

The Nilo-Hamitic peoples included in this volume form, in the main, two reasonably compact related groups: the Nandi, who live on the western edge of the Kenya highlands; and to the east of them, the Masai, whose land formerly stretched north and south for 400 miles along the Great Rift Valley. The Nandi-speaking tribes, homogeneous in culture, are derived from a common stock; and their culture has in turn a good deal in common with that of the Masai. Distributed through the highlands occupied by the Nandi and Masai are the scattered hordes[2] of Okiek, more commonly known as Dorobo or Wandorobo, the forest-dwelling hunters who preceded the present native inhabitants of Kenya Colony and northern Tanganyika Territory. The racial position of these Dorobo is uncertain: some people regard them (I believe erroneously) as early Nilo-Hamites; but since they have derived their present language and much of their culture from the Nandi, they are entitled to a place among the Nilo-Hamites.

T
101
197

The Tatog division of the Nandi group is separated from the rest of the Nandi-speakers, and lies close to the edge of the southern Masai; these people are included with the Nilo-Hamites on the score of language alone, since at present there seems to be no evidence of physical or cultural connection between them and the rest of the Nandi group. The languages, however, are unmistakably related, and therefore justify their inclusion here.

000

The third group, described as "unclassified," has been included because the peoples embraced by it live on the fringe of the Nilo-Hamites and would otherwise have been left out of the Ethnographic Survey altogether, since they cannot be fitted into any East African group under any existing scheme of classification. For these reasons it is considered that their appearance here is justifiable. The Iraqw and their congeners are sometimes described as Hamitic; but this attribution is by no means certain, nor has it yet been possible to classify their languages in spite of the availability of material, and for the present they must be left as "unclassified." The Hadzapi are "bushmen"—wild hunting people of the bush; and the Sandawe seem to be analogous to the Hottentots. These have a number of links with the Bushmen and Hottentots of South-West Africa; but they belong territorially to East Africa.

N
M
105

The majority of the Southern Nilo-Hamites are pastoralists practising (with the exception of the Pastoral Masai) a little agriculture, intensely conservative, devoted to their cattle, and regarding the rest of the world with contempt, a condition from which even now many of them are but slowly emerging. These characteristics help to explain such things as the absence of any extensive development of trade, and the lack of headway made among many of them by missionary efforts. In pre-European days they not only lay outside the slave trade, but largely controlled the ordinary coast trade to the highlands; hence Islam did not appear among them.

NOMENCLATURE

I. Nandi Group

N
T
101

There is no general term which is used by the people themselves to cover the main Nandi-speaking group, but (1) all Dorobo call themselves Okiek, sing. Okiot, though they have no horde-names of their own; (2) the term Tatog(a) is a group name covering eight tribes of which the Barabaig are the largest.

[1] For the relationship of the Southern Nilo-Hamites to the other Nilo-Hamitic Peoples, see *Ethnographic Survey*, East Central Africa, Part VI.

[2] The reasons for choosing this term "horde" are given in my paper "The social institutions of the Dorobo," *Anthropos*, 1951, XLVI, p. 2.

13:Huntingford E-4 (no date) 1953 FL12 Masai FL12
TATOGA FN26

group: Kipkurerek, Tindiret, Loldiani, Ravine, Western Mau, Eastern Mau; Central group: Dundule, Saleta, Kidoq, Digiri; Eastern group: Mt. Kenya, Kisima; Southern group: Mosiro. The western, central, and eastern groups are all in Kenya, the southern in Tanganyika Territory. 000

The Tatog division comprises:[6]

1. Barabaig: call themselves Barabaik, sing. Barabanda; the sing. primary form is Baraban; the plur. primary Baraba has not yet been recorded. 2. Gisamajenk. 3. Dororojek. 4. Darawajek. 5. Buradik. 6. Simajek. 7. Rotageienk. 8. Gidanwodik. T 101

The Tatog (Tatoga) are called Taturu by their Sandawe and Bantu neighbours; this is said to be a corruption of Tatog. They are called Il-Maŋati, sing. Ol-Maŋatinta (= "the enemies") by the Masai, and this term has crept into some of the literature.

II. Masai Group

The Masai as a whole call themselves Il-Maasai, sing. Ol-Maasani.[7] There is some uncertainty as to the nomenclature and tribal divisions of the Masai. It is clear, however, that they are not a single tribe, but a group consisting of a number of pastoral units called *il-osho*, sing. *ol-oshon*, or sub-tribes, which were associated in major units which may be called tribes and were the political units. These tribes and their sub-tribes may be provisionally set out as follows: M 101

Northern Masai:

1. Il-Aikipiak, sing. Ol-Aikipiani. Written also Laikipya, Laikipia, and even Lykipia.
2. Il-Wuasin-kishu, sing. Ol-Wuasin-kishui. Commonly written Uasin Gishu, and formerly Guas Ngishu from the mistaken idea that it meant "river (*guaso*) of cattle," whereas it means "striped cattle."
3. I-Sampur, sing. O-Sampurri; commonly written Samburu or Sambur. Called by the older travellers Burkeneji (*i-loo-ibor-kineji* = people of the white goats).

Central or Rift Valley Masai: M

4. Il-Kinopop, sing. Ol-Kinopopi, a grouping of three *il-osho* called Il-Purko, Il-Damat, and Il-Keek-o-nyokie. Il-Purko has been Europeanized into Elburgon, and Kinopop into Kinangop. [131]
5. Il-Kaputie, sing. Ol-Kaputieni, a grouping of three *il-osho* called Il-Kaputie, Il-oo-do-kilani, and Il-dala-le-kutuk. The first is also written Kapiti, Kapte; the second is the Dogilani of the older travellers.
6. I-Loitai, a grouping of the I-Loitai and I-Siria, to which latter belong the laibons of the il-Aiser clan.

Southern Masai:

7. Il-Kisonko, sing. Ol-Kisonkoi, generally written Kisongo, the Masai of Tanganyika Territory.

All these are Pastoral Masai; the first two no longer exist as separate tribal entities: the Il-Wuasin-kishu were broken up about 1850, and lost their laibon; though they have now been re-formed under their old name, this is due to the action of the British Administration. The Il-Aikipiak have also lost their land and their separate identity. M 175 648

The Agricultural Masai are known as I-Lumpua, sing. O-Lumpuani, commonly M 101

[6] Information from Mr. Gordon Wilson.

[7] *il* and *ol* in Masai names and words are the plural and singular article respectively (feminine, *in*; sing., *en*). The Wuasin Kishu pronunciation is Maasae.

13:Huntingford E-4 (no date) 1953 FL12 Masai FL12
Nandi FL13
Tatoga FN26

M 101 written Lumbwa; and as Il-Oikop, sing. Ol-Oikopani, written variously Loikop, Loikob, Eloigob, and even Leukop. The Kenya Masai call the pastoral Masai of Tanganyika, Kisonko, and the Agricultural Masai of Tanganyika they call Il-Arusa, the people known in Tanganyika as Arusa being a strongly Masaiized group of basically Pare (Bantu) origin. The name Il-Tiamus, sing. Ol-Tiamusi, written also Enjemusi, Njamusi, Njemps, etc., refers to the Agricultural Masai at the south end of Lake Baringo.

The name Wakwafi, Wakwavi applied by the Swahili to the Masai does not, it seems, really distinguish agricultural from pastoral, and the distinction made by Krapf in 1854 is more apparent than real. The word is derived from the Masai *(in-)kuapi*, pl. of *enkop*, "the countries," and from it come the names used of the Masai as a whole by (*a*) the Bantu, e.g., Kikuyu, Kamba, *A-Kabi;* (*b*) the Nandi group: Dorobo, *Ipkuapek;* Kony, *Ipkopek;* Keyo, *Kipkopek;* Nandi, *Ipuapek*.

III. Unclassified Peoples

500 1. Hadzapi: call themselves Hadzapi, sing Hadza. They are called WaTindega by the Isanzu, and WaKindiga and Kangeju by others.

2. Sandawe: call themselves Sandawe, sing. Sandawe'a.

3. Iraqw: call themselves Iraqwa, sing. Iraqutu. Other forms used by Europeans are Irak, Irakw, Erokh. They are also called WaMbulu, which is thought to be derived from the Swahili *mbulu*, "a person who says meaningless things because of madness or weak intellect"; and the district is known as Mbulu.

4. Gorowa: call themselves Gorowa. Also known as Goroa, and sometimes as Fiome, Fiume, from Mount Ufiome (Ufiume).

5. Alawa: call themselves Alawa; also known as Wasi.

6. Burungi: call themselves Burungi.

GROUPING

M T 131 Most of the Southern Nilo-Hamites live in the highlands of Kenya Colony; the southern Masai (Kisonko) and Tatoga are found in the northern part of Tanganyika Territory.

N 131 133 The Nandi group (Group I) is found in two concentrations: (i) to the north-east of Lake Victoria; (ii) south of Lake Eyasi.[a] The Dorobo are scattered over the forested parts of the highland area. The *Nandi division* of the group is mainly west of the Rift Valley on all sides of the Uasin Gishu plateau, at the north-west corner of which is Mount Elgon, on whose lower slopes live the Kony and Pok in Kenya, and the Sapei and Sapaut in Uganda. East of Elgon, and at the north-east corner of the plateau, are the Suk, living partly in the hill country north-east of Kitale, and partly in the low country farther east. South of the Suk, on the western edge of the Rift Valley, and along the east side of the plateau are the Marakuet, Endo, and Keyo; east of the Keyo are the Tuken or Kamasya. The Keyo country is a long, narrow strip consisting of high grassland and forest along the top of the escarpment, the precipitous slope of the escarpment itself, and the valley of the Kerio lying some 4,000 ft. below the summit of the escarpment. The south end of the Keyo country adjoins the hill country of the Mau, in the forests of which live a number of Dorobo hordes, those labelled Kipkurerek, Tindiret, Ravine, Loldiani, West Mau, and East Mau. From the Mau the southern Nandi escarpment runs eastwards towards Kavirondo Gulf, almost coinciding with the equator, and above this escarpment the Nandi country stretches northwards, with the small tribe of N 101 Terik adjoining it on the south-west. South of the escarpment is the Kipsikis country. The Nandi-speaking peoples thus enclose the open grassland where the

[a] There is in addition a number of scattered pockets of Tatoga between Lake Eyasi and Lake Victoria.

13:Huntingford E-4 (no date) 1953 FL12 Masai FL12
Nandi FL13
Tatoga FN26

Il-Wuasin-kishu Masai (Uasin Gishu) lived till they were broken up about 1850. The Nandi tribes are surrounded by other Nilo-Hamites (Karamojoŋ, Turkana, Masai) on the north, east, and south, and by the Bantu Kavirondo (AbaLuhya) and Nilotic Kavirondo (Luo) on the west.

Immediately to the east of the Nandi group lies the territory of the Masai (Group II), in and on both sides of the Rift Valley, stretching from Samburu in the north to about 6° south in Tanganyika Territory. In the north are the Sambur (Samburu) and, formerly, the Il-Aikipiak (Laikipia) east of the Rift Valley, with the old Uasin Gishu country enclosed by the Nandi west of the Rift. To the south of the Il-Aikipiak are the central Masai, comprising the Il-Kinopop extending right across the Rift Valley, the Loitai and Siria west of the Rift Valley, and the Il-Kaputie. These are the Kenya Masai. The country of the Tanganyika Masai, consisting of the Il-Kisonko and Il-Arusa, lies between Lolgorien on the west and Kilimanjaro on the east, narrowing as it goes southwards. There are settlements (*in-kurman* = farms) of the agricultural Masai from Lake Natron southwards. The Masai are bounded on the north and north-west by tribes of the Nandi group and by the Turkana; on the north-east by the scattered Randile and Borana; on the east by the Kikuyu and Kamba, Caga, Pare, and Shambaa (all Bantu tribes); on the south by the Bantu Kaguru and Nguru; and on the west by the Iraqw, Burungi, Shashi, Kurya, Gusii, Kipsikis, and Nandi, and by a short stretch of Bantu Kavirondo between Nandi and Elgon: the Nandi and Bantu Kavirondo were the neighbours of the Il-Wuasin-kishu who now no longer live here.

Scattered over the highlands are the Dorobo hordes (the *Dorobo division* of the Nandi group) which are found in four main concentrations: (i) Western, in the Mau forests (East Mau, West Mau, Ravine, Loldiani, Tindiret, and Kipkurerek hordes); (ii) Central or Rift Valley (Dundule, Saleta, Kidoŋ, and Digiri hordes); (iii) Eastern (hordes on the slopes of Mount Kenya and Kisima); and (iv) Southern, consisting of the Mosiro of the Talamai hills east of Kibaya in Tanganyika Territory. The Dorobo hordes are thus in contact with Nandi, Tuken, Keyo, Kipsikis, Masai, and Kikuyu: in spite of this, their language is in all cases a dialect of Nandi, though in some places where they are losing their identity (as in the case of the Kidoŋ) their Nandi speech is being forgotten and is in process of being replaced by Kikuyu.

The *Tatog division* of the Nandi group is separated from the nearest Nandi-speakers (the Kipsikis) by 200 miles of Masai territory. The Barabaig (Barabaik), the only tribe of this division of which we have any detailed knowledge, occupy the country in the triangle formed by Mount Hanang and Lakes Basotu and Balangida south of Lake Eyasi. They live in an enclave surrounded by Nilo-Hamites (Masai) and Bantu (Kaguru, Gogo, Nyamwezi, and Sukuma); in this enclave live also the Bantu tribes Isanzu, Nyiramba, and Nyaturu; the Bush people Hadzapi; the Sandawe; and the unclassified though supposedly Hamitic Gorowa and Iraqw.

The Hadzapi, Sandawe, Iraqw, and Gorowa are grouped together here as "unclassified" (Group III) in order to bring them into the Survey, for they cannot otherwise be easily fitted in, having no known relationship or specific cultural affinities with any other East African peoples.

All the Southern Nilo-Hamites are pastoralists, though most of them except the pastoral Masai practise a certain amount of agriculture. The Nandi group are mainly people who live in hilly country, though they are not mountaineers, and their land must be such that cattle can be kept. The Masai on the other hand are plainsmen and accustomed to open country. While the Nandi tribes lived and fought in all kinds of country, not minding bush so long as it was not too thick for cattle, though they avoided forest, the Masai were at a disadvantage once they got out of the open country. The Tatoga are also (it would appear) plainsmen. The Dorobo are forest-loving hunters, till recently dwelling inside the forests; they have shown a tendency to become pastoralists with some agriculture. The Hadzapi are "Bushmen," inhabitants of bush country, and like the South African Bushmen have shown no sign of changing their way of life. The Sandawe are hunters who have

Original Masai Reserves, 1904.

Extension to Northern Reserve, 1906.

Extended Masai Reserve which superseded the two reserves, 1911.

DEMOGRAPHY

161 Population figures for 1919 and 1941 were estimated as follows, the 1941 figures including an estimated 10,000 Sambur:

	Kenya	Tanganyika		Total
1919	43,000	—		—
1941	60,000	Pastoral :	37,000	
		Agricul.	47,000	
			84,000	144,000

13:Huntingford E-4 (no date) 1953 FL12 Masai FL12

The 1948 census gives the following figures: 161

		Male	Female	Total
Kenya	Narok	17,055	17,755	34,810
	Kajiado	12,583	12,925	25,478
	Sambur	9,800*	10,200*	20,000*
	Il-Tiamus	1,734	1,689	3,423
		41,142	42,569	83,711

* Estimated.

		Male	Female	Total
Tanganyika Districts	Arusha	24,710	27,310	52,020
	Masai	23,271	24,005	47,276
	Mpwapwa	728	740	1,468
	Handeni	435	537	972
	Pare	826	747	1,573
		49,970	53,339	103,309
Total for Masailand		91,112	95,908	187,020

This shows only a small increase over the 1941 estimate for the Kenya Masai, when 10,000 Sambur are deducted; but it doubles the previous estimate for the Sambur and shows a substantial increase in the Tanganyika Masai.

The livestock estimates for the Kenya Masai are: 231 233

	Cattle	Goats and sheep	Donkeys
1919	750,000	2,000,000	10,000
1930	700,000 to 1,000,000	1,000,000	170,000

The figures for cattle among the Tanganyika Masai are 500,000,[5] but these may be underestimated. They vary in fact from about 600,000 to 750,000 according to season and other factors.[6]

The total area of Masailand in Kenya and Tanganyika is about 41,000 square miles or 26,240,000 acres (15,000 square miles or 9,600,000 acres in Kenya, and 26,000 square miles or 16,640,000 acres in Tanganyika). After deducting 3,000 square miles or 2,000,000 acres from the Kenya Land Unit as being useless on account of bush or tsetse fly, the Kenya Masai have about three acres per head of stock which is shared with sheep and goats; whereas in country such as theirs cattle alone require anything from three to five acres per head, owing to the low rainfall, poor grazing, scarcity of rivers, and frequent droughts. Their Land Unit is also a Game Reserve. 131 311

PHYSICAL ENVIRONMENT

At the height of their power in the middle of the 19th century the Masai occupied a stretch of country which covered some 500 miles from north to south, and, at its widest, 150 miles from east to west. The northern limit was approximately Lake Sukuta (now mud flats), 20 miles south of Lake Rudolf; the southern, Lenjoge, near 175 131

13:Huntingford E-4 (no date) 1953 FL12 Masai FL12

175 Kiteto, some 50 miles south of Kibaya in Tanganyika. The most northerly Masai
131 were (and still are) the Sambur, who in 1888 extended more than 120 miles north-
wards towards Lake Stefanie. This vast country, with an area amounting to some
13 80,000 square miles, now reduced to one-half its original size, has great varieties of altitude, climate, rainfall, and vegetation. There are three vegetation zones: the first or northern has desert scrub and a desert type of grass; the second or medium zone has thorn bush and medium grass; the third or highland zone has evergreen forest, parkland, and tall grass. In Kenya, the altitude of Masailand ranges from 5,000 to 8,000 ft., though in the highlands which lie between Mounts Kenya and Elgon in zone 3 the land in some places rises to 10,000 ft. Most of the present Masai Land Unit is in zone 2; part of the extreme northern territory of pre-European times is in zone 1. In Tanganyika, the Masai territory is at a lower altitude, ranging from 6,000 to 4,000 ft. and including the isolated mountains Kilimanjaro and Meru. Much of this country is unfertile, and belongs to zone 2. In Tanganyika Masailand, there is one permanent river, the Ruvu or Pangani, on the eastern boundary; there are a few seasonal rivers, but for their main water supply the Masai depend on wells, water-holes, and springs. Since only the third zone is well watered, and most of the Masai live in zone 2, their life is conditioned to a great extent by the water quest, and in the worst areas a form of transhumance is practised. In the present Masai Land Unit in Kenya, the rivers are few, and the rainfall low. Most of the few large rivers run close together in bush country useless for grazing; the main rivers, too, rise in the Mau and unite less than halfway across the Land Unit in one stream, the E-wuaso ŋiro. There are no lakes except the soda lakes Magadi, Natron, and Manyara, though in the northern part formerly occupied by the Masai is the chain of lakes Baringo, Hannington (salt), Solai, Nakuru (salt), Elmenteita, and Naivasha. The Rift Valley, in which these lakes lie, runs right through Masailand from south to north. In many places the floor of the valley is a wide grassy plain; in others, as in the Kerio Valley, it is narrow with high precipitous walls. The rainfall is low, the average for the eight years 1915–17 and 1930–4 at Narok being 18 ins., with a range of 47 ins. to 12 ins. It is recorded that at Longido in one year there fell only 8 ins., three of them in one night. With such a rainfall, grazing cannot be anything but scanty. The average rainfall recorded by three gauges in the Masai steppe between Kibaya and Arusha for nine years is 24.4 ins. There are two seasons, the dry weather from June to November, followed by short rains in November and December, after which there may be rain in January and February (January: 1915, 0.00 in.; 1916, 4.20 ins.; 1917, 9.44 ins.; February: 1915, 1.48 ins.; 1916, 5.09 ins.; 1917, 5.23 ins.; though in 1918—a dry year in Kenya—there was only 0.28 in. in February). The dry weather is called "the months of hunger" by the Masai. The recognized wet season is from March to May, "the months of plenty," though small amounts of rain may fall in other months, notably June to August, which are called "the months of showers." The figures given for Kenya refer only to Narok, and in the more arid parts there is not only less rainfall, but the small precipitation out of season has little effect on grazing or water supply. Except in the highland zone, where there is some seasonal variation, day temperatures vary only between 60° and 65° F.

Agricultural Masai

In 1932 the Il-Tiamus numbered about 2,250 (3,423 according to the 1948 Census), and though they are of Masai stock, being descended from a Sambur section called Il-Doigio, they have admitted a variety of refugees including Kamasya, and become rather mixed. According to von Höhnel they had originally four villages at the south end of Lake Baringo, but two were deserted on account of Masai and Suk raids, and some of the inhabitants, having lost all their cattle, took refuge on Kokua Island in Lake Baringo. They are expert swimmers and possess canoes, though von Höhnel saw none in 1887. Their dwellings are round huts with rather high-pitched and somewhat convex thatched roofs, and walls of posts and sticks. These are crowded into two permanent villages known as "Njemps Kubwa" and "Njemps Ndogo" in the Tigrish valley a few miles south of Lake Baringo; the closely packed huts almost touch each other, and the mud-walled granaries are surrounded by strong palisades.

In general the Il-Tiamus keep as close as they can to the dress and customs of the pastoral Masai; they have circumcision and *eunoto* and other ceremonies, and practise the "free-love" system of the pastoralists, though without the *manyatas*. Today they have some 180,000 acres of poor land, most of it unfit for cultivation; but they have acquired, since the establishment of British rule, some 12,000 or more head of cattle, and 30,000 goats and sheep, thus achieving in part the ambition of all Il-Oikop to become cattle people again. In the time of Thomson and Teleki, however, Njemps was an important station on the caravan route, and von Höhnel noted that they had a large extent of cultivated land. This was divided into blocks (he says of three to four miles square) which were intersected by irrigation channels bringing water from dams across the river Tigrish. This system was still working in Dundas's time, who says that the opening of the main ditch was performed with the sacrifice of a sheep at the mouth of the ditch.[13] Besides agriculture, the Il-Tiamus fished and hunted, using the bow, and spears of Suk and Turkana types.

It is possible that the fishing group called Il-Molo who live on the east shore of Lake Rudolf is to be classed as Il-Oikop.[14] They subsist on a diet of fish alone which, when Teleki and von Höhnel saw them in 1888, had produced no ill-effects; but it seems now to have resulted in considerable physical degeneration, and in the appearance of rickets in all members of the group. There seems to be a good deal of Gelaba blood in them.

The Il-Arusa round Mount Meru are a large tribe of agricultural Masai, originally of Bantu stock, but now accepted by the pastoral Masai as worthy of recognition as a group which can pay and receive cattle for compensation in cases of homicide. The Baraguyu in Southern Masailand are also to be classed as agricultural Masai.[14]

SOCIAL ORGANIZATION AND POLITICAL STRUCTURE

Social Organization

Life Cycle

From birth to circumcision a male is a boy, *ol-ayioni*. At circumcision[15] he enters an age-set and becomes a warrior, *ol-murrani*, "one who is circumcised," and may associate with unmarried girls. At the *ol-gesher* ceremony he becomes an elder, *ol-moruo*. Warriors may marry when they become senior warriors. After the *ol-gesher* the newly made elders attend to their family concerns, and get wives

000 The East African steppes as habitation area of the Masai people. -- Their immigration in three corps. -- Their battles. -- Division and distribution of the land among Masai, Wakuafi, Wandorobo and their attitude toward one another. -- Influence of the Masai people on the sedentary tribes. -- Mixture with Negroes. -- The somatic characteristics of the three branches of the Masai people show their racial connections, the ethnographic ones their social connections.

• 131 Between the 34th and the 38th degree of longitude and the 3rd degree north and the 7th degree south latitude, in German and British East Africa, we find large steppes, which are often designated as the Masai steppes after their inhabitants. They are bounded by hilly lands that are mostly thinly populated, especially by sedentary Negro tribes, and are more or less well cultivated.
133 The terrain formation of the steppes is sometimes flat, sometimes undulating or rolling, sometimes hilly and, in this case, usually determined by volcanic activity. This stands out especially drastically on the Kenia /Mt. Kenya/, Kilimandscharo /Kilimanjaro/, Meru, and Ol Donjo l'Eng ai, on the latter of which, for example, on a narrowly circumscribed space /6/ between the steep slope of the Mutiek Plateau, the Gilef and Timbati mountains, hill follows hill and almost every one bears or conceals the ruin of a crater, a landscape such as we are familiar with from photographs of the moon.

13 [182] The extent of the steppes, in connection with the existing amount of precipitation and water sites, made them a more than adequate region for a stock-raising nomadic people. The very saliferous soil produces excellent fodder grasses and provides salt licks in countless places.

17 131 As far back as the history, the memory and tradition of the people of these regions extend, and certainly still many, many centuries longer, these steppes were, and are up to the present
174 day, the arena of the Masai people. On the migration, or, more accurately, slow push, they came from the north, out of the

Figure 1. Masailand. The Western Wall of the Rift Valley Divides Western Masailand from Eastern Masailand.

INTRODUCTION

121 Within the past century the grassland ecosystems of Africa have been as much altered as those of the rest of the world. The assemblages of plains wildlife of which Roosevelt (1910) wrote in such wonder have now almost disappeared. One area, however, has remained largely unaffected by "progress."

101 The Serengeti-Mara region covers some 20,000
*133 square miles of open or wooded plains land, rolling hills
• [131] and flat prairies, lying across the Kenya-Tanganyika border just east of Lake Victoria. Most of the region lies in Western Masailand, and much of the part outside the Masai land unit is in Tanganyika's Serengeti National Park.

Topographically Western Masailand is well protected. The Great Rift Valley forms the eastern boundary of this region, and on the south the Rift plus the Ngorongoro Highlands provide a barrier; the north is protected by the Mau Escarpment, and on the west the Siria Escarpment and Lake Victoria form a discontinuous but effective boundary (Fig. 1).

101 The Masai tribe has provided the other major protection. Before the White Man arrived -- but only just

PRESENTATION AND DEFINITIONS

128 An ecological study is difficult to organize for presentation, since all the component parts are interrelated. The problem is to find a starting point. This difficulty is emphasized in a study as broad as this one. The form that has been adopted is as follows:

1. To provide a general description of the area and its significance to this type of study.

2. To describe, in turn, the various component parts of the ecosystem, treating each component separately but defining its relationships with the other components.

3. To bring the components together with a discussion of the nature of the ecosystem and its historical implications.

Methods used in the field collection of data are mostly described where appropriate in the text. The basic methods that apply to the entire study, however, do not belong in any one section, and these are described in the chapter on Compilation of Data.

130 131 <u>Masailand</u> is the term normally used in East Africa to denote the Masai administrative land unit, which includes about 15,000 square miles in Kenya and 136 137 some 23,250 square miles in Tanganyika. The term

19: Talbot E-4,5 (1956-1962)1964 FL12 Masai FL12

THE PHYSICAL SETTING

(31
133 The Serengeti-Mara region in Western Masailand is a fan shaped piece of land covering about 20,000 square miles. The wide end of the 'fan' lies in the east along the edge of the Great Rift Valley and the narrow point in the west at Lake Victoria (Fig. 1). The eastern edge averages about 6,000 feet elevation with occasional hills and plateaus rising to about 8,000 feet. There is a gentle, irregular slope westward to the lake region at 3,750 feet elevation. The Mau Escarpment and Ngorongoro Highlands rise to over 10,000 feet to the north and south.

Drainage is generally westward into Lake Victoria, the two major exceptions being the Southern Guaso Nyiro River which forms part of the boundary of the region in the north, and which runs south-easterly into the Rift; and the Olduvai Gorge and its watershed which forms an enclosed basin with no outlet at the base of the Ngorongoro Highlands.

Geology

133 The Great Rift, or Gregory Rift Valley, has been described in detail by Jaeger (1911, 1913), Gregory (1921), Willis (1936), and Uhlig and Jaeger (1942). The two

174 160-200 miles airline north of Western Masailand, and
174 it is a desert at present. A tribal elder called
773 Maasinda found a way to climb the escarpment at the south
of Kieru and some of the tribe then moved into the Kenya
614 Highlands. The legendary Maasinda had six sons who
became the founders of the present six Masai clans.

The tribe gradually moved south. At Ngong, near Nairobi, according to their traditions they found a Heaven-born child who became their first Laibon
174 or Medicine Man (Hollis, 1905). Fosbrooke (1948) dated the arrival at Ngong at 1640 on the basis of the geneology of the Laibons founded by that legendary first child. During the next 150 years the Masai moved over 300 miles airline southward.

131 175 1800-1890: By 1800 a few Masai had made what proved to be the tribe's maximum penetration into Tanganyika but it was not until about 1880 that they had completed their occupation of what is now the Masai Steppe in Tanganyika (Fig. 1). There had been constant warfare and raiding involved in this settlement, and the margins of Masailand fluctuated somewhat. For a time the Masai occupied the area immediately south of the Ngorongoro Highlands, as well as lands near Mt. Kilimanjaro and Mt. Meru that are now in other hands.

[See p. 9a.--Analyst]

175
177 The people whom the Masai displaced in Tanganyika were mostly pastoralists. There were also some small tribes who practiced irrigated cultivation near the Rift wall and on some mountain flanks. Those who immediately preceeded the present Masai may have been related to them, and they, in turn, evicted prior residents. Some of these early people dug wells and built dams, but Fosbrooke (1948) believes that except for irrigation systems on some mountains, these waterworks were for pastoralism rather than agriculture. There were also isolated tribes of metal workers in the south who may have provided the Masai with spears and knives.

In the study area, the Masai occupation of the
[131] Ngorongoro Highlands and the Serengeti Plain was probably
175 completed by 1850. A people called the Il Datwa
648 occupied the highlands and much of the rest of the area, both north and south of Ngorongoro. These were probably both pastoralists and cultivators. Another similar tribe, the Sonjo, lived near the foot of the Rift near Lake Natron.

Somewhere between 1836 and 1851 the Masai drove the Il Datwa off of the Crater Highlands and the Serengeti Plain. The limestone wells of the eastern

175 [643] Serengeti are said by the Masai to have been dug by the Il Datwa, and they still call the Ngorongoro Highlands "Osopago lol Datwa" in memory of the people from whom they took the area. In the next 15 years the Masai took 175 • 131 the flat land immediately south of the highlands. Then, until about 1890, several section and sub sections of the Masai occupied the entire Serengeti Plain, the Ngorongoro Highlands, and the lands immediately west of the Rift. They lost the land south of the highlands through incursion of the tsetse fly, just as they lost other lands to the east and south of the present Masailand.

During the period of 1860 to 1890 the Masai were a prosperous tribe and they probably reached their maximum land holdings and cattle numbers. The area they occupied extended roughly 500 miles from north to south and 150 miles from east to west, an estimated 175 80,000 square miles. Under the leadership of their para- 721 mount Laibon, Mbatian, they raided from Lake Victoria to the Indian Ocean. Sanford (1919) and Simon (1962) quote excerpts from the writings of many early explorers referring to the extent and effect of these Masai raids. The raids were not confined to other tribes, however. Some of their more devestating battles took place between different sections of the Masai themselves.

175 161 In terms of total population the Masai have greatly prospered under European administration. It has been estimated that at the peak of Masai power, before 1890, the total population of Masai was around 45,000 (Simon, 1962). By the mid 1920's they had recovered from their series of disasters and their numbers were estimated at about 50,000 (Joelson, 1928). The census of 1948 gave the total Masai population as 107,309 (Fosbrooke, 1948). The most recent census places the population at about 117,000.

175 648 Most of the Masai prosperity in the 20th century has taken place under the English administration. In 1891 the boundaries of the German Territory of Tanganyika stopped short of what is now Tanganyika Masailand, but it was included in the German "sphere of interest." [657] (Kiepert, 1891). Subsequently, apparently because there were so few Masai living in Masailand following their multiple disasters, the Germans created a Masai Reserve that was mostly south of an east-west line through Arusha. This division left the Ngorongoro Highlands, the Loliondo area, and the highlands near Eastern Masailand free for European settlement and displaced the Masai living there. [131] This action further scattered the remnants of the Masai, some of whom moved north into Kenya and others south into

175 648 131 the German Masai Reserve. After the 1914-18 war the English allowed the Masai to return to most of the areas they formerly occupied in Tanganyika.

175 648 After defeating his brother, Lenana returned to Kenya and in 1902 he peacefully acknowledged British rule. The Masai were still very few in numbers but they ranged over a wide area of Kenya, grazing their cattle and raiding. In 1904 two Masai reserves were created, 175 648 657 131 a northern one of some 4,500 square miles in the Laikipia area, northeast of Western Masailand, and a southern one of about 4,350 square miles which included part of the present Eastern Masailand in Kenya. The Masai, led by Lenana, signed a treaty accepting the reserves in August 1904. This arrangement did not prove satisfactory for either the Masai or the English. Lenana found it difficult to control the northern Masai when he was in the south and requested that the reserved be joined. Consequently, after several years of negotiations, a treaty was signed in 1911 in which the Masai gave up the 4,500 square miles of the Northern Reserve and received in return over 9,000 square miles of land including what is now the Kenya portion of Western Masailand. Part of this area was unoccupied, some of it was European ranch land, and part of it had been occupied in former times by Masai. This new half of the Southern

19: Talbot K-4,5 (1956-1962)1964 FL12 Masai FL12

175
648 Reserve became Narok District, with headquarters at
667 Narok. The remainder of the Southern Reserve was
131 Kajiado District, with its headquarters at Kajiado, about 45 miles south of Nairobi on the Great North Road (Fig. 1). The Provincial headquarters for both districts was located at Ngong, just west of Nairobi.

175
648 With subsequent extensions, the Masai in Kenya
131 received a total of over 15,000 square miles which included some of the finest grazing and forest land in Kenya.

Partisans of the Masai say that the treaty of 1911 was a catastrophy for the Masai and that they were tricked by government into giving up good land for bad. It is also pointed out, however, that as a result of the treaty of 1911 the Masai received over twice as much as they lost, and that land included some of the finest grazing and forest land in Kenya. The treaty was requested and signed by the Masai leaders. As a result of that treaty, their population density in the reserve was probably about one and one third persons per square mile, so in terms of land, this treaty made the Masai one of the richest tribes in Africa.

175 Regardless of the logic, the move was resented

175 strongly by many of the Masai involved. Few of those who made the move are still living, but the memory of
175 it is kept alive by the Masai nationalists. The Masai in
181 Kenya's Western Masailand are, or are descended from,
184 those who made the move from Laikipia. They are characteristically more conservative and more distrustful of the government than other groups of Masai, and they attribute these attitudes to the move.

Fosbrooke (1948:11), an admirer of the Masai, attributes the conservatism of the Tanganyika Masai to their hardships from famine, pestilance, civil war, and German administration in this way:

> It is almost impossible to find at the present day an elder who did not go through considerable hardship in his youth. To anyone who has lost and regained a possession, such possession is of greater value, at least sentimentally. The Masai of Tanganyika lost their cattle, their mode of living and their tribal life, and largely by their own efforts have once again regained them. It is suggested that their intense conservatism and resentment of change may perhaps be better understood in the light of the foregoing.

175 During the German period the Masai were
648 largely excluded from the Western Masailand in Tanganyika,
131 although occasional raiding parties came through it. Between 1900 and 1905, according to Grant (1957), there was one Masai encampment or warrior's barracks

19: Talbot E-4,5 (1956-1962)1964 FL12 Masai FL12

175
648
131

at the Moru Kopjes on the western edge of the Serengeti Plain, just north of the headwaters of the Simiyu River (Fig. 3).[1] Western Masailand in Tanganyika is large and was virtually uninhabited by Europeans, so doubtless some Masai remained throughout the German period.

During the 1914-18 war the Germans retreated from northern Tanganyika. The Masai whom they had evicted began returning to their former grazing grounds. In addition, by the end of the 1914-18 war Masai from Kenya had penetrated the Serengeti region and the Ngorongoro Highlands. Part of these were from the Purko section, people who as a result of the 1911 treaty had moved from areas around Lake Naivasha to the Loita Plateau north of Loliondo. Others were of the Loita section who formerly lived on the Loita Plateau.

When the English took over Tanganyika as a Trust Territory after the 1914-18 war, they established all of Tanganyika Masailand as a single Masai District. Its headquarters were at Monduli, about 15 miles west of Arusha (Fig. 1).[2] In the study area the western boundary of the Masai District is the line between the Lake Province and the Northern Province (which includes the Masai District). This line was drawn by the Germans

[1] [See p.19.--Analyst] [2] [See p. 9a.--Analyst]

175 and it cuts through the Serengeti Plain roughly paralleling
648 the eastern border of the Serengeti National Park (Fig.3).
• 131 Grant (1957) notes that the line is an arbitrary one which did not take account of the actual distribution of the Masai. The Serenget section of the Masai formerly occupied the plains west of the line. When the Germans surveyed the area they apparently thought it uninhabited because the Masai had been dispersed by famine and civil war. After the 1914-18 war the Serenget Masai returned to the western Serengeti. They were then in Lake Province but they were so isolated from its administration that the District Officer for the Masai District at Loliondo handled their administration.

In 1920 the English administration evicted the immigrant Kenya Masai from Tanganyika in favor of the resident Kissongo section of the Tanganyika Masai. Since then the Kenya Masai have been moving southward again slowly.

*13 Early in German times the importance of the
648 unique wildlife concentrations in the Serengeti and Ngorongoro Crater were recognized (Grzimek and Grzimek, 1960a). During the period between the wars the Tanganyika Government created several nature reserves in the area protecting some of the wildlife from hunting, but not much affecting the Masai.

4: Kenyatta I-5 (no date) 1953
FL10 Kikuyu FL10
MASAI FL12

M or parties travelled mostly during the night and spent the daytime in hiding, eating and preparing for the attack. 726 After they located the cattle-pens they slept in a forest nearby until the dead of night, when they stealthily crept through the darkness and took the few herdsmen by surprise. The cattle-pens were surrounded and a few of the herdsmen killed to avoid any cry that would give the signal to the warriors of the enemy's tribe. The cattle were captured in this way and led away as quickly as possible, in a zigzag way, and at the same time some of the warriors were left behind to cover the trail and also to await the enemy who might follow; so that while they were engaged in fighting, the cattle would reach the starving families in Masailand. Sometimes it took some days before the raid was discovered, especially when the cattle were grazing far away from the homesteads.

K In this way the stock was lost and the lives of a few M herdsmen. We can therefore compare the "tribal war- 726 fare" with the "smash-and-grab" practised in civilised Europe and in America. The only difference between the two systems is that smash-and-grab is a frequent practice, whereas the tribal warfare was an occasional raid, with long intervals in between. In some parts of the Gikuyu country, especially in the centre of the country, a generation passed without experiencing any raid at all.

K Apart from the fighting strength of, say, the Gikuyu M or the Masai, there were natural features dividing the two tribes, such as huge forests full of all kinds of dangerous 131 wild animals and snakes, which made the forests a very effective blockade. Sometimes, it is said that a party of warriors entered in the forests and never came back again, not that they fell in the hands of the enemy, but that they lost their way and were either devoured by the animals or

4: Kenyatta I-5 (no date) 1953
FL10 Kikuyu FL10
MASAI FL12

K M 131

perished by starvation, thus feeding vultures and hungry hyenas. In places where there were no such natural barriers, and where the two tribes came into contact frequently, peace treaties were signed and friendly relations established. In this case intermarriages were one form of peace-making.

K M 728 581

K M 648 581

To take a concrete case, my grandmother, on my father's side, was a Masai woman called Mosana, and in reciprocity for this friendly feeling, my aunt (i.e. elder sister of my father) was married to a Masai chief called Sendeu, and was treated as the head-wife. Exchange visits were made on both sides, and I had the opportunity of visiting her and stayed there for some months as a member of the family.

K M 648 721

In territories where this friendly relationship was established, especially between the Kaptei Masai and the Southern Gikuyu, the warriors of the two tribes joined together to invade another section of Masai, like Loita or a section of Gikuyu, like Mbeere or Tharaka. This information was given to me by my grandfather, Kongo wa Magana, who led several of these attacks as a fighting warrior and later as a magician of war.

000

It can be said that the relation between one tribe and another was no more or less than the relations existing in the present day between various tribes of Europe and America. The only difference is that the relations between European countries involve great suffering for the majority of the people, either through economic fights, tariff barriers and distribution of wealth, etc., or through actual fights in battle-fields. The case of the Spanish Civil War, where one tribe is fighting between itself, or the case of Japan and China, where a strong tribe is trying to dominate a weaker one, are illustrations.

K 722

The raids in the tribal warfare affected only a few villages,

12:Dundas G-5 (ca. 1900) 1908 FL6 Dorobo FL6
Kikuyu FL10
Masai FL12

seen amongst them, and it is not difficult with a little practice to tell the particular division to which a Kikuyu belongs. Thus the people of Iriaini* have pronounced Masai features, and many of their chiefs are pure or half Masai by birth. This is due to the fact that when the Kikuyu invaded that district about forty years ago they found it occupied by the remnants of the Aikipiak and Dala-le-kutuk Masai, who owing to famines, raids, and other causes were too much weakened to resist them. The two tribes therefore settled down peaceably side by side, and by intermarrying formed one people.

Again, many of the Kikuyu clans claim descent from certain particular tribes; thus, the Anjiro and Chakamoyo clans say they are descended from the Shuka, the Akkachiko and Achera from the Kamba, the Aesaka from the Chaga of Kilimanjaro. Anyone enquiring into the descent of those present at a meeting of Kikuyu elders will find an extraordinary number of different tribes represented. One is a Maeru, another a Chaga, a third a Masai, a fourth a Shuka, a fifth a Dorobo, and so on.

The actual Kikuyu themselves are said to have come from two tribes called the Shagishu and Ngembe, both of which still exist as tribes somewhere beyond the Maeru country, north of Mount Kenia.

I cannot speak from experience of the Shagishu, but I have met a native of Ngembe whose appearance reminded me strongly of a Kikuyu. This man, who said he had never seen a white man before, told me that his country lay beyond Maeru and that he had come here to visit relatives. These same Ngembe are believed to have been originally Dorobo, and Karuri, one of the paramount chiefs of the Kikuyu, who is himself a Dorobo, claims descent from them. The Ngembe of the present day are probably analogous to the Kikuyu, *i.e.*, they are a mixture of Dorobo and some other tribe or tribes.

Many absolutely foreign tribes have had colonies in Kikuyu for shorter or longer periods. A tribe of coast people called Digo are stated to have lived for many years on the Tana River, in what is now known as the Fort Hall District.† Somali, Galla, Borana, or some other similar people effected a very strong footing in Kikuyu some fifty to seventy years ago. According to tradition they belonged to the Barabio Lokulala, Sigirai, and Endaramuroni clans,‡ and they had settlements at Nyeri, Naivasha, Kijabe, Punda Milia, and generally all over the Kikuyu country.

In those days the Aikipiak Masai occupied the Laikipia Plateau, the Purko Masai were at Naivasha, the Kaputiei in the Kidong Valley, and the Tarosero at Iriaini. The Dorobo, who were still the dominant tribe, occupied with the Kikuyu the present Kikuyu country.

With all these tribes the Somali or Galla lived in a state of chronic warfare.

The Larusa, a Kikuyu clan, and the Atwa, a Dorobo clan, unable to hold out any longer, migrated. The former have, it is said, preserved to this day their tribal identity and customs, and are still to be found somewhere in the vicinity of Kilimanjaro§; the latter near Mombasa.‖

The remaining tribes appealed for assistance against their oppressors to a great medicine man called Supi (or, to give him his correct name, Supeet), the grandfather of Lenana, the present Masai chief.

---

* The name Iriaini is said to be derived from 'N-Darosero ainei, my Tarosero women. Tarosero is the name of the most important clan in this particular section of the Masai.

† Mr. Hollis informs me that the Segeju, who have intermarried with the Digo, a sub-tribe of the Wa-Nyika, have a tradition to the effect that they once lived on the Tana River.

‡ Barabio is the Kikuyu, Sigiriaish the Masai for Somali and Galla.

§ Possibly the Arusha, who live on Mount Meru in German East Africa.

‖ By Mombasa the up-country native often means the coast generally. According to Mr. Hollis the Wa-Sanya call themselves, and are known to the Galla as, Watwa; sing., Wanya.

lost to the Masai as a watering place. Situated at an altitude of 4,000 feet it is flanked on the east by the Kikuyu Escarpment, and on the north-west by Mount Suswa. Water is not procurable during the dry season, but the area is used by the Masai during the rains when most of the available water then runs to waste. 133

The country between the Kedong Valley and the Uaso Nyiro at Van de Weyer's Drift, is cut up by deep escarpments and studded with ironstone hills, intersected by jagged edged dongas, all of a volcanic nature. The soil is, for the most part, a sandy orange dust. The hill sides are covered with rough thorn bushes and mimosa amongst which a considerable amount of good grass is apparent. The area is practically waterless at most times of the year, but the appearance of watercourses indicates the presence of large bodies of surface water during the rains. [134] [137]

Near the Uaso Nyiro lies the country known as Mosiro, level grass country, which affords permanent grazing for large herds of cattle all the year round on account of the proximity of the river and the consequent regular water supply.

To the east lies the country known as L'Odo Kilani, which is the northern extremity of the barren country round Lake Magadi.

The Uaso Nyiro, which is taken as the dividing line between the eastern and central portions of the Masai Reserve for the purposes of geographical description, flows into a swamp to the north of Lake Natron, which contains the lowest part of the reserve, being no more than 2,027 feet above sea level. The valley is fairly healthy in dry weather, but in the rainy season the inhabitants move westwards to the summit of the escarpment, which rises in a series of abrupt and rocky ridges on the right bank of the river from the Anglo-German boundary as far north as the Narosura River. The central portion.

West of this escarpment stand the Loita Hills, rugged masses extending over a wide area of country, watered by frequent streams, and of an altitude generally greater than 7,000 feet. These hills form the watershed of the tributaries of the Mara River, the chief of which in these parts is the Olkeju l'Ongaianet, which follows a course nearly parallel to the boundary and which enters the Mara River as it crosses the border. The Loita Hills present good grazing grounds, well supplied with water and grass, but they are too mountainous and rocky in places to be utilised to their full capacity.

North of the Narosura, and before reaching the Loita Plains, the Narosura Plains present grazing areas of the first quality, whose undulating slopes carry heavy crops of grass and are much frequented by Masai cattle. Permanent water is obtainable at regular intervals from the small tributaries of the Narosura.

The Loita Plains are entered at the Engare Ento and, though there is a deficiency of permanent water in this part, the grazing is otherwise good. The extensive areas comprised in the north-eastern portion of the Loita Plains consists of very open and bleak country, swept by cold winds, which send the temperature at night down to well below 40° F. and carrying a short close grass, which is more suitable for sheep than for cattle. The eastern boundary of the Plains is the Uaso Nyiro, which has not at this time entered into its deep ravine. At Van de Weyer's Drift the river is some twenty yards wide, running with a strong current between fairly high banks and of a depth varying at different seasons of the year, but rarely less than two or three feet deep at the drift. North of Narok Station the heights of the Mau rise through thick bush and forest country, well watered, but practically unusable for stock, to the top of the range and it is through this country that the Uaso Nyiro, with its tributaries, fall until they unite near the drift. [132]

West of the Narok lies the main portion of the Loita Plains, a vast area of open grass country, level, or slightly undulating, intersected with small watercourses, which hold water in the deeper cavities and in the neighbourhood of occasional springs at most seasons of the year, and dotted at intervals with copses of bush and scattered clumps of mimosa, a country which possesses magnificent possibilities as a grazing area if a few engineering projects are undertaken to

FL12 Masai FL12

133 Let us take the country first.

The Masai country is very markedly divided into two quite distinct regions, the southerly or lower desert area and the northerly or plateau region. The southerly is comparatively low in altitude, that is to say, from 3000 to nearly 4000 feet. It is sterile and unproductive in the extreme. This is owing, not to a barren soil, but to the scantiness of [132] the rainfall, which for about three months in the year barely gives sufficient sustenance to scattered tufts of grass. The acacia and mimosa have almost sole possession of those dreary plains, except near the base of some isolated mountain, or other highland where small rivulets trickle down, to be speedily absorbed in the arid sands. No river traverses this region, and many parts are covered with incrustations of natron, left by the evaporation of salt-charged springs. We have seen something of this lower region in the flat reach of Njiri, and the forbidding desert of Dogilani.

It is not, however, to be conceived as a monotonous level. Far from it. The colossal Kilimanjaro, and the conical Mount Meru belong to it. The hills of Gelĕi and the Guaso N'Ebor circle round in the form of an amphitheatre, to meet the metamorphic masses of Ndapduk and Donyo Erok. Further to the west and north are the volcanic masses of Donyo Engăi, Donyo la Nyuki, and Donyo Logonot, with the hills of Nguruma-ni.

Except in the immediate vicinity of the higher mountains, such as Mount Meru and Donyo Engăi, the country is to a large extent uninhabited. To summarize this tract we may say that it is triangular in general shape, the apex towards the north, reaching to within thirty miles of the equator, and extending beyond to Baringo as a species of trough or deep, irregular cutting. The Masai are only to be found at all seasons about such favourable situations as the base of [361] Kilimanjaro, Mount Meru, Ndapduk, Gelĕi, Kisongo, to the west of Meru, Donyo Engăi, and along the edge of the plain at the bases of the bordering highlands Maŭ and Kaptè.

The country is sufficiently characterized when the fact is stated that it is a region of later volcanic activity, which in a very recent geological period has produced the cones and craters already referred to. These results of volcanic energy may, to some extent, be accounted for—though the statement may seem to savour of reasoning in a circle—by the lower region as an area of depression having subsided or sunk from the higher level of the flanking table-lands.

6: Thomson K-3 (1883-1884)1887
FL12 Masai FL12

361 decimation of the Masai of that part, through their intestine
166 wars—a fact that has caused them to retreat from the northerly districts, which are in dangerous proximity to the Wa-sûk.

The Masai country, so called, may be said to include the
131 area lying between 1° N. lat., and 5° S. In breadth it is very irregular; but if we say that the average is ninety miles, we shall be pretty near the truth. In this, however, we are including several isolated areas occupied either by tribes wholly different from the Masai, or by the agricultural Wa-kwafi, who are mere off-shoots of the Masai.

The rainfall is very small over the greater part of this
132 large area. Only an approximate guess, of course, can be given—but I think I am within the mark in placing the rainfall of the lower desert region at fifteen inches, and the higher plateau areas at from thirty to forty inches in the year. During the fourteen months in which I travelled in that region my caravan was not caught ten times on the march by rain,—a striking contrast to my experience in the region further south, where, for weeks together, rain was incessant. The rains are almost entirely confined to February, March, and April. The consequence of this insignificant rainfall is, as we have seen, that the lower plains are practically desert, though the soil is of the richest nature. There are absolutely no marshes, with their physical discomforts and poisonous exhalations breeding disease and death. The air is dry and invigorating, and though the days are hot yet the breezes blow with refreshing coolness, and a night of low temperature—and even frequently of intense cold—braces one up for the fatigues of the garish day. The contrast, indeed, is felt to be just a little too great, when you rise, shivering, in the morning, to see the grass covered with hoar frost, and then in the afternoon find yourself perspiring in the airiest of costumes, under a shady bush, with the temperature above 90° Fahr. The air, however, being so dry, I felt no inconvenience from these abrupt changes, and it was simply wonderful to see how the men would lie in the open air without a shred of clothing, and with the temperature at the freezing-point.

At the high altitudes of this plateau region, hailstorms of very great violence are of frequent occurrence, more particularly in the neighbourhood of the Aberdare Mountains. More than once caravans have been overtaken by them while on the march, and great numbers of the men killed by the

6:Thomson K-3 (1883-1884)1887
FL12 Masai FL12

exposure; for the damp cold is singularly fatal to the coast natives, who, under its influence, drop down paralyzed, apparently utterly unable to make the slightest exertion to better themselves. On these occasions you may beat them with a stick till you are tired, but they will simply put their heads between their knees like an obstinate donkey, and whine out, "Si wezi," "Si wezi" (I am not able). On my return march at Mianzi-ni, to the east of Naivasha, one of these storms came on, accompanied with thunder and lightning of appalling fury and violence. The hail fell continuously for hours, and when it ceased the country was actually *white*, and remained so all night. If we had been caught out in that storm, without huts, I question very much if ten men would have survived. As it was, so utterly paralyzed were they that even in their huts they allowed their fires to go out, and they had literally to be compelled to bestir themselves. 132

So much for Masai Land. Let us now take up the deeply interesting subject of the inhabitants.

In dealing with the manners and customs of this remarkable race, I think I shall best picture them to the reader not by describing them in catalogue fashion, but by setting forth the prominent facts in the life history of a male and female Masai, tracing their career in the various epochs of their savage existence, and trying to understand their ideas of man and nature, and their sociological relations. 128

But first of all, let me say a few words more immediately descriptive of the Masai as a race. Learned philologists profess to have discovered from a study of the Masai language—and I suppose the theory may be accepted as correct—that it belongs to the Hamitic family, as does also the language spoken by the tribes of the Nile and North Africa. This seems to be the only clue to their family relationship, and it reveals very little. The reader, therefore, will clearly understand that the Masai are in no sense negroes, or allied to the Bantu tribes with which he is so familiar from the works of our most prominent later African travellers. In their cranial development, as in their language, they are widely different from the natives of Central and South Africa, occupying in the former respect a far higher position in the scale of humanity. 197 144

The Masai tribe is divided into about twelve principal clans or sub-tribes, with numerous smaller divisions. These have not all the same position in Masai society, some clans having more "blue" blood, and being reckoned of purer 614 565

6: Thomson K-3 (1883-1884) 1887
FL12 Masai FL12
Wa-Kwafi

M 184 between the married and the unmarried people, very little work being expected of the latter, and the sweetheart system being preserved. They all, however, occupy the same village, 262 and of course the young men cannot afford to live on meat, 184 though they always come in for the lion's share when any of it is going. When parties go off on war-raids, they also contrive to eat a bullock by way of getting up their courage.

578 They lead upon the whole a very miserable life, ever threatened with destruction by the Masai, who have swept off several villages and all their cattle. The soil being the 132 very richest loam, brought down from the mountains and 134 spread over a comparatively level plain to the south of the lake, it is capable of producing anything; only the extreme dryness of the air and the very small annual rainfall, confined to a couple of months, keeps it sterile and barren. 311 To ameliorate this unhappy condition of things the Wa-kwafi have developed a wonderfully ingenious system of irrigation by artificial canals of (for them) great magnitude. They construct dams across the deep channel of the Guaso Tigirish and thus raise the level of the water to that of the plain, and then, by an intricate network of channels, they spread 262 the precious fluid over a large area, and raise their millet 241 and melons. These products form almost their sole food, eked out by what they are able to kill in the chase and by fish from the river, though when meat is scarce they are not 136 disdainful even of rats. Of these there were simply 123 myriads. They swarmed everywhere, and nothing was too sacred for them. Need it be wondered if "oft in the stilly night" were heard imprecations loud and deep upon the wretched pests when I have been wakened up by my nose being bitten or the sanctity of my toe invaded. My books were devoured, and even the bullets in my cartridges were not too indigestible. Everything, indeed, had to be kept under iron or hung up under sheds as represented on page 313.

157 As in the case of the Wa-taveta, the Wa-njempe are singularly honest and reliable, so much so that valuable 123 goods and equally valuable food are left in their charge with the utmost confidence, and I have heard of no case of this being violated. To me, one of the most remarkable features in the character of the young women and girls was their absolute unconsciousness of fear in my presence, and the complete confidence they seemed to have in me. They indeed took

[pages preceding p. 167 not processed]

SECTION VII

THE MASAI EXTRA PROVINCIAL DISTRICT

GENERAL NOTE

MASAILAND constitutes an Extra Provincial District under an Officer in Charge, holding the powers of a Provincial Commissioner, with two District Commissioners, stationed at Kajiado and Narok. The legislation in force in other parts of the Colony applies to the District, but the Outlying District Ordinance, No. 25 of 1902, has also been applied to it, in order to provide a means for controlling immigration from other tribes, a matter to which, as will be subsequently shown, much importance is attached by Masai tribesmen. The area of the District is 15,177 square miles and the population was estimated in 1945 at 55,000.[1] The density is thus 3.4 per square mile. 63 [illegible]

The Masai District contains in its more northern section a considerable [illegible] neighbouring Highlands reserved for European use, though it is to be noted that the rainfall here is more variable than in the central part of the Highlands. The lower parts of the District have a lower and even more variable rainfall, with the result that there is an area, conservatively estimated at a little over 3,000 square miles, which is arid and for all practical purposes waterless.[2] But the value of the large area held by the Masai is not to be judged by its agricultural possibilities, for if the Masai no longer justify the character assigned to them by history as "a virile tribe of predatory nomads," they have at all events maintained their traditional habit of life as a pastoral people, and though there is some cultivation in the Naivasha-Ngare area and also near Ngong, this forms only an infinitesimal part of the District, and is for the most part carried out by Kikuyu immigrants on behalf of the local Masai. 311 563

It is of interest to note that in 1904 the number of cattle was estimated at only 30,000 and the sheep and goats at 600,000. This may have been an underestimate, though it must be realized that the country was still to some extent suffering from the effects of the great rinderpest epidemic of 1890, which had entailed such catastrophic results both on the numbers and the military power of the Masai. By 1914 the estimate had gone up to 600,000 head of cattle and over a million and half sheep and goats.[3] The Masai herds suffered severely in the drought of 1933 and 1934, when their losses of cattle were estimated at over a quarter of a million. But a recent estimate has put the number of cattle at over 700,000, with 800,000 sheep and a large number of donkeys. The further increase in the number of cattle is to some extent affected by the existence of fly, which is prevalent on the South Kavirondo boundary, in the extreme west, and also in the middle area, where the Kajiado and Narok Districts join. But if the present estimate of the stock is correct, 333 195 [931] 473 233

805 The 10th day, as tonnon ogpem, as the final day of the first decade.

The 15th day, as ol gudet and final day of the ede ober ol ahe.

[777] The 16th day, as ol onjat; it is the unlucky day for war and the initial day of on simmo (= the darkness).

[777] The 17th day, as ol onjagi; it is the most important unlucky day in daily life, but on the other hand, is regarded as a lucky day in
[784] war; on the ol onjagi people do not change dwellings, do not shave their heads, and do not undertake any circumcision.

The 18th day to 20th day, as on mbiala.

The 20th day, as on ekibuelle, on which the boys belonging to the El kibuelle lineage are circumcised, and as the final day of the second decade.

The 21st day to 23rd day, as ngeile.

[784] The 24th day, as initial day of the on simmo ganak; on it no sacrifices may be offered, and frequently too, just as on the subsequent on simmo ganak days, no circumcision is to take place.

The following days up to the end of the month, as on simmo ganak.

Within these days, the 4th, 10th, 17th, 24th, and 1st are again especially familiar.

/ 805 Three months form a season; four seasons, the year (ol ad). The
821 names of the seasons are
• 132 Ol dumerll, that is, the time of little rainfall, which precedes the great rainy season. This falls in the ed gokwa, named after the Pleiades, which then rise low on the western horizon.

/161/ Then follows the ol simolgoad, the season of the lighter after-rains, and then the ol ambil, the period of hunger, of drought.

The months of ol dumerll are: 1. ol gimoo, in which the goats and sheep bring forth young; 2. ol ekilio, that is, the heat of the sun; 3. ol gokwa.

The months of on gokwa are: 1. in ayat, formed from ar ratapgreen valley. The rain, which has fallen meagerly up to now, has been sufficient to cover with fresh green the valleys and deeper lying places in the otherwise still yellow, dry steppe. 2. on ayatano, the dark, gloomy one. The sky is cloudy, it rains a great deal, the days are gloomy and dark. 3. ol dardarua, formed from aemert = fat; the cattle soon become fat because of the young, fresh grass.

/160 cont./

805 The months of the ol airodjerod are: 1. le logunja airodjerod,
821 also called oilni oinok, that is, the tied-up bulls. As a result of the
• 132 rich fodder of the recent months, they have become wild: in the pasture they would be constantly fighting with one another, hence they are separated. 2. bolos (= middle) airodjerod, or also, but more rarely, called ol dit. 3. kudjorok, that is, cold: cool weather distinguishes this month.

805 The ol amili starts with the month kiber, that is, noise and
821 strife. The pasture is sparse and as a consequence the cows give too
132 little milk to satisfy all the people. Everyone tries to appropriate
261 for himself some of the milk from the livestock of others, through
262 which strife and brawls arise. Finally the milk no longer extends
[578] to necessitous satiation, and the majority of the warriors with a few cattle move into the forest for meat eating, which usually lasts not only through the entire month, but also even over the next month of ol dongos or ol dolos or ol dolgoch, since even then the milk is still very scant. The name seems to be formed from the word ol gaschusch = food scarcity. Not until the beginning of the third month, of the boschogge, do they return to the kraals. From the
[276] abundant meat meals they feel very strong, and the heavy use of nerve-stimulating roots has affected their nerves to a high degree, and almost daily one or another has a fit of rage (1).

1. Cf. XIX. Nerve Ailments.

805 The Masai do not count years. Rather, they designate the year after the event seeming to them the most important one that happened during it, for example, after a livestock epidemic, a drought, the death of the high chief, a war expedition especially rich in spoils, etc. (2).

[171] 2. Just as the Babylonians, even in the 3rd millennium B.C., did not count the years, but gave each year a name after an outstanding event in it, especially after the deeds of the king. One proceeded similarly

(122 easier to light more fires are lit, just as in the case
177 of hunting tribes who have received firearms; with game
372 easier to kill, more game is killed. Control in these
(122) matters appears to be enforced by availability of tools
and difficulty of accomplishment, not by any conservation
ethic.

132 We questioned Masai, other Africans, and
Europeans about lightning fires and never found the
slightest evidence of lightning causing fires in the
savanna country. There is no doubt that it ignites some
fires in rim-rock or mountain areas, but we never
even saw a lightning-struck tree in the study area.
All the lightning we observed in storms was high, it
occurred in heavy rain storms, or it was low in the
region of Lake Victoria.

122
232 There does not seem to be any discipline or
724 organization to the burning by the Masai. Fires are
233 started in dry grass when herds leave an area, but they
are also lit when herds arrive in an area, if the grass
is dry enough. They are even lit in pauses during rain
storms.

The forest country on the hills is also burned at

CHAPTER V.

A DESCRIPTION OF THE MASAI RESERVE.

(1) General division—Administrative division—Geographical division—General description of the Reserve—Southern Masai—Lake—The Rift Valley—Eastern portion—The central portion—The western portion.

(2) General division.

The present Masai Reserve, of which the boundaries have been defined in the preceding chapter, may be divided historically into four sections. The original Southern Masai Reserve has been in Masai occupation from before the time of European administration; the Extended Southern Masai Reserve, that is, roughly the country between the Uaso Nyiro and the Mara River formed the basis of the Agreement of 1911; the trans-Mara, or Ol-Chokai area was added subsequent to the Agreement, not being included within the terms of that treaty, and the eastern portion of the reserve, from the Ngong Hills to Kilimanjaro was added to the Masai territory by Sir Percy Girouard in signing the Agreement of 1911.

(3) Administrative division.

For administrative purposes, the reserve is divided into three districts, the boundaries of which, together with the reasons for this partition, are described in Chapter V., Section I.

(4) Geographical division.

For a geographical description of the reserve, three divisions may be taken, the Mara River and the Uaso Nyiro being the dividing lines between these sections.

(5) General description of the Reserve.

The Masai Reserve extends approximately from 36° 0' east longitude to 36° 15' east longitude, and from 0° 30' south latitude to 2° 15' south latitude. It is 200 miles long and 50 miles broad, and contains an area of some 14,000 square miles, or over nine million acres.

The Anglo-German border which, throughout 200 miles of its length forms the northern boundary of the Masai Reserve in British East Africa, divides the population inhabited by the Masai tribe into two portions of which the larger is in British territory, and does not itself conform to any tribal or social division of the Masai tribe.

(6) Mountains.

The highest point of the reserve is to be found at its northern extremity where the boundary crosses the Mau Range. In that part of the reserve adjoining Mr. Percy Cobb's land, an altitude of 11,000 feet is reached. Little of the rest of the reserve is more than 6,000 feet in height, the most considerable mountains or groups being in the eastern portion, Ol Doinyo Orok, 8,274 feet, an isolated conical, forty miles in circumference, which rises more than 4,000 feet above the surrounding plain, and is situated on the northern boundary of the reserve; the Ngong Hills, sixteen miles south-west of Nairobi, which attain an altitude of 8,000 feet; and Ol Doinyo Sirwakwa, 7,000 feet, a conspicuous outlier volcano, situated to the east of the Kedong Valley; in the central portion, the upper slopes of the Mau Range; the group of rugged mountains known as the Loita Hills, whose highest point is at an altitude of 6,000 feet; and the mountainous region along which passes the Anglo-German boundary; and in the trans-Mara area, the Tanja Mountains, and Mount Gelegele, on the borders of the Tuki country. In the south-east of the reserve, the boundary crosses the foothills of Kilimanjaro, but does not extend that mountain to a height greater than 7,000 feet above sea level.

(7) Rivers.

The only two considerable rivers in the reserve are the Uaso Nyiro, with its tributaries, and the Mara River. The Uaso Nyiro divides the reserve into two parts, running in a southerly direction in the neighbourhood of the 36th degree of east longitude. The river, rising in the Mau Range, and flowing into Lake Natron, falls some 5,000 feet in 140 miles, and is led in the first part of the course

133

[illegible] volcanoes, which rise in deep valleys from the heights of the Rift. [illegible] among these are the mountains known as Marsh, Hyrakon, Peel, Lakonyi, Gladys, Thurston and Sotiko. At latitude 1° 30' south, the Uasu River enters a deep gorge and flows sluggishly through swamps and tall grass from that point to Lake Rudolf, flanked throughout by the Kamasian Escarpment on its right bank. Right valley from the south, it becomes fast in a swamp, but its course is sometimes visible as far as the lake.

The Kara River also rises on the Mau, where it converges down in a south-easterly direction until, a few miles below the Kara Bridge, it has become dispersed. After crossing the Anglo-German boundary, the river proceeds due east until it reaches the Victoria Nyanza, seventy miles away.

Other less important rivers are the Gwi River, in the Lake-Kara country, which rises from Gilgaigis Hill, and finally flows into the Kaja near Lumagu Pass; the temporary river Kikoibiro flowing eastwards from Kikoongiyan and the Kilomagu flowing from Mount Gwik.

Lakes

There are no permanent lakes of water of any size within the country. Perhaps the most interesting feature of the country is found in the salt lake at Magadi, where deposits are now forming the object of commercial enterprise. Lake Amboseli is a bowl of water in the wet season, but dries up during dry weather.

The Rift Valley, which marks the termination of the lava plains of Kapsabet and Eldoret on the east, crosses the Mount Kenya from north to south from the Kedong Valley to Lake Natron. This valley, the Northern or Great Rift Valley, extends through East Africa from the Quelimane Sandbar to Alexandria, and shows to the Jordan Valley. "This valley," writes Professor Gregory, "has been formed by the subsidence of the block of material that was lifted in. As one flies, the surface of the volcanic plains to the east of the Rift Valley were seen, between with the similar plains to the west. Parallel ranges, hundreds of miles in length, broke across the scene: the block of material between these ranges sank, forming walls, in places, so precipitous that the Uganda Railway has had temporarily to use a cable-worked inclined railway for the descent into the valley from the Elburr plateau. The walls of the valley, however, are not always precipitous. The lake along which the subsidence occurred cut across rivers, valleys, and basins; and the character of the scenery that now bounds the valley varies with the proximity of the country on either side of the Rift Valley."[1]

Dealing more particularly with the geographical divisions into which the country is divisible, the central portion of the colony includes all the open plain, known as the Kitui Desert, situated to the east of the Chyulu Hills. This so-called desert is at an altitude of about 4,000 feet, and is covered with bush of a varying density. There is no surface water in it, but the bed of a stream, known as the Sand River, crosses it from west to east, a bed averaging two to three hundred yards broad, from which water can be obtained by digging. One branch of this underground watercourse appears to be the continuation of the Kaphalo River.

Further to the south, and at about the same altitude, lies the sparsely populated country at the foot of Kilimanjaro. This plain consists of sandy soil, impregnated with various salts, which renders difficult the growth of any vegetable. Here and there a few shrubs of water are to be found in the wet weather, surrounded by stage of grass, while considerable areas are covered with the white crust of soda and salts. The stream rises from Kilimanjaro on the southern face, and the small streamlets which are continually running from the snow line do not proceed further than this plain.

Perhaps the most remarkable feature of the Kitui Desert and the plains to the south is the quantity of grass which exists in these areas, and it must be remembered, in this connection, that that country forms part of the Southern Game Reserve.

Further to the west, the ground falls slightly to an altitude of under 3,000 feet at Lake Amboseli, and then rises to Mount Gwik. From this mountain the

[1] "The Problem of British East Africa" Royal Society's Rev. 1921.

133 one or two streams which are permanent and which run for some distance from the foot of the hill. The most important are the Rusunga and Kidangwi, but several other springs are to be found on the mountain itself. The upper portions of Mount Oleh, as well as the northern slopes are covered with good grass, suitable for grazing during the wet season, but the Masai usually proceed to the more permanent watering places in the dry season.

Following the line of the Longido-Kajiado road northwards, more broken country is encountered, with the Ngongonyiki and Ol Kesumbwa Hills on the right forming the eastern boundaries of the Kijiri plains. This part of the country is bare and barren with little grass, and water can only be obtained by digging. The road lies generally at an altitude of between 4,000 and 4,500 feet, and the first permanent water that is to be found is at Bukl. There are some perennial springs on the slopes of the Ronsonyoki and Ngongonyiki Hills. North of Bukl the country is covered with grass, and bears excellent grazing generally comparatively free from tsetse. To the east lies the broken country of the Rongai Hills, which contains numerous water holes, some of them permanent, but no permanent rivers. The line of the Magadi Railway is then reached, north of which lie the Kapiriri Plains, stretching north-eastwards into the Ulambin country. These plains are at an altitude of about 4,000 feet, and are covered with grass, though the ground is somewhat stony.

To the west the general view fairly uniformly to the Ngong Hills, Dalaya Lemayo, and the Dalaya Nanok. West of these heights lies the escarpment of lava rock, running north and south, which forms the eastern wall of the Rift Valley, and which is more or less clearly defined from the northern boundary of the Masai Reserve at the Kikuyu Escarpment to a north and south-eastwards direction to the Dalaya Nanok and the Tarakia Hills, thence north-eastwards past Longiri, to the Anglo-German boundary near Boundary Post 81.

East of this escarpment the country is at a much lower level, is barren, rocky and destitute of water. A few isolated hills rise up, but it presents the appearance of a rugged desert and is practically uninhabited. Descending from the escarpment, at a mean altitude of 6,000 feet, the general altitude of the foot is fully more than 4,000 while in the neighbourhood of Lake Magadi the country falls to 2,000 feet. To the north of the Lake stands Ol Doinyo, a mass of three or four peaks, of which the highest attains an elevation of 4,000 feet, and to the south there is a series of bluffs and ridges. Near Lake Magadi, and extending eastwards and northwards for some miles, there are the deposits of an old lake. These are encrusted with volcanic debris and have in places been overflowed by lava.

Southwards, and some fifteen miles east of the Ngong Hills, the country consists of a series of parallel valleys divided by rocky hill ranges, details of the mountain hill movement so definitely marked in the Rift Valley.

West of Lake Magadi the Rift Valley continues to be arid, broken only by Ol Doinyo, a hill which forms the Uaso Nyiro on the east at a height of 5,000 feet, but at the northern extremity of Lake Natron, a few miles north of the boundary, Ol Doinyo Lengai rises as isolated peak to an altitude of 6,000 feet, 2,000 feet above the average of the Uaso Nyiro at the mountain foot.

[illegible] The country to the east of the Uaso Nyiro, and lying in the Rift Valley, is undoubtedly the poorest portion of the reserve from a pastoral point of view. East of the Naivasha-Longido road, and in the higher Hills the country may be described as fair stock land, and though water is not plentiful, and though there are in general considerable distances to be covered between water holes, a considerable quantity of stock can be maintained on it by utilising the river areas during the wet season. Statistics show that this area has to feed support about [illegible] head of cattle and nearly [illegible] sheep.

There remains the country situated in the Rift Valley from the Kedong to the Uaso Nyiro. The Kedong River does not flow near the Masai Reserve, as a stream flowing above general range to the wet months and is, therefore,

but to the Band as a watering place. Situated at an altitude of 4,000 feet it is [illegible] 133
flanked on the east by the Kikuyu Escarpment, and on the north-west by Mount Suswa. Water is not permanent during the dry season, but the area is used by the Masai during the rains when most of the available water then runs to waste.

The country between the Kedong Valley and the Uaso Nyiro at Van de Weyer's Drift, is cut up by deep escarpments and studded with numerous hills, interspersed by jagged edged ridges, all of a volcanic nature. The soil is, for the most part, a sandy orange dust. The hill sides are covered with rough [illegible] 134
thorn bushes and extensive coverings which a considerable amount of good grass is apparent. The area is practically waterless at most times of the year, but the appearance of watercourses indicates the presence of large bodies of surface water during the rains. [illegible] 137

Near the Uaso Nyiro lies the country known as Brazza, level grass country, which affords permanent grazing for large herds of cattle all the year round on account of the proximity of the river and the consequent regular water supply.

To the east lies the country known as Little Kibos, which is the northern extremity of the barren country round Lake Rudolf.

The Uaso Nyiro, which is taken as the dividing line between the eastern and central portions of the Masai Reserve for the purposes of geographical description, flows into a swamp to the north of Lake Baringo, which contains the broad part of the reserve, being no more than 3,000 feet above sea level. The valley is fairly healthy in dry weather, but in the rainy season the inhabitants move westwards to the summit of the escarpment, which rises in a series of abrupt and rocky ridges on the right bank of the river from the Dagh-Gorman boundary on the north to the Nyankiro River. Escarpment areas

West of this escarpment stand the Lolia Hills, rugged masses extending over a wide area of country, covered by frequent streams, and of an altitude generally greater than 7,000 feet. These hills form the watershed of the tributaries of the Nero River, the chief of which in these parts is the Ilkaya (Ilkapitson), which follows a course nearly parallel to the boundary and which enters the Nero River as it crosses the border. The Lolia Hills present good grazing grounds, well supplied with water and grass, but they are too mountainous and rocky to place to be utilised to their full capacity.

North of the Narosura, and before reaching the Lolia Plains, the Narosura Plains present grazing areas of the best quality, whose undulating slopes carry heavy crops of grass and are much frequented by Masai cattle. Permanent water is obtainable at regular intervals from the small tributaries of the Narosura.

The Lolia Plains are entered at the Sugara Nero and, though there is a deficiency of permanent water in this part, the grazing is otherwise good. The extensive area comprised in the north-eastern portion of the Lolia Plains consists of very open and bleak country, swept by cold winds, which send the temperature on night down to well below 40° F. and carrying a short dry grass, which is quite suitable for sheep than for cattle. The eastern boundary of the Plains is the Uaso Nyiro, which has not at this time entered into the deep section. At Van de Weyer's Drift the river is some twenty yards wide, running with a strong current between fairly high banks and of a depth varying at different seasons of the year, but rarely less than two or three feet deep at the fords. North of Nanyuki Station the heights of the Mau are thrown back land and forest country, well watered, but practically unusable for stock, in the top of the range and it is through this country that the Uaso Nyiro, with its tributaries, fall until they enter near the fords. [illegible] 141

West of the Nanyuki lies the main portion of the Lolia Plains, a vast area of open grass country, level, or slightly undulating, interspersed with small volcanic cones, which hold water in the deeper crevices and in the neighbourhood of occasional springs at most seasons of the year, and dotted at intervals with copses of bush and scattered clumps of cactus, a country which possesses magnificent possibilities as a grazing area if a few engineering projects are undertaken to

133 [illegible] the permanent water supply. The area is well stocked, but there is no doubt that a larger herd of cattle could be carried there if such improvements were effected.

In the north-western extremity of the Lake Plains lies the Lonch Valley, the scene of certain engineering activities in the construction of dams and an area which was considered suitable for European occupation before it was decided to concentrate the Bond from Lubigan in the Schedule Southern Bond Reserve. This valley possesses no permanent watercourse but provides excellent grazing during the wet weather when water abounds. To the east stand the Lonch Hills, the highest point of which, Kidmont (Kidmont), rises to an altitude of nearly 1,000 feet, while to the south, Rights separates the Lonch Valley from the Bore River.

North of the Lonch Range lies the country known as Cherry, Surrey and [illegible], while on the west the country descends to the Longest Plain through which flows the Bore River. In the vicinity of Bore Bridge another lower hill is reached adjacent on both sides of the river, forming the southern extremity of the Chandlings Forest which acts as a buffer space between the Bond and Ends on the right bank of the Bore.

The Bore River area

The Bore River area of the Bond Reserve may be described as an elevated tableland at an average height of upwards 1,000 feet with a long central range of hills rising up 2 from south to north and there sweeping into a still higher plateau of an undulating surface, many of the extremes of which attain an altitude of about 1,200 feet. On the south, this plateau is terminated abruptly along the northern side by the Lonch Escarpment, leaving Bore about a thousand feet in the Bore River which flows at the base in a southerly direction. Through this area flows the Cool (Bogan) River, the small dispersed branch of which flow to the west of Gingalla and Bore almost directly southwards until it passes the long flat-topped hill known as Longgarren. It then turns east. The area is covered with bush in varying density but one half is two-thirds of the whole is excellent green land which is all within reach of one branch or the other of the Cool River.

[illegible] This portion of the reserve was previously occupied by Bond who was previously established by goldfields in 1881, while at the same time their cattle grazed in the upstream of Gingalla.

The surface was covered of rolling hills and valleys interspersed with well drained flats and smaller hills, the whole being heavily grassed with herbaceous vegetation and shadow grass. It is fairly well watered, especially near the tributaries of the Chandlings Forest, but there are also large tracts destitute of water or bush. The available water supply is ample for any number of stock.

The country area lies at a lower altitude and has an average rainfall of not less than 20 inches. The grazing is long and rank and there is bush area about one-third of it.

Between the Cool River and the Lonch Escarpment the country consists of change of bush with excellent grazing in the other parts. It is rather poorly watered but several dams and wells do not dry up altogether.

The country below the escarpment is fairly well watered and is used by the Bond in the dry season.

133 Let us take the country first.

The Masai country is very markedly divided into two quite distinct regions, the southerly or lower desert area and the northerly or plateau region. The southerly is comparatively low in altitude, that is to say, from 3000 to nearly 4000 feet. It is sterile and unproductive in the extreme. This is owing, not to a barren soil, but to the scantiness of [132] the rainfall, which for about three months in the year barely gives sufficient sustenance to scattered tufts of grass. The acacia and mimosa have almost sole possession of those dreary plains, except near the base of some isolated mountain, or other highland where small rivulets trickle down, to be speedily absorbed in the arid sands. No river traverses this region, and many parts are covered with incrustations of natron, left by the evaporation of salt-charged springs. We have seen something of this lower region in the flat reach of Njiri, and the forbidding desert of Dogilani.

It is not, however, to be conceived as a monotonous level. Far from it. The collossal Kilimanjaro, and the conical Mount Meru belong to it. The hills of Gelĕi and the Guaso N'Ebor circle round in the form of an amphitheatre, to meet the metamorphic masses of Ndapduk and Donyo Erok. Further to the west and north are the volcanic masses of Donyo Engăi, Donyo la Nyuki, and Donyo Logonot, with the hills of Nguruma-ni.

Except in the immediate vicinity of the higher mountains, such as Mount Meru and Donyo Engăi, the country is to a large extent uninhabited. To summarize this tract we may say that it is triangular in general shape, the apex towards the north, reaching to within thirty miles of the equator, and extending beyond to Baringo as a species of trough or deep, irregular cutting. The Masai are only to be found at all seasons about such favourable situations as the base of [361] Kilimanjaro, Mount Meru, Ndapduk, Gelĕi, Kisongo, to the west of Meru, Donyo Engăi, and along the edge of the plain at the bases of the bordering highlands Maŭ and Kaptè.

The country is sufficiently characterized when the fact is stated that it is a region of later volcanic activity, which in a very recent geological period has produced the cones and craters already referred to. These results of volcanic energy may, to some extent, be accounted for—though the statement may seem to savour of reasoning in a circle—by the lower region as an area of depression having subsided or sunk from the higher level of the flanking table-lands.

6:Thomson K-3 (1883-1884)1887
FL12 Masai FL12

The northerly or higher plateau region of Masai Land may be described as rising from an elevation of nearly 5000 feet on either side, and culminating in the centre at an elevation of little short of 9000 feet—although through this very line of highest elevation runs from the Dogilani plain the remarkable meridional trough which encloses the charming chain of isolated lakes, Naivasha, Elmeteita, Nakuro, and Baringo; and which, at the last-named place, begins to widen out till it assumes the characteristics of the southerly plain of Masai Land. 133

On the eastern half of this divided plateau rises, as we have seen, the snow-clad peak of Kenia—and the picturesque range of the Aberdare Mountains, which runs almost parallel with the central line of depression. A more charming region is probably not to be found in all Africa, probably not even in Abyssinia. Though lying at a general elevation of 6000 feet, it is not mountainous, but extends out in billowy, swelling reaches, and is characterized by everything that makes a pleasing landscape. Here are dense patches of flowering shrubs; there noble forests. Now you traverse a park-like country enlivened by groups of game; anon, great herds of cattle, or flocks of sheep and goats are seen wandering knee-deep in the splendid pasture. There is little in the aspect of the country to suggest the popular idea of the Tropics. The eye rests upon coniferous trees, forming pine-like woods, and you can gather sprigs of heath, sweet-scented clover, anemone, and other familiar forms. In vain you look for the graceful palm—ever present in the mental pictures of the untravelled traveller. The country is a very network of babbling brooks and streams—those of Lykipia forming the mysterious Guaso Nyiro; those of Kikuyu the Tana, which flows to the Indian Ocean through the Galla country; while further south in Kaptè the streams converge to form the Athi River, which flows through U-kambani to the Sabaki River.

Kikuyu occupies the higher areas of the eastern half of the plateau, cutting across it immediately south of the equator. Some of the higher parts are covered with a dense forest of bamboo; notably to the east of Naivasha, and between it and the Aberdare Mountains. Hence the Swahili name of one recruiting-place—Mianzi-ni (Bamboo Country). [137]

The greater part of Lykipia—and that the richer portion—is quite uninhabited, owing, in a great degree, to the 361 166

6: Thomson K-3 (1883-1884)1887
FL12 Masai FL12

844 the hut were gathered together the gossips of the kraal,
[845] mingling, so far as space permitted, with calves and goats. A number of large calabashes lay in one corner, and a coarsely-made earthen cooking-pot in another. Fleas in thousands skipped about, and the midwives had their time well taken up with the myriads of flies which pertinaciously would insist on cultivating personal intimacy with them.

The anticipated event passed over safely. Indeed, the whole affair was hardly thought worthy of remark, except on
[842] the part of the mother, who heard with deep pleasure that her offspring was a boy. Girls are sadly at a discount among the Masai. They would always prefer to have boys, but happily nature sees ahead a little, and takes care that a fair

[133]
[342]

MASAI KRAAL, DONYO LONGONOT IN DISTANCE.

supply of girls is provided. As there is no registrar or birth
846 column, I am totally unable to state when our hero first saw
852 the light. That, however, is a small matter. No particular ceremonies marked the occasion, and the happy mother was about next day, attending to her household duties as if nothing unusual had happened, the little stranger being warmly ensconced on her back beneath the bullock's hide which formed the mother's garment.

855 Babies are babies everywhere, and for the first year or two the embryo warrior grappled with the problem of life like a philosopher as he sucked his mother's milk. Then he spoke. Having next found his legs, he grew apace. Getting above mother's milk, he was soon exercising his incipient teeth on a huge chunk of beef. Now this was a very reprehensible indulgence on the part of our young friend, for it doubtless

7: Hailey G-4 (No date) 1950 FL12 Masai FL12

000 Mbugwe are Bantu. There is also a small group of Tindiga, leading virtually a bushman life in the Lake Eyasi basin, to whom reference was made in Section I.[1] There would appear to have been a movement both northward and southward on the part of the tribes, who were previously contained in a very small area by the Masai invasion of the early part of the century.

THE MASAI DISTRICT

131 The Masai District forms the southern portion of the large block of country
161 in Tanganyika and Kenya, extending to no less than 21½ million acres in extent, occupied by the Masai tribe, whose numbers were given in the 1931 Census as 48,945 in Kenya and as 47,276 in the 1948 Census in Tanganyika. There will be found in the Chapter dealing with Kenya Colony further reference to the tribal characteristics of the Masai, and it will be sufficient to give here only those facts which bear in particular on the position they occupy in Tanganyika.[2]

174 The southern movement of this tribe from the neighbourhood of Lake Rudolf seems to have come to an end about the middle of last century, but its spearheads had in 1830 penetrated as far south as the Great Ruaha River and even to Uhehe in the Iringa District, whence they were driven back by the Gogo and Hehe. There were many isolated Masai raids after that time, but these were in the main carried out by Kenya Masai, whose incursions were directed towards the coastal areas on the east, and indeed took them on occasion as far as Mombasa. The Masai settled in Tanganyika do not seem to have attempted a further movement of any importance into the neighbouring areas of the Territory.

175 The Anglo-German Agreement of 1890 cut the Masai country into two
101 parts, roughly equal in area, though the population remaining under the British jurisdiction was somewhat larger than that which fell under German rule. The result was to make an effective division between the Kenya and Tanganyika Masai, and though the two sections have retained a community of racial interest, this has not extended to the political field. Such political unity as the Masai people possessed had existed largely for war puposes, and in peace time political as apart from religious authority was dispersed among the headmen exercising control over the groups having a customary right of pasturage in particular localities. There was moreover lacking in the case of the Tanganyika Masai a motive which might have led them to identify themselves with the Kenya Masai, namely, the need for protecting their lands from alienation by Government for the benefit of Europeans. The troubles created in Kenya by the
[C48] efforts of Europeans to secure possession of Masai lands[3] were not repeated in Tanganyika, where the Masai have remained undisturbed in the occupation of the country they held at the period when European rule was established.

131 The present Masai District comprises, in the north, the Loliondo area, the
133 dominant feature of which is the vast Serengeti plain, with the extinct volcanoes which mark its southern end. In the centre, south of the Rift Wall, the plateau
[312] type of country is characterized by volcanic hill masses, which provide a number of permanent water sources. In the South lie extensive thorn scrub steppes, with a low and very variable rainfall.

311 Practically the whole of the area included in the District is used only for
101 pastoral puposes. If tradition is correct in holding that the tribe was once

000 The East African steppes as habitation area of the Masai people. -- Their immigration in three corps. -- Their battles. -- Division and distribution of the land among Masai, Wakuafi, Wandorobo and their attitude toward one another. -- Influence of the Masai people on the sedentary tribes. -- Mixture with Negroes. -- The somatic characteristics of the three branches of the Masai people show their racial connections, the ethnographic ones their social connections.

131 Between the 34th and the 38th degree of longitude and the 3rd degree north and the 7th degree south latitude, in German and British East Africa, we find large steppes, which are often designated as the Masai steppes after their inhabitants. They are bounded by hilly lands that are mostly thinly populated, especially by sedentary Negro tribes, and are more or less well cultivated.
133 The terrain formation of the steppes is sometimes flat, sometimes undulating or rolling, sometimes hilly and, in this case, usually determined by volcanic activity. This stands out especially drastically on the Kenia /Mt. Kenya/, Kilimandscharo /Kilimanjaro/, Meru, and Ol Donjo l'Eng ai, on the latter of which, for example, on a narrowly circumscribed space /6/ between the steep slope of the Mutiek Plateau, the Gilef and Timbati mountains, hill follows hill and almost every one bears or conceals the ruin of a crater, a landscape such as we are familiar with from photographs of the moon.

13 The extent of the steppes, in connection with the existing
[182] amount of precipitation and water sites, made them a more than adequate region for a stock-raising nomadic people. The very saliferous soil produces excellent fodder grasses and provides salt licks in countless places.

17 As far back as the history, the memory and tradition of the
131 people of these regions extend, and certainly still many, many centuries longer, these steppes were, and are up to the present
174 day, the arena of the Masai people. On the migration, or, more accurately, slow push, they came from the north, out of the

Ill. 5. Kraal on the steppe between Kilimandscharo and Meruberg.

342 out of material available everywhere. Like every task in the
[462] kraal, hut construction is the duty of the women. After the site for the individual hut (Fig. 3) is cleared of grass and brush and then leveled, the spiral-oval ground plan is undertaken in that the woman scratches it on the ground with her foot. They do not
[804] use any auxiliary means for measuring it; measuring by eye is sufficient for the woman who, even as a child, helped her mother with this work. Into the ground plan, at foot-long intervals, poles
342 (ol ōmi, el ōm) about 1 1/2 meters long are stuck in the ground
335 and joined lattice-like with thumb-thick cross-switches (ol gereni, el gerenen). Then in the longitudinal diagonal seven to eight supports (em bogischi) are dug in, over which a longitudinal bar (ol ereschena, el ereschenan) is put from one end of the hut to the
[284] other. Over this the poles are arched and the opposite ends lashed
[824] together with papyrus grass (es sedja). By interplaiting finger-thick switches (en jaschoi, n jascho) walls /24/ and roof are made
342 tight. The lattice-like framework is about 1 1/2 to 1 3/4 meters high, 4 to 5 meters long and 3 meters wide. Neats' skins served
[237] principally for roofing before the rinderpest raged among the
[731] livestock around the year 1890. Now, /Figs. 2 and 3 appear here/
[824] when the Masai herds have become vanishing small in contrast
[237] to former times, the switch framework is first packed with a layer of dry, long-bladed grass (ol gudjeda or ol godjeda) 15 to

MASAI HERDS AND MARA LIONS

For 177 648

Westerners the Masai have become the symbol of a vanished aristocracy, a lost cause they can afford to keep as a household pet who has the spunk to stand up to its master.

The Masai way of life is certainly doomed. For a while it may continue, but nothing in the end can resist the pressures of Western materialism. The British have protected it by freezing a tribal pattern of land ownership, enshrined in a treaty to which the Masai hold with all the desperation of a man clinging to a raft when the waters are rising. That treaty, which confirms them in possession of their grazing-grounds 'for ever', was made to keep out Europeans. Now it is no longer white settlers who threaten them, but black ones. Will a treaty made for the one purpose serve for the other? Only while the British enforce it; when politicians of the land-hungry Kikuyu and Luo peoples occupy the seats of power in Nairobi, the borders of Masailand seem unlikely to remain intact.

For here lie the last reserves of fertile, well-watered and unused land in Kenya, hitherto protected by the strongest guardian of the land in Africa: the tsetse fly. In the last ten years, modern techniques of mastering tsetse-borne diseases, and the tsetse fly itself, have reached a point where all this land could be thrown open to settlement. The question now is partly one of expense, and partly of politics. The Masai themselves do not cultivate. So long as their treaty with the British Government holds good, they will resist to the last man the opening of their land to settlement by the cultivating tribes.

311 648 [136]

II

The Tanganyika–Kenya border cuts through the Masai's territory, most of which is open, semi-arid grassland useless for any purpose other than seasonal grazing by scrub cattle, even if water could be tapped by boreholes. But in the west, where Masailand approaches Lake Victoria, and on the Mau escarpment's south-western slopes, soil and rainfall would support a sizeable population of cultivators.

133 ●

The Masai, numbering about 85,000, keep about one ooo

21:Huxley Q.T-5 (no date) 1960 FL11 Luo
Masai FL12

imbecility—or perhaps not remarkable, since nothing has been more characteristic of the half-century of European intervention in Africa than the slap-happy introduction of bright, well-meaning ideas by enthusiasts of all kinds, without any regard for their long-term consequences.

Anyway, vets controlled diseases, livestock multiplied and their hoofs and mouths destroyed the precarious grass cover of the plains. The result is that, except where the tsetse fly remains in control, the Masai are living in country poised upon the edge of deserthood. Some of it has gone over the edge, some hovers on the borderline, some has not reached it yet. And so pressure mounts upon those regions that are still protected by the tsetse fly.

Overcrowded people outside want to get in, overstocked Masai themselves want to take their herds where grazing is still rich and deep. If either succeed, unless they adopt very different methods, they will destroy those regions as surely as they have damaged their present inheritance. Agricolas and vets do not want to see these last remaining areas opened up without strict control. But governments are terrified of controlling anyone by what may be represented as harsh measures, and administrators have inclined to caution since the Masai speared to death a D.C. who was persuading them to sell some steers. So the matter, like many others, rests in a state of suspended flux, and everyone hopes for good rains.

III

Down on the Kenya–Tanganyika border, not so very long ago, there lived an Englishman who kept in touch with the world by carrier-pigeon. For three or four months of the year no vehicle could reach him, and even in the dry weather it was a long, hard, bumpy seventy-mile journey from Narok, where the road ends. The aeroplane has changed all that. An hour's pleasant flight from Nairobi brought us comfortably to rest beside a tributary of the Mara river.

First we flew over the Mau, that range of mountains forming the south-western wall of the Rift Valley. Covered with forests of cedars and olives and, higher up, of bamboos, the

21:Huxley Q, T-5 (no date) 1960 FL11 Luo
Masai FL12

133 Mau is the source of all the rivers watering the western half
[137] of Masailand, Kipsigis and part of the Rift Valley. The birthplace of innumerable streams, it is, in theory, protected by its status as a forest reserve.

185 Looking out from the small yellow aircraft expertly handled
311 by June Wright, one of the best commercial pilots in East Africa, one could quickly see how different theory was from practice, here as elsewhere. In a forest reserve no one is allowed to fell trees, cultivate, start fires or graze livestock. In less than half an hour, I counted seventeen active fires and saw the shambles created by innumerable others. Whole ridgebacks of the mountain, sticking up like black spines, were as bare as slag-heaps and already runnelled and creased by gully erosion. Older fires were still smoking in some of these devastated areas; one could see the forest being eaten into like a great fur pelt attacked by moths.

As sure as fate, one day there will be no more water for cattle in the streams below. 'God is punishing us,' will say the Masai: but it will not be God, it will be themselves. The
[233] streams are already shrinking and the Masai are driving their herds farther into the hills to find grazing. They cannot take cattle into forest and so they burn a way in. They are creeping upwards, spreading destruction as they go in order to escape the consequences of destruction they have already caused.

[222] Other fires are started by honey-hunters who burn down trees to smoke out the bees. Often, in the forest, you can see blackened hollow cedars and olives killed by fires tucked into the roots. If the foliage is dry and the wind right, the fire will spread and get out of hand.

563 And then there are 'acceptees': a clumsy term given to men of other tribes who are settling in Masailand, family by family, with the permission of Masai elders. They are tenants: but it is very unlikely that they will ever go.

[167] In South Nyanza and in Kipsigis it is reckoned that upwards of two thousand families a year are crossing the southern border into Masailand and Tanganyika. In recent years a
[582] good many Masai have married Kikuyu or Kamba wives
[842] because so many of their own women are sterile; at one time there was quite a trade in Kikuyu girl-children, exchanged for
Cattle.

lost to the Masai as a watering place. Situated at an altitude of 4,000 feet it is flanked on the east by the Kikuyu Escarpment, and on the north-west by Mount Suswa. Water is not procurable during the dry season, but the area is used by the Masai during the rains when most of the available water then runs to waste. 133

The country between the Kedong Valley and the Uaso Nyiro at Van de Weyer's Drift, is cut up by deep escarpments and studded with ironstone hills, intersected by jagged edged dongas, all of a volcanic nature. The soil is, for the most part, a sandy orange dust. The hill sides are covered with rough thorn bushes and mimosa amongst which a considerable amount of good grass is apparent. The area is practically waterless at most times of the year, but the appearance of watercourses indicates the presence of large bodies of surface water during the rains. [134] [137]

Near the Uaso Nyiro lies the country known as Mosiro, level grass country, which affords permanent grazing for large herds of cattle all the year round on account of the proximity of the river and the consequent regular water supply.

To the east lies the country known as L'Odo Kilani, which is the northern extremity of the barren country round Lake Magadi.

The Uaso Nyiro, which is taken as the dividing line between the eastern and central portions of the Masai Reserve for the purposes of geographical description, flows into a swamp to the north of Lake Natron, which contains the lowest part of the reserve, being no more than 2,027 feet above sea level. The valley is fairly healthy in dry weather, but in the rainy season the inhabitants move westwards to the summit of the escarpment, which rises in a series of abrupt and rocky ridges on the right bank of the river from the Anglo-German boundary as far north as the Narosura River. The central portion.

West of this escarpment stand the Loita Hills, rugged masses extending over a wide area of country, watered by frequent streams, and of an altitude generally greater than 7,000 feet. These hills form the watershed of the tributaries of the Mara River, the chief of which in these parts is the Olkeju l'Ongaianet, which follows a course nearly parallel to the boundary and which enters the Mara River as it crosses the border. The Loita Hills present good grazing grounds, well supplied with water and grass, but they are too mountainous and rocky in places to be utilised to their full capacity.

North of the Narosura, and before reaching the Loita Plains, the Narosura Plains present grazing areas of the first quality, whose undulating slopes carry heavy crops of grass and are much frequented by Masai cattle. Permanent water is obtainable at regular intervals from the small tributaries of the Narosura.

The Loita Plains are entered at the Engare Ento and, though there is a deficiency of permanent water in this part, the grazing is otherwise good. The extensive areas comprised in the north-eastern portion of the Loita Plains consists of very open and bleak country, swept by cold winds, which send the temperature at night down to well below 40° F. and carrying a short close grass, which is more suitable for sheep than for cattle. The eastern boundary of the Plains is the Uaso Nyiro, which has not at this time entered into its deep ravine. At Van de Weyer's Drift the river is some twenty yards wide, running with a strong current between fairly high banks and of a depth varying at different seasons of the year, but rarely less than two or three feet deep at the drift. North of Narok Station the heights of the Mau rise through thick bush and forest country, well watered, but practically unusable for stock, to the top of the range and it is through this country that the Uaso Nyiro, with its tributaries, fall until they unite near the drift. [132]

West of the Narok lies the main portion of the Loita Plains, a vast area of open grass country, level, or slightly undulating, intersected with small watercourses, which hold water in the deeper cavities and in the neighbourhood of occasional springs at most seasons of the year, and dotted at intervals with copses of bush and scattered clumps of mimosa, a country which possesses magnificent possibilities as a grazing area if a few engineering projects are undertaken to

M
184 between the married and the unmarried people, very little work being expected of the latter, and the sweetheart system being preserved. They all, however, occupy the same village,
262 and of course the young men cannot afford to live on meat,
184 though they always come in for the lion's share when any of it is going. When parties go off on war-raids, they also contrive to eat a bullock by way of getting up their courage.

578 They lead upon the whole a very miserable life, ever threatened with destruction by the Masai, who have swept off several villages and all their cattle. The soil being the
132 very richest loam, brought down from the mountains and
134 spread over a comparatively level plain to the south of the lake, it is capable of producing anything; only the extreme dryness of the air and the very small annual rainfall, confined to a couple of months, keeps it sterile and barren.
312 To ameliorate this unhappy condition of things the Wa-kwafi have developed a wonderfully ingenious system of irrigation by artificial canals of (for them) great magnitude. They construct dams across the deep channel of the Guaso Tigirish and thus raise the level of the water to that of the plain, and then, by an intricate network of channels, they spread
262 the precious fluid over a large area, and raise their millet
241 and melons. These products form almost their sole food, eked out by what they are able to kill in the chase and by fish from the river, though when meat is scarce they are not
136 disdainful even of rats. Of these there were simply
123 myriads. They swarmed everywhere, and nothing was too sacred for them. Need it be wondered if "oft in the stilly night" were heard imprecations loud and deep upon the wretched pests when I have been wakened up by my nose being bitten or the sanctity of my toe invaded. My books were devoured, and even the bullets in my cartridges were not too indigestible. Everything, indeed, had to be kept under iron or hung up under sheds as represented on page 313.

157 As in the case of the Wa-taveta, the Wa-njemps are singularly honest and reliable, so much so that valuable
123 goods and equally valuable food are left in their charge with the utmost confidence, and I have heard of no case of this being violated. To me, one of the most remarkable features in the character of the young women and girls was their absolute unconsciousness of fear in my presence, and the complete confidence they seemed to have in me. They indeed took

134

Of the 15 edible earths analysed (Appendix I, Table V), 13 were definitely richer in sodium than ordinary Kenya soils. The sodium content of these 13 earths ranges from 0·24 to 30·15 per cent. Five of these samples were from the Masai Reserve, and four of them contain high percentages of sodium. The best of these with 30·15 per cent. would form a fair substitute for Magadi soda. In the samples from the Kikuyu Reserve, the highest sodium content is 6·35 per cent.

With regard to the other inorganic constituents, only one of the 13 samples was richer in phosphorus than ordinary Kenya soil. Five of the earths are definitely richer in calcium than soil, ranging from 0·77 to 2·56 per cent. as compared with 0·75 per cent. in soil. Two of these are from an area in the Kikuyu Reserve, and it is interesting to find that they are the most sought after. The source of supply of one of them, viz., Gitirikani earth, which has a calcium content of 1·38 per cent., was at one time in the Masai country. The Kikuyu were then in the habit of making raids and fighting for this salt. They state that their cattle were fatter, bred better, and were more resistant to disease when they had a supply of Gitirikani earth. Similarly in the Masai reserve, the most popular earth is said to be that from Ol Donyorasha, and it has the highest calcium content.

K
[721]

The two edible earths which were not richer in sodium than ordinary soil contained large percentages of iron. These seem particularly popular with pregnant women. On the whole, it is probably true to say that popularity is associated with either a high content in calcium and sodium, or a high iron content.

Ka
M
K
146
312

In addition to plant ash and edible earths, the water from certain springs is held in high esteem, especially by the women, and is used in cooking. Analyses of 15 samples show a fairly high calcium content in some as compared with different waters in Britain (Appendix I, Table VIII), the highest figure being 43·60 parts per 100,000, and the average 9·83.

*133 plateau surrounded by peaks. It is 12 to 15 miles across, roughly 2,000 feet deep, and the floor covers about 120 square miles. Willis (1936) considered it a small rift valley, blocked at the ends. James (op.cit.) considers Ngorongoro and the nearby craters of Embagai and Olomoti to be due to cauldron subsidence on a ring fault, with some subsequent in-filling by lake beds. The Highlands are composed of Tertiary volcanic rocks.

In the Rift just north-east of the Ngorongoro Highlands is Mount Lengai, East Africa's only active volcano (Fig. 9). Its conical peak rises to an elevation of 9,443 feet. The volcano occasionally smokes, and periodically it becomes active spewing out large quantities of dust and ashes. Periods of activity may cover several months or longer, the longest continuing from 1913 through 1915 (Guest, 1951). There have been about ten such periods since 1880, or an average of about once each eight years (Guest, op.cit.; Pearsall, 1957). However, since these periods have involved 15 different years, volcanic activity has occurred on an average of one year out of each five and a half during the past 81 years.

The Serengeti Plain is considered to be an [134] ancient lake bed. It is largely underlain by rocks of

[TEXT CONTINUED ON PAGE 54]

#133 134 the Basement Complex, ancient metamorphosed and granitized sedimentary rocks with minor igneous intrusions, all of the Archaean age. Basement Complex is derived largely from shales, sandstones and calcareous sediments. Overlaying these rocks are deep deposits of limestones and volcanic ashes, some of which are exposed at Olduvai Gorge (Fig. 10 and 11) where Dr. Leakey has made his famous paleontological discoveries (Cole, 1954; Leakey, 1933).

The surface deposits are calcareous tuff in the east. In the northwestern part of the plains the Basement Complex gives way to granites, which project through in the form of scattered inselbergs or "kopjes." (Fig. 12). Similar kopjes in the eastern plains are of gneiss (Fig. 13).

#133 Much of the northern part of the study area is also underlain by Basement Complex. In the Kenya Mara, a number of separated hills, their summits reaching around 7,000 feet elevation, represent remnants of an end-Cretaceous peneplain. A sub Miocene peneplain underlies parts of the Kenya area, extending discontinuously from the Siria Escarpment eastward through the Loita Hills. This surface is exposed in places, especially on the Siria Escarpment, but farther east it is often

[TEXT CONTINUED ON PAGE 591

*133 overlain by Tertiary volcanics.

*133
134 The area near the lower Mara River, leading toward Lake Victoria, is volcanic. Much of the rest of the region south of the Kenya border is granitic, or a mixture of granite, Basement Complex, and quartzites and related rocks of the Ikorongo Series (Bukoba System). Quartizite capped hills and ridges are characteristic of the country from north of the Kenya border south toward the Serengeti Plain, and west to Lake Victoria. These are interspersed with occasional hills capped with Bukoba sandstone or granite, and characteristic granite inselbergs. These similar appearing kopjes are also found occasionally throughout the entire study area.

The area immediately north-west of the Serengeti Plain has a complicated geology. Gold bearing quartz reefs occur in this area, and as a consequence it is particularly well studied geologically (Stockley, 1935; 1936).

Soils

*126
134 Methods: We collected soil samples from most sites of vegetation plots, particularly where it was desireable to examine possible correlations between soils and vegetation, fire, and grazing. We dug over

*126 100 soil pits in the region of the Serengeti Plain, and
• 134 collected some material from other areas. The method was as follows: We first dug a pit, about one by two feet or larger, and deep enough to get through the top soil horizon. We then took a soil auger and with it dug a hole a minimum of six feet deep, wherever possible. In some areas rock or particularly hard caliche enforced a shallow pit. In a few cases we took advantage of pits or soft earth and dug down ten or more feet deep. The soil from each auger-full was knocked out in turn along a line to form a long pile with the last auger-full at one end and the first at the other. Samples were then collected from each horizon. A description was written, and the location plotted on our map. The samples were sent to the Scott Agricultural Laboratories in Nairobi, who kindly analysed them for us. The following discussion is a brief generalized description of the soils of the study area. Detailed results of the soil analyses will be presented where appropriate later in the text.

134 General Description:

/The soils of the Mau and Ngorongoro Highlands are brown or red ... rich, silty loams derived from volcanic ash. These are underlain by clay or clay loam which is often exposed by erosion. Under forest conditions the humus content of the top soil is high, but erosion is relatively swift when the vegetation is

134 cleared by fire, cutting, or grazing.

The eastern Serengeti Plain has a soil derived from, and often largely composed of, calcareous tuff. It is a medium to fine-grained grey-brown tuff which covers the whole of the eastern plains and many of the surrounding hill tops. The Salai Plain and adjacent parts of the Serengeti Plain are covered by dunes of black volcanic ash. The ash comes from the periodic volcanic activity of Lengai volcano which is immediately to the southeast. Southeast winds prevail most of the year, and although the dunes are mostly stabilized by vegetation (Fig. 14), the influence of the winds can be clearly seen in their form and orientation. At several points in the eastern Serengeti there are small shifting dunes, famous in East Africa as the "Shifting Sands." These are actually small unstabilized barchans formed of the same black ash. In periods of volcanic activity considerable quantities of this ash are deposited over the plains. Residents of Tanganyika told us of travelling through the central plains immediately after an eruption and of finding ash covering everything in deposits up to two feet thick at distances of over 40 miles from the volcano. These eastern soils are immature, often undifferentiated to a considerable depth. The texture is very loose. Except where

*133 134 *[132] 134

[TEXT CONTINUED ON PAGE 63]

134 stabilized by a good vegetation cover, the soil surface and the organic matter are frequently in motion, being blown westward. These soils are quite rich in soluble minerals but very low in nitrogen, especially where vegetation cover is lacking. They often have a shallow underlying hardpan (Fig. 15).

In the west of the Serengeti Plain the loose ash grades into gray and black sedimentary soils. In the lower, less well drained areas these soils are heavy calcareous black or gray clays, the [illegible] "Black Cotton" clay of East Africa. Underlying these surface loams or clays is often a red clay, and to the north and west of the Serengeti Plain, except in the valley bottoms, the predominant surface soils are red earths. Heavy black loam or clays are found in the valley bottoms, especially in the valleys of the Grumeti and Mbalangeti Rivers. There is a clearly defined catena structure on the slopes of the western hills, extending from the exposed rocks on the ridge tops through the red earth slopes to the dark sedimentary soils in the bottoms.

North to the Kenya border the red earths predominate, with black heavy sediments in the bottoms and catena structures similar to those of the western

[TEXT CONTINUED ON PAGE 65]

134 area. The valley of the Mara river in Tanganyika has soils derived from volcanic material. In the Kenya Mara the progression of soil types from west to east is similar to that in the Serengeti. In the Mara Plains the bottoms are typically heavy gray or black loam or clay. This grades to red soils on the surrounding hills, and to a light, calcareous soil derived from volcanic ash on the Loita Plain in the east.

Climate

#114 #126 #132 Because of the isolation of the area and the low human population, climatic data from Western Masailand are very sketchy. However, there are some data from records of the East African Meteorological Department at Nairobi, the District Administration at Narok, and the Serengeti National Park. The following discussion is based on these records and our own observations.

#132 Western Masailand lies within the Tropical Savanna (Aw) Climate. Local factors influencing the weather in this area include the mountain masses bordering the area to the north and south, Lake Victoria to the west, and the arid Rift to the east (Fig. 3).

19: Talbot K-4,5 (1956-1962)1964 FL12 Masai FL12

Figure 16.

Isolated rain storms in Ngorongoro Crater. This rainfall is typical of the dry season precipitation in Western Masailand. The shower on the left is mostly evaporated before it reaches the ground. The storm on the right is torrential causing heavy run-off. Both are very localized and the ground around them remains dry. The light colored deposits are alkali from the dry lake bed in Ngorongoro.

[134]

*132 Outside of the peak rainfall, most precipitation comes in the form of torrential storms or brief, light showers. The maximum amount of rain recorded in any 24 hour period in the study area is only 3.5 inches, but many storms only last a few minutes. The rainfall may be so heavy in these scattered storms that where they pass over areas without a high vegetation cover, the splash creates a ground-obscuring mist two to three feet high. We measured up to 0.45 inches of precipitation from such storms, which often lasted less than a half hour.

[134] There is very heavy run-off following such storms and unless there is a good vegetation cover the combination of the splash impact and the run-off causes considerable erosion.

The light showers frequently do not even reach the ground, and when they do they often have relatively little effect. The ground surface is hot and a desiccating wind usually blows day and night. Much of the precipitation that reaches the ground from light showers is evaporated almost before the cloud passes on.

During the peak of the rains the daily precipitation is somewhat higher than the yearly average (Table 4). Due to the more general overcast there is less evaporation

[TEXT CONTINUED ON PAGE 74]

*132 below the general overcast. We watched it at a range of about 10 miles for about 15 minutes, before it passed out of sight. Small "dust devils" were common on any hot, windy day, but this was the only large scale cyclonic column of this sort that we saw. Roosevelt (1910) referred to seeing "a waterspout or cyclone" one stormy evening near Mt. Kenya. This is the only other reference we have found to this phenomena.

<u>Summary</u>: Western Masailand lies within the Tropical Savanna (Aw) Climate, and local weather influences include the Lake Victoria on the west, mountain masses in the north and south, and the arid Rift Valley on the east. Average annual rainfall follows a gradient from about 40 inches near Lake Victoria to about 20 near the Rift. Some rain may fall in any month, but the most rainy period is November through May, with peaks in March and April. Rainfall is very irregular in occurrence and distribution; two years out of three expect below average rainfall, and one year out of four expects less
• [134] than 20 inches. Most rain falls in the form of short torrential storms or showers, hence much of the rainfall may be lost to the vegetation and underground water supplies through immediate erosive run-off or evaporation. Potential evaporation appears to exceed

19: Talbot K-4,5 (1956-1962)1964 FL12 Masai FL12

*137 Trampling

Trampling can be a factor in killing some perennial bunch grasses, while annuals and perennials such as Panicum are quite resistent to it.

* 134 Where domestic livestock are herded back and forth along the same routes the hooves cut through the turf and cause some erosion (Fig. 68). In areas of loose soil, especially in the eastern plains of the study area, this factor is quite serious.

*13 Wild animals also create trails. During the seasonal migrations long lines of zebras and wildebeests follow one another nose to tail and the resultant trails are quite conspicuous (Fig. 73). Since these trails normally are only used once each season the erosion effect is minimized. Where migratory movements are compressed into saddles between hills or narrow valleys these trails are worn very deep and have become a characteristic physical feature of the country.

*[233] Domestic livestock are closely herded in tight bunches (Fig. 24 and 25) which accentuates trampling damage. The wild animals graze in open formation. Even large herds of wildebeests are relatively openly spaced (Fig. 74) which reduces trampling damage, even from very large numbers of animals.

*137
*[136] by tsetse fly -- so must have been relatively open.

[101]
[231]
*[233]

1850-1890: This appears to have been a period of increased burning, expansion of the Masai into the lands north of the Serengeti up to the Mara Plains, and increasing numbers of livestock. The open grasslands reached their greatest extent during this period, and the area between the Serengeti Plain and the Mara became open grassland with riverine forest and scattered thickets, much like the present southern Mara Plains (Fig. 79a).

*134
*137
[101]

The Masai apparently extended their grazing and particularly burning far up into the Mau Escarpment. Spectacular erosion can be seen over much of the Mau Escarpment north and east of the Loita Plain. Virtually no top soil can be seen over hundreds of square miles at the lower elevations, and where some does remain it may be 10 to 14 feet above the present ground level, on top of a pedestal of earth held against erosion by the roots of a few surviving cedar trees. Trees growing in the bottom of these erosion scars in 1960 were dated as being 50 to 80 years old which would put the period of recovery in the late 1800's at or after
[101] the disasters of the Masai. During the period of dry years culminating in 1961 the Masai extended their

•134 *137 (101) burning and grazing far up into the same area of the forest, and the torrential rains that followed the dry period in 1961 created new erosion scars of as great magnitude as those of the earlier period.

*13 *233 [731] At the peak of the power of the Masai in the 1880's they had very large numbers of livestock. Their peak of intensity of livestock grazing, and probably overgrazing, came at the onset of the droughts which culminated in the famine of 1890. Conditions may have been much the same as in 1961. The effect of grazing animals on the vegetation, as well as the impact of fires where there was fuel, probably reached a peak about 1890. It is probable that a brush invasion through overgrazing was already starting in some of the open grassland.

[101] 1890-1918: The result of the combination of disasters that struck the Masai in the 1890's was that they largely vacated the Serengeti Plain and the country to the north all the way to the Loita Plain. There was a period of about 15 years of very much reduced grazing by domestic livestock and apparently reduced grass burning, and for part of this period there was probably almost no regular grazing or burning. This was

233 The far greater part of the steppes offers excellent pasture; only
311 smaller or larger isolated stretches are quite unsuitable for this. The
[823] Masai know these precisely and scrupulously avoid them. What makes
them unusable is first of all the occurrence of grasses that bring about
digestive disorders and the lack of salt in sufficient quantities, through
which a similar effect is brought about. In good pasturing places one
[135] always finds salt licks. The rain water standing in a depression in the
ground has leached out the very saliferous earth and, after evaporation,
[825] has left behind a more or less strong, gray crust of salt. It is self-
evident that one avoids those places about which the presence of the
above-mentioned harmful insects is known. It is striking, however,
that ticks are not feared at all.

361 When the pasture around the kraal has been grazed off, a change
233 of dwelling is decided upon, which takes place as soon as a new
pasture ground has been found by a few people sent out. Then there
is activity in the kraal long before daybreak. After the cows have
been milked, the cattle moves off as the first party. Then the herds
of goats and sheep follows, and after these /177/ the calves. Young

1: Hollis G-5 (ca. 1894-1904) 1905
FL12 Masai FL12

The boy then asked them: 'Don't you believe these cattle are Sae-Kidongoi's?' 539*

The lions were incredulous, and told him to show them the devil. The boy replied: 'He is asleep.' But he went to where a calf was lying, and tied one end of the devil's tail to it. The tail was so long that when one stood at the other end it was impossible to see that it had been fastened to the calf. The boy then returned to the lions and called them. One of them went with him, but when he saw Sae-Kidongoi's tail he fled and the others flollowed him.

The next morning the boy followed the cattle trail until he reached his father's kraal. He made his own kraal, and then went and killed his father and step-mother, after which he combined and kept the two herds.

Both he and his sister became adults, when certain ceremonies were performed. They then married and lived happily ever afterwards.

[136] [1] The bird which the Sipolio wear round their heads is the mouse bird (*Colius affinis*, Shelley). Boys who behaved in a cowardly manner during the operation are not allowed to shoot these birds.

[2] This word is commonly but incorrectly written Elmoran.

by numerous tributaries, which run in deep valleys from the heights of the Mau. Chief among these are the streams known as Narok, Siyabei, Pusi Lukunyi, Olodari, Penyin and Sosian. At latitude 1° 30′ south, the Uaso Nyiro enters a deep gorge and flows sluggishly through swamps and tall grass from that point to Lake Natron, flanked throughout by the Nguruman Escarpment on its right bank. Eight miles from its mouth, it becomes lost in a swamp, but its course is sometimes visible as far as the lake. 133

The Mara River also rises on the Mau, whence it cataracts down in a south-westerly direction until, a few miles below the Mara Bridge, it too becomes sluggish. After crossing the Anglo-German boundary, this river proceeds due west until it reaches the Victoria Nyanza, seventy miles away.

Other less important rivers are the Gori River, in the trans-Mara country, which rises from Gelegele Hill, and finally flows into the Kuja near Karungu Bay, the temporary river Kikalelwa flowing eastwards from Kilimanjaro and the Namanga flowing from Mount Orok.

Lakes.

There are no permanent lakes of water of any size within the reserve. Perhaps the most interesting feature of the country is found in the soda lake at Magadi, whose deposits are now forming the object of commercial enterprise. Lake Amboseli is a flood of water in the wet season, but dries up during dry weather.

The Rift Valley.

The Rift Valley, which marks the termination of the lava plains of Kaputiei and Athi on the east, crosses the Masai Reserve from north to south from the Kedong Valley to Lake Natron. This valley, the Erythrean or Great Rift Valley, extends through East Africa from the German frontier to Abyssinia, and thence to the Jordon Valley. "This valley," writes Professor Gregory, "has been formed by the subsidence of the block of material that once filled it. At one time, the surface of the volcanic plains to the east of the Rift Valley were continuous with the similar plains to the west. Parallel cracks, hundreds of miles in length, broke across the rocks: the block of material between these cracks sank, leaving walls, in places, so precipitous that the Uganda Railway has had temporarily to use a cable-worked funicular railway for the descent into the valley from the Kikuyu plateau. The walls of the valley, however, are not always precipitous. The lines along which the subsidence occurred cut across ridges, valleys, and basins: and the character of the scarps that now bound the valley varies with the structure of the country on either side of the Rift Valley."*

Eastern portion.

Dealing more particularly with the geographical divisions into which the reserve is divisible, the eastern portion of the reserve consists initially of an open plain, known as the Nyiri Desert, situated to the west of the Chyulu Hills. This so-called desert is at an altitude of about 4,000 feet, and is covered with bush of a varying density. There is no surface water in it, but the bed of a stream, known as the Sand River, crosses it from west to east, a bed averaging two to three hundred yards broad, from which water can be obtained by digging. One branch of this underground watercourse appears to be the continuation of the Kajiado River.

Further to the south, and at about the same altitude, lies the sometimes swampy country at the foot of Kilimanjaro. This plain consists of muddy sand, impregnated with various salts, which renders difficult the growth of any vegetation. Here and there a few sheets of water are to be found in the wet weather, surrounded by rings of grass, while considerable areas are covered with the white crust of soda and saltpetre. No rivers run from Kilimanjaro on its northern face, and the small streamlets which are occasionally running from the snow line do not proceed further than this plain.

Perhaps the most remarkable feature of the Nyiri Desert and the plains to the south is the quantity of game which exists in those areas, and it must be remembered, in this connection, that that country forms part of the Southern Game Reserve. [136]

Further to the west, the ground falls slightly to an altitude of under 3,000 feet at Lake Amboseli, and then rises to Mount Orok. From this mountain rise

In March, 1913, no specimens of tsetse fly had been received from the Southern Masai Reserve Extension, but reports had come in that the Masai moved their stock during portions of the year from certain restricted areas where fly was rumoured to exist.

*648 23 136

Mr. Anderson's visit.

In response to a request from the Secretary of State for further information on the subject, Mr. Anderson, the Government entomologist, toured parts of the reserve during the months of April and May, 1913. His report dealt severally with the different parts of the region examined.

I.—The Uaso Nyiro Valley.

A low swampy tract of country, from one to three miles wide and covered with dense bush and tall, coarse, rank grass, lies on the western side of the Uaso Nyiro between the river and a high escarpment. Both *Glossina pallipedes* and *Glossina longipennis* were found all over this region.

Glossina pallipedes was not confined to the banks of the river but was distributed over the whole area, and specimens were taken at all hours of the day.

Glossina longipennis was found to be fairly common on the moist swampy flats and on the banks of the river and was very active in the region.

II.—From the Uaso Nyiro to the Mara River.

Both species of tsetse fly were taken on the slopes of the escarpment and for six or seven miles in a westerly direction from its summit. *Glossina pallipedes* was found at an elevation of nearly 4,000 feet above sea level. No fly was found in the Lengutoto, Morijo, Rotuaik, Sianna and Southern Osero regions.

III.—The Valley of the Mara River.

Unfavourable weather conditions hindered investigations in this neighbourhood and no tsetse fly were found.

IV.—The Magor or Gori River.

No trace of fly was found in the small portion of the Gori Valley which was examined and the presence of large numbers of cattle and donkeys indicated that the valley was free from fly.

V.—From the Mara River to Naivasha.

No fly areas were discovered in this region.

Mr. Woosnam's investigations on the Mara River.

Mr. R. B. Woosnam, who accompanied Sir Henry Belfield on his tour in the Masai Reserve in June, 1913, spent several days investigating the presence of tsetse fly in the Mara River Valley. Only one specimen of *Glossina* was encountered during his visit but from observations made and from reports of the Masai inhabitants he deduced that a species of *Glossina* existed on the Mara River below the bridge, mainly on the western bank to an altitude of 5,200 feet above sea level. He did not consider the presence of this fly to be of much importance, as natives with their cattle had been living for many years in close proximity to the fly area without any serious loss of stock.

The Ol-Orokuti Area.

The Ol-Orokuti country is fairly free from fly, but one or two places are known to be infested, notably in the valley of the Osinaridei stream, on the Lower Magor, Kaiyan (Oyani) and Engare Rongai Rivers.

Postponement of further investigations.

Mr. Anderson's reports were forwarded to the Secretary of State who replied that, while Mr. Anderson had covered much of the ground, a considerable amount of investigation was still required as to the prevalence of tsetse fly in the reserve, and requested that arrangements be made for a further investigation of the region at the first suitable opportunity. Mr. Anderson represented that owing to climatic conditions July was the most favourable month for renewing his inspection, and his subsequent tour was accordingly fixed for July, 1914. During that month, however, he was engaged on other important investigations at Kabete, and his tour was indefinitely postponed in August, 1914, owing to the outbreak of war.

FL12 Masai FL12.
Wa-Kwafi

M 184 between the married and the unmarried people, very little work being expected of the latter, and the sweetheart system being preserved. They all, however, occupy the same village, 262 and of course the young men cannot afford to live on meat, 184 though they always come in for the lion's share when any of it is going. When parties go off on war-raids, they also contrive to eat a bullock by way of getting up their courage.

578 They lead upon the whole a very miserable life, ever threatened with destruction by the Masai, who have swept off several villages and all their cattle. 132 The soil being the very richest loam, brought down from the mountains and 134 spread over a comparatively level plain to the south of the lake, it is capable of producing anything; only the extreme dryness of the air and the very small annual rainfall, confined to a couple of months, keeps it sterile and barren. 312 To ameliorate this unhappy condition of things the Wa-kwafi have developed a wonderfully ingenious system of irrigation by artificial canals of (for them) great magnitude. They construct dams across the deep channel of the Guaso Tigirish and thus raise the level of the water to that of the plain, and then, by an intricate network of channels, they spread 262 the precious fluid over a large area, and raise their millet 241 and melons. These products form almost their sole food, eked out by what they are able to kill in the chase and by fish from the river, though when meat is scarce they are not 136 disdainful even of rats. Of these there were simply 123 myriads. They swarmed everywhere, and nothing was too sacred for them. Need it be wondered if "oft in the stilly night" were heard imprecations loud and deep upon the wretched pests when I have been wakened up by my nose being bitten or the sanctity of my toe invaded. My books were devoured, and even the bullets in my cartridges were not too indigestible. Everything, indeed, had to be kept under iron or hung up under sheds as represented on page 313.

157 As in the case of the Wa-taveta, the Wa-njemps are singularly honest and reliable, so much so that valuable 123 goods and equally valuable food are left in their charge with the utmost confidence, and I have heard of no case of this being violated. To me, one of the most remarkable features in the character of the young women and girls was their absolute unconsciousness of fear in my presence, and the complete confidence they seemed to have in me. They indeed took

6: Thomson K-3 (1883-1884) 1887
FL12 Masai FL12
Wa-kwafi

123 days before they seemed to grasp the uses of the mirror, but
157 their feminine instincts soon told them, and they would frequently get it to see that their ornaments were properly arranged. A few photographs of some of their charming white sisters which I happened to have with me were a great source of delight. They actually supposed them to be living beings, and if told that they were asleep, they were quite satisfied.

123 In the midst of these unsophisticated people, and pleasing incidents which I delight to recall, several days rapidly
136 passed. My experiences were further varied by some shooting trips, in one of which I was so fortunate as to secure two beisa antelopes (*Oryx beisa*), the first I had seen. I also saw for the first time the lesser kudu. The waterbuck were in great numbers about the lake to which I paid a visit.

000 Before my arrival at Baringo my friend Jumba Kimameta had proceeded to the country of Engobot, about 120 miles N.N.W., but had left several old men with large quantities of food, donkeys, &c., pending his return south. He had also left a goodnatured old fool to go with me, but as he knew no more than myself of the country I now wanted to traverse I could not see the use of him.

And now the final stage, the most uncertain of the whole journey, had to be attempted with the agreeable knowledge that the last three caravans which had preceded me had each lost more than one hundred men by violence. One of these disasters had occurred only the previous year, and yet I now proposed to go into the same country with only one hundred men all told. As in the case of my Lykipia trip, the traders swore it was impossible, and that I would never get back alive. My own men, however, had come to know me by this time, and there was not a remonstrance from one of them. Sadi, though greatly against it, rose considerably in my opinion by stating that he was ready to follow me. Not so Muhinna. He, knowing now the futility of tears and entreaties, took a new line, and feigned extreme illness, groaned mightily as if with racking pain, and if he came to the door did so only with the aid of a stick, his body bent over it, sighing deeply, and in general looking the very picture of woe. I knew it was all a sham, but so thoroughly did I detest him from the bottom of my soul, and so much was I afraid that in the event of my taking him he would play me some ruinous trick, that I pretended to

/34 cont./

262 Masai only most reluctantly and infrequently sell cow's milk, for
272 the buyer indeed could in the above-mentioned manner make their cows sick with it. The Masai scorn any kind of game meat, as
[136] well as birds and even fish, of the latter of which species of Barbus, Chromis, Clarias, and the sheatfish-like Synodontis occur almost everywhere in larger brooks.

252 The preparation of the principal vegetables is the following:
262 batatas (ol muruṅgu, el muruṅguni -- Ipomoea batatas) are cooked
263 in water with a little steppe salt (e munján), then drained, mashed with a whisk (ol gibere, el giberen), and stirred with fresh milk. The finished dish is called el muruṅguni. Unripe bananas (ol marigol, el marigo -- Musa paradisiaca) are peeled, cut up, and cooked in water with salt. After they have been drained, a little butter (eṅ gorno) is added. Unripe dried bananas (ol kitáuo, el kitáuón) are cooked in water, drained, and then stirred with milk and butter. Maize kernels (ol bálegi, el báleg) are cooked in water without the addition of salt. Beans are cooked with salt. One distinguishes ol bombol -- el bombo (Dolichos lablab), eṅ giú --eṅ giún (with which both Cajanus indicus and Vigna sinensis are designated), furthermore os sigoriol -- es sigorio (Phaseolus vulgaris), ol gámuri -- el gámuri (Phaseolus radiatus). Eleusine coracana (en dabá -- 'n dabán, or en drigá -- 'n drigán or also called eṅ guruma -- 'n guruman) and Sorghum vulgare (ol birirí -- el biririn) are cooked to a thick porridge and lightly salted. Dioscorea abessynica (ol geré -- el gerén) and Colocasia antiquorum (which the Masai on Kilimandscharo designate with the Dschagga /Chagga/ word maduma) are cooked in salted water.

Honey (en aischo -- 'n aischi) is eaten unmixed and is also
276 used as an addition to various medicaments. They buy tobacco
[439] (ol gumbau, Nicotiana rustica), which the Masai consume in quantities, from sedentary Negroes, who put it on the market in loose, bast-wrapped packets (Fig. 4) of various sizes or in the shape of solid balls about five centimeters in diameter.
[415] For the preparation of this, the tobacco leaves,
→ picked ripe, are tightly packed, tied up with

Fig. 4.

/35 cont./

276 adds some natron salt and beef fat, frequently also pulverized bark of ol amóra (Ocimum suave Wild.), and mixes the whole by further grinding.

[415] Small boxes (en dulet -- 'n duleta)
[237] made out of wood, bamboo, cattle
[531] or sheep horn, or even out of the
[136] horn of the Rhinoceros bicornis, which often are quite attractively carved and decorated with beads,
[273] serve as snuffboxes (Fig. 6). They
[415] are worn around the neck on thin chains made out of iron wire.

Fig. 7. (1/10.) Vessel for the preparation of honey beer.

273 Another luxury, also intended only for married men, is a kind of honey beer (en aischo namga) (Fig. 7). One dissolves honey in
[824] water and adds a piece of the root of the steppe aloe, os sugurôl, /36/ or a peeled and cooked piece of the root of the so-called liver-sausage tree (1)

1. Named after the resemblance of the fruit to a liver sausage.

(ol darbôl -- Kigelia aethiopica), both as a taste corrective and to hasten the fermentation. The mixture is allowed to stand and ferment three to five days in a warm place, say, in the vicinity
[824] of the hearth fire. Before it is drunk, one often puts in a few bunches of leaves from the ol gonjet bush, I suspect in order to stop the vinegar fermentation. The honey beer is quite strongly intoxicating, so that a drinking bout usually ends with complete
[439] drunkenness. Other brews, which the sedentary Negroes bring to the Masai for sale and which are made out of bananas and Eleusine, maize, or sorghum, are milder. The Masai do not distinguish these with names, but rather call them generally ol márua.

[Warrior Kraal]

/90 cont./

512 before the milking is finished, then the calves are allowed to go to
[234] the cows for about an hour, and finally /91/ the former must again be separated and shut up, so that there will be enough milk in the morning. At ten o'clock it becomes quiet, the people retire into the huts, except for the boys who lie down to sleep on the ground beside the goats.

• 136 The silence lying over the vast steppe is broken only now and then by the howl of the spotted hyena (Hyaena crocuta), reminiscent of the whistle of a siren, more rarely by the hoarse laughter of the striped hyena (Hyaena striata and Hyaena Schillingsi). Sometimes
825 the roar and growl of a lion can also be heard, and if the latter slinks about silently sometime, one becomes aware of its approach

535
701

Ill. 35. Dance in the war camp IV.

825 by the behavior of the cattle: they snort, stamp, and crowd together, or race wildly through the kraal. Then a number of women immediately hasten out of the huts, in order to drive away the beast
000 of prey by shrill, trilling cries (ol gijoi). A few intrepid warriors also

/98 cont./

727 in shares as equal as possible; one warrior receives as much as the
[703] other, but before that a few head of cattle are distributed as a special reward and first to those warriors who killed an enemy in battle, then to the benefactors (ɪ̈ gaminini), then to the one who captured the first head of cattle and to the spies who went ahead (el aigedalak), and finally to the wounded, each of whom is entitled to the head of cattle that he marked with the blood gushing out of the wound. The number of cattle that the individual of the ones mentioned receives, except for the last who is entitled to only one head of cattle, is determined by the size of the booty and the proportion of the size of the booty's parts according to the above order of succession. /99/ Every
727 warrior strives as quickly as possible to drive off from the others his
579 share of the booty, but each one also tries to take along with it one or more head not belonging to him. This, of course, gives rise to another brawl, in which there are almost always several wounded men.
[614] If the booty is too small for an equal division, the warriors form two parties, on the one side the El muleljan, on the other the 'L aiser and El menganа. The former have as slaughtering cry the term ɛdo monɪ̈gi = the red cattle, the latter the term narok geteɪ̈ = the black cattle, after which they are also sometimes named (for example, I heard it in songs). A fight decides which one of the two parties receives the entire booty.

722 At home in the kraals it was very quiet during the warriors' absence. After the farewell, those remaining behind went home, each somewhat heavy-hearted in the anxiety about a son or lover, which, however, was soon more or less pushed into the background by the expectation of the spoils that they would bring back. Soon after the farewell the old man was again
[237] squatting in quiet contemplation in front of
[136] his hut and chasing away from his face and head, also as before, with a fly switch (ol enjua, el enjuai /Fig. 20/) consisting of a gnu's tail, the flies constituting a veritable
[782] plague in the Masai kraals. Then he took a hair from the switch and made a knot in it for each of his sons who had gone to war,

Fig. 20.

/103 cont./

619 After a battle of the Masai among themselves, the conclusion of
728 peace is that the speakers, in the presence of a number of warriors of both parties, exchange their skin capes and sandal thongs. This is called etabaschage megitin = exchange of skin capes.

726 The length of the stretches covered on war expeditions, in com-
701 parison to that of their neighbors carrying on agriculture, is often
484 astonishing. Performances of 60 to 80 kilometers a day, three or four days in succession, are by no means exceptions. If one considers,
[702] however, that the training of warriors consist only of marching, that,
[276] aside from their weapons, they carry nothing heavy, and before their marches, as well as during them, they partake copiously of stimulants, their performances in no way exceed those of a German infantry
701 troop. The tales of the caravan people relate miraculous things about
182 the speed and endurance of the Masai warriors, and even European
147 travelers have contributed to the spread of this legend in that they
271 compare the physical performances of the Masai with those of the Europeans in the tropics. The untenableness of such a comparison is obvious. One also often hears how the Masai are admired for their alleged ability to be able to give up the drinking of water on their marches. Presumably this rumor arose from the fact that these people, in contrast to other tribes, never carry a gourd bottle of water on their
701 long migrations. The Masai, however, knows perfectly every little
182 spot of the steppes, he knows every rocky basin, every tiny spring,
271 he also knows where an apparently dry brook bed carries subterranean
[823] water. Where water has collected in old hollow trees, and especially in baobabs, this is accessible to him through a series of steps made
[824] out of foot-long taps bored in horizontally. Finally, there are a number of water-rich roots and tubers, which, chewed, are very well suited
701 by their water content to quench thirst. They serve him, /104/ just as
182 the wild honey, not infrequent in the steppes, also serves as food on the
222 march. A cuckoo bird, the honey indicator (Cuculus indicator, called
[825] en̂ johoroi by the Masai), leads the Masai to the concealed honey holes.
[136] As soon as it sees human beings it calls with a strident sound and then flies slowly to the nearest honey place, to which the people follow it
[825] in order to take out the honey. If the amount found is still not sufficient for the warriors, they bury the chewed comb, whereupon the bird, after

/110 cont./

578 192 man. From young girls among themselves one hears: eñ orobó menje = accumbens patri /one who lies with her father/, eñ orobó 'l alabe = accumbens fratri /one who lies with her brother/.

Used by warriors toward young girls: hai em baĩlach = you, vulva; hai, e mówo = you, clitoris.

Younger children insult one another:

ñotonji eñ gomos = vagina matris;

ol agambai Eng ai = hated by 'Ng ai;

tababuá = stumble;

ol agaischiri Eng ai = cry to God (when you get a beating);

e mai = stupid fellow;

hai ol madai (or e madai) = you stupid fellow (stupid girl);

id' ol airirua, you are a blockhead;

id ol bua, you are a rowdy;

id' ol dillo endoi, that is, you are indeed mad. The term ol [136] dillo, which here means madman, is formed from the like-named bird, the red-headed Anaplectes melanotis, one of the many species of the weaver birds native to East Africa. If one en route hears it call- [777] ing on the steppe from the left side, it means good luck, but if it [825] calls to the right of the traveler the latter will soon encounter a misfortune.

Ol agatar' em baie, that is, die by an arrow, ol agawa ol golling = die of fever; ol bebedo = of the upele sickness; ol minjaloi = of smallpox; eñ gohogge = of stomach or intestinal sickness; ol agataremo el gigaret = may the thorns prick you; ol agatarigi ol mairoo = may your belly burst from eating; ol agairokiacho = become black; ol agoibarra = rogue, brawler; e at' ol marenge = slanderer, gossiper; ol duñgani serseri = bad fellow; ol duñgani guret = coward.

201 To express contempt one spits before the person concerned or at him.

192 593 The large number of invectives stands in contrast to a striking poverty in terms of endearment.

/111/ The mother designates her child as 'l aischa 'Ng ai = child given me by God, as eñ gutok e ñejo = mouth of the mother, or as ol oib e ñejo = resting place of the mother. The father calls it ara ñgotonji = child of the wife. Older brothers and sisters talk fondly to younger ones with the term ara e ñejo = child of mother.

are welded together. As this shows, the extraction of iron is very difficult work. Therefore it is still found only rarely today. For the
[437] most part one works iron wire, which everywhere in the Masai country is the favorite article of barter. Pieces of wire 15 to 25 feet long are twisted together; when they are red-hot, they are sprinkled with mall shells and then hammered together. The object ready in shape, for example, a sword blade, is smoothed and polished with volcanic slag and sharpened on a stone. The principal
326 products of the blacksmith art are spear, sword, and knife. The two parts of the spear, blade (es ilbil, ilbilin) and socket (ol ŋgorói, el ŋgorati), a blacksmith with his helpers should make in one day,

325
413

Fig. 184. (1/4)

326 sword (ol além kitok, el aléma kiwa) and ax (ol ólin, el ólina) in half a day, the other smaller objects, such as knife (ol alem), awl (ol ólol, el ólol), iron for cattle branding (ol mukiri, el mukiria), arrow points (em bunid, m bunide), razors (ol mukiyit, el mukiyita), tweezers for plucking the beard (ol budet, el budeta), in a still shorter time. As payment he receives for a spear two goats or an ox
[435] for a sword, a large livestock-bell (ol gurugur, é gurugurí); for an

/133 cont./

411 and not flattened in the center. The string is twisted from the back
[235] tendons of cattle. As a hunting trophy one often winds a couple of
[237] strips of hide from the /134/ slain animal around the bow. The
point of the arrows [Fig. 37] (em beif, m be) has the customary
"arrow shape" or is lancet-shaped or awl-like. Its tang, on either
[237] side, bears a tight row of barbs made by notching. It sticks into a
[136] wooden shaft, the lower end of which is notched and bears a three-
part, rounded feathering made from the feathers of the carrion
vulture (Neophron percnopterus), which one always sees in great

Fig. 37. [36]

/134 cont./

411 [136] [237] flocks in the branches of the trees surrounding the kraals, waiting for some kind of animal waste. In addition to the iron points, one also finds awl-shaped wooden points; the latter are often poisoned, the former only rarely. The Masai do not make the poison (en [439] duerai) themselves, but buy it from Wandorobo, who obtain it from /135/ the olmoridjoi (Acocanthera abyssinica) tree by boiling the roots and the wood. The arrows are carried in a leather quiver (e modian, modiani), which is slung over the shoulder on a leather [237] strap. It consists of a tube 70 centimeters long and made out of neat's skin, with a bottom stitched in and a similarly worked, twelve-centimeter lid that can be turned up high.

Firearms, which at times almost entirely replaced the spears and bows among sedentary Negroes (1),

1. For example, in a few areas at Kilimandscharo.

[648] [727] are not generally carried by the Masai. Although in the battles with the Protectorate Troops they have at various times captured guns and ammunition from fallen Askari, I never observed or learned that they used these weapons. They never bought muzzle-loaders from trade caravans, and the ones that I found in one of their kraals showed by the lack of cock or piston, or by other damage, that they were not carried along by the Masai for the purpose of use, but merely as trophies. It was not until April, 1902, [177] that a troop of Masai warriors armed with English Snyder breech-loaders came into my field of observation. The troop came from the Masai province of Ol bruggo, and, to be sure, from the English station of Nairobi, located on the Uganda railway, and attempted an invasion in the Kilimandscharo area of Rombo. With a loss of approximately 20 per cent dead and bootyless, however, they were sent home by the Warombo, armed only with spears.

/136 cont./

281 The other skins, after they have been well dried and /137/ dehaired
by scraping with a sharp ax, are treated by a vigorous rubbing with
[824] a tanning extract. The bark of Terminalia Brownii Fresen var.
Merkeri Engl. (ol bugoi) is pounded and made into an extract by
being boiled in water. The finished leather is soft and pliable.
[462] Leather dressing is women's work. The scraped-off cattle hair is
carefully hidden in the thorn fence of the kraal, so that the cattle
do not eat it and become sick from it.

291 The sole article of clothing of the warriors is the skin cape
[294] (e megiti, megitin); it consists of calf skins sewed together into a
strip approximately 110 centimeters long and 64 centimeters wide.
The entire strip of skin is folded over once crosswise, and of its four
corners the two top ones, lying one on the other, are sewed or tied
together. One puts the cape on by sticking the head and left arm
through; the knot lies on the right shoulder, chest, back, and left
hip are covered, left shoulder and right hip bare; the latter so that
[294] the sword found there is free. The warrior cape is the only article
of clothing that is never dishaired. The hair side is worn on the
outside and, if carefully chosen in color,
is often quite attractive, since only the
silky-lustrous skin of claves unborn or a
[294] day or two old are used. Often the upper
and lower edges of the cape are sewed
with one or two rows of small red or white
• [136] beads. Only very rarely is it also made
of other skin; thus, the author saw two
made out of that of the dark-green long-
tailed monkey(Cercopithecus albigularis).
Boys and men wear tied over the seat to
the sword belt a three-cornered piece of
leather to sit on (Fig. 38) (ol gebesse,
el gebesseni), made of neat's hide or
calfskin, for protection when sitting,
against the thorns and prickly spikes of
the grasses scattered everywhere in the steppe. Boys wear a very
short cape (en jergog, n jergogi), covering only the belly and back;

Ill. 44. Women's costumes.

301 [237] /139/ The favorite dance and war ornament on the head of the warrior is the well-known face frame with ostrich feathers stuck around it. It consists /Ill. 45 and Figs. 39 and 40 appear here/ of two leather disks sewed one on the other, the front one of which bears a row of narrow mesles stitched on a strip of thin goat leather, which serve for holding the feathers. The most popular ones, as the name os sidai, /140/ "the beautiful" (which, incidentally, also holds for ornamentation in general), says, are those of black feathers; if made of white feathers it is called eń gŭrărŭ, and if it bears only one white feather at the top, eń dărgĕ. Besides that, they have such frames made out of the bent wood of a liana runner. At their highest point is stuck the tail of a Colobus monkey

[237] [136]

• [136] (ol goroi, Colobus caudatus) drawn onto a stick. The ornament is
[237] called ol bidibit (el bidibidi). At the forehead and occiput the
frame is held fast by a strap (e reschet) passing through it, while
its lower end is clamped under the chin or lower lip. Another

301 ornament is bent W-shaped out of liana wood and hung with
291 feathers (ol marangusch [Fig. 40]). Also popular among the
292 warriors in the field and for dancing, but rarer, are the foot-high,
237 pointed warrior caps, ol ugaru, with the designation of the skin
added, made out of the skin of wild animals. The cap usually
consisted of only one type of skin; more rarely a narrow strip of

291 /140 cont./
237 another skin is sewed on the seam going from the tip toward the
[292] back. Most common are the caps out of lion manes (ol ugaru kitok
• [136] or ol gnatunj = lion) or the skin of the baboon (ol dŏdăl, Papio cynocephalus), resembling it almost perfectly in appearance. Furthermore they use the skin of the leopard (ol ugaru gĕri; gĕri = spotted), Indian leopard (Cynaelurus guttatus, ol /141/ genja l ascho = calf-devourer), serval (Felis serval, eñ gerassi = biter, he only bites the goats and sucks their blood), Colobus monkey, jackal, and hyena dog (ol oibor gidoñoi). A strap holds the cap fast under
[294] the chin. The warrior sews the cap himself. Awl (ol dedo, el dedi
[283] [Fig. 41]) and a twisted cattle tendon (eñ obini) serve as needle and thread for all needlework. Another cap worn by warriors, boys and
[531] older men has the shape of a baby's bonnet (Figs. 42 a and b); it is made out of the honeycomb of a head of cattle and often adorned on the edges with small beads.

Merker phot.

Ill. 46. Ear ornament of the men.

/141 cont./

301 In order to make the ears suitable for holding ornaments, their
304 lobes are pierced in early childhood with a strong acacia thorn and distended by the insertion of longer and longer wooden plugs. The
[824] plugs (Figs. 43 a and b) are mostly made out of the
[531] eñ gadardar tree (Ochna Merkeri Gilg), often quite beautifully marked. The weight of the ornaments enlarges the holes still more, so that they often hang down extended ten centimeters. At the same time the upper edge of the ear is also pierced in one or two places.
301 In these the women wear bunches of four to eight small chains to 20
[237] centimeters long (Fig. 44); the men wear just as many el oimer
[136] (sing. ol oimeri), a clock-key--shaped ornament made out of tin (Figs. 45 a and c) or out of brass wire (Fig. 45 b), often also a pesa on a wire ring, a polished mussel shell, which ornament /142/ is called eñ jili (n jil) (Fig. 46), or a wooden stick 15 centimeters long (ol benieta, el benieta [Fig. 47, upper part]), or a quill of the porcupine (oiaiai or oeai, Hystrix africae-australis). Around the lower part of the enlarged ring of skin of the ear lobe the men wear a tube four centimeters long (ol gissol, el gisso [Fig. 47]), wound out of thin iron wire, /Figs. 47-51 appear here/ whose end coils are wrapped with copper wire, while on the rest of the coils usually hang small chains 6 to 20 centimeters long (ol bisiai, el bisia). If these are only short, they are as a rule glued together with red paint (Fig. 48). In place of this ornament one also often sees an oval,
[824] perforated tin disk (eñ goholai, ñ gohola) and other things, or a nut-shaped ornament that /143/ is carved out of the nut of the Hyphaena palm (Fig. 49). Married women and old men wear, tied in the ear lobes with a thin strap, the large double spirals (e (e surudiai, surudia) made out of thick brass wire. They are supported by a leather strap put over the crown of the head, since, because of their great weight, the ear lobe is unable to do so. It is
[531] regarded as particularly beautiful if they are further decorated with a leather band sewed across them and stitched with four rows of small beads, on which hangs a row of small chains. This decoration, which, incidentally, is found only among women, is called ol
[535] giriengata. For dancing, young girls often wear a string of beads (Fig. 50) around the forehead and occiput, or two strings of beads lying one above the other an inch apart (Fig. 51), which are joined, ladderlike, with small chains. The ornament is called er naitule.

[TEXT CONTINUED ON PAGE 189]

/144 cont./

301 duréschi, el durésch), oblong, bean-shaped white beads (es sambaín), date-pit--shaped, multicolored figured beads (em boro), ring-shaped blue and green beads (eń gonoňgoi, ń gonoňgo), and various wire rings. The beads are either strung on wire and cord twisted out of cattle tendons, or also sewed on narrower or wider, flat leather rings. [531] In the latter case the beads are arranged, according to color, in rectilinear, mostly square designs (Fig. 53). Such a bead band is [237] called e mairenai. The middle piece of such circlets, lying on the chest, often consists of a taler sized piece of snail shell ground flat (ol gǎlásch, el gǎláschi), on the beaded border of which hangs a row of small chains (Fig. 54). With this material consisting of beads, wire, and leather circlets the most varied and all conceivable combinations are formed, which everyone designates by the part of it most conspicuous to him, so that there is no fixed nomenclature for them. Special mention should be made of a string of beads regarded as particularly beautiful and chic for young women, in which em boro beads alternate with rows of small glass beads and spirals of brass wire two or three inches long and which is worn bandoleerlike over the left side of the chest.

301 237 As a war ornament the el morǎn often wear a sort of shawl, a cross between a cape and a ruff, consisting of vulture feathers. The ornament is called ol mǎíruti or ol motonj=the vulture; each individual cord on which the feathers are strung is called eń gobír.

Besides a simple bead ring, a leather band stitched with beads (ol gilescho, el gileschoni) or an ivory ring (ol mǎsaňgus, el mǎsaňgusi), the men, especially the warriors, often wear on the left upper arm a bracelet of sheep horn in the form of a double chopping-knife (e ráb, e rábbi [Fig. 55]). [136] If one goes to a festival or goes to war there hangs on it a meter-long, twisted strip (ol kibaba, el kibabani) made out of the skin of leopard, Indian leopard, serval, jackal, furthermore of the genet (ol dolúgo, Genetta pardina), zoril (ol belés ǎte, Jetonyx /Ictonyx/ zorilla), zebra mongoose (ol gischoren, Crossarchus fasciatus), tree conies (eń gine os soito, Dendrohyrax validus), and of a squirrel-like animal (ol gidás eń dare = goat-milker; the Masai generally relate that it sucks on the udders of the goat at night), the

/144 cont./

301 yellow long-tailed monkey (Cercopithecus pygerithrus, eñ dŏrasch),
237 the black long-tailed monkey (C. albigularis, ol gĕma), the honey
[036] badger (Mellivora ratel, ol belĕs), and a few other smaller animals.

301 Around the right wrist, often covering almost the entire lower
554 arm, those warriors who are generous and benevolent, the ñ gamnini, wear a cuff (Fig. 56) that consists of rows of iron beads (el dorongĕn or el gabaten) put close together, in whose place in more recent times appear ordinary small -- especially blue -- glass beads. The iron beads are made by pounding flat small wire rings and then /145/ putting these, strung on thin strips of sheep leather, around the lower
[431] arm and knotted on the inner side of the arm. Those people who constantly enjoy the kindnesses of the ñ gamnin express their gratitude from time to time by giving a string of such beads, so that, as was said, the ornament often extends almost to the elbow. More rarely than among warriors, the ornament is also found on one or
[431] another of the young girls living in the warrior kraal. If a girl has
[593] no brother belonging to the warrior standing, but does have a wealthy father, she receives from the latter both milch cows and an occasional

301
291

Merker phot

Ill. 47. Arm and leg ornaments of the women.

/161 cont./ The cattle are zebus (Bos indicus) among
233 which one can distinguish a stocky, short-horned breed and a thinner,
[136] long-horned one. One almost never comes across pure representatives of either, however, rather, as a result of plunder and crossbreeding, all the types occurring in East Africa are represented among them. The actual Masai cattle (ń gischu el masai) scarcely exceed in size the average East African cattle. The foreign, that is, stolen, cattle especially prized are: on account of its considerably larger size, the livestock from Irangi and vicinity (ń gischu ol datua), that from Unyamwesi and Usukuma (ń gischu ol moibaro), and further the large-horned ń gischu e kiteto, named after the steppe area of Kiteto, west of the area of Nguru. Among all the udders are relatively small and the yield of milk is consequently little. An exception to this is a low, stocky breed with short horns, which produces a double quantity of milk and about which the Masai maintain that they are quite pure descendants of the old Wakuafi cattle (ń gischu el lumbua). The Masai call descendants mańgá. Since the calves
234 are not permanently separated from the cows, the women try to avoid the natural restlessness at the milking by bringing the calf close to the cow during the milking. They place themselves astride it and hold its head firmly with the knees. The cow licks the calf, believes that it is sucking, /162/ /Ills. 51 and 52 appear here/ /163/ and is quiet. If the calf dies, one deceives the cow about its presence by hanging the freshly dried /Fig. 74 appears here/ skin over a stick. The cows are milked twice a day, morning and evening, and each time give about one and a half liters of milk. They are never milked completely; rather one leaves the calves with them afterwards. Until the calf is two months old, it is given the milk from
232 two tits, while the other two are milked. The principles of breeding and selection in general are well known to the Masai (Fig. 74). Male calves that are not to be used for breeding later on are castrated
[412] at the age of 14 days (a-gelém). With a sharpened /Ill. 53 appears here/ piece of sheet iron, such as is used for shaving, a cut is made in the scrotum, then each testicle is grasped with the hand and pulled out, together with the spermatic cords. "So that the wound may heal more quickly," one sticks in a dead fly and ties one of the removed testicles around the left foreleg of the calf operated on.

[TEXT CONTINUED ON PAGE 217]

/170 cont./

232 233 horny scar often five centimeters high, /171/ through which the inoculated animals, which are now supposed to be protected against becoming sick with tuberculosis, are permanently marked. Numerous observations in this direction showed me the justification of this view. [176] [791] The ol oiboni Mbatyan is regarded as the inventor of the inoculation method.

[136] In some years, and, to be sure, in the rainy season, great multitudes of dark green caterpillars one to one and a half inches long are found in the grasses of the steppe. Cattle that eat the caterpillars are stricken with eng ea el gurt (ol gurto = the caterpillar). As symptoms of the sickness I observed: first a few hoarse coughing sounds, then giddiness, which rapidly mounts and makes the animal stagger as though out of drunkenness; soon it lies down and is brought to a standing position only with difficulty, only to lie down again after a few minutes, whereupon death occurs often after only half [411] an hour. The treatment consists of bloodletting by an arrow shot (Fig. 76) into the jugular vein, whereby one to one and a half liters of blood is emptied out. Through that recovery is reached after just a few hours, as I observed in over 100 cases (1).

1. The microscopic examination of blood slides (ear, heart, spleen) of sick and dead animals gave a negative finding (Oberarzt /staff physician/ Dr. Grothusen). I observed the appearance of masses of the caterpillars in March, 1898, in the steppe south of Kilimandscharo, in December, 1902, in the steppe southwest of Kilimandscharo, in the entire region between the latter and Lake Manyara, and in April, 1905, in Daressalam /Dar es Salaam/.

[177] In another case, out of four head of cattle, after two had already died of the sickness, the other two, through the infusion of an emetic consisting of a mixture of sugar-cane beer and a tobacco extract, which was given upon the advice of the Wapare in Manamata on the southern end of Lake Jipe, could be cured.

/173/

233 The foliage of the ol jani l el sirgon tree (Cadaba farinosa),
232 that is, tree of the donkeys, is regarded as poison for donkeys.
[231] Besides a horsefly, ol gimbai l ol sirgon, from whose bite the
[824] donkeys (bitten in the penis) are stricken beyond recovery, the Masai
[136] also fear for donkeys and cattle the tsetse fly (Glossina morsitans),
which they call en dorobbo. The latter is allegedly only dangerous to cattle if it bites them in the tip of the tongue. One seeks a cure by cauterizing the spot bitten, but the result is very doubtful.

For getting rid of fleas, one washes young livestock with an extract from the crushed plants of ol osidja gutok (Asystasia gangetica L.) or from ol abai (Microglossa spec.).

The powdered root of ol girigir (Acacia pennata Willd.) is blown into the nose of calves and small livestock, in order to drive out the maggots of the throat fly /warble fly/.

233 Cowbells (Fig. 77) in the form customary in Europe are found
534 generally, but here they are hung especially on oxen and only on those cows that do not tolerate their calves. Smaller bells, often

Fig. 77. (1/4)

Fig. 78. (1/4)

of wood or sheep horn with wooden clappers, are worn by castrated
233 sheep and goats. As adornment one hangs around the neck of castrated calves clapper-shaped pieces of ivory (Fig. 78) or, for especially handsomely developed cattle, a leather band or a cord stitched with cowrie shells.

/175 cont./

136 [262] [224] Since the Masai do not eat game meat and hence do not pursue game in any way, it is usually very tame in the vicinity of the kraals and often grazes along with the cattle. The author saw an unforgettably beautiful scene in mid-1897 in the circular valley of Ngorongoro, where large herds of gnus and zebras, as well as Grant's and Thomson's gazelles, were grazing quietly and without any trace of fear beside and among the cattle herds of the Masai.

192 231 From the extensive nomencalture for the livestock, only the most important words are given here:

ń gischu, cattle in general;

ol oiñoni (el oiñok) or (very rarely) ol mögira, bull;

ol geteń (el moñi), ox;

eń geteń (ń gischu), cow;

eń geteń naigauo nabo, cow that has calved once;

eń geteń natoïsch are, cow that has calved twice;

eń geteń 'lebon, cow that has calved a number of times;

eń geteń olobí, sterile cow;

ol gedari (el gedari), small calf in general, which stays near the kraal;

ol medimí (el medímí), older calf that is pastureed farther away;

ol arám (el aramí), older calf that grazes in the vicinity of the large livestock;

ol boñai (el boñaikog), male calf;

ol asche or ol ahe (el asche, el ahe), male calf;

en dáuo (en dáuno), female calf;

eńg asche (ńg asche), female calf;

os sigiria (es sirgon), donkey in general;

ol amué (el amuschi), male donkey;

/176/ os sigiria oidoń (es oidoño), castrated male donkey;

es sigiria (es sirgon), female donkey;

es sigiria naigauo nabo, female donkey that has foaled once;

es sigiria eleboń, female donkey that has foaled several times;

ol gurarú (ěi guraruani), male donkey foal;

eń gurarú (ń guraruani), female donkey foal;

os sitimá (es sitimán), full-grown male head of small livestock;

361 /177 cont./
233 animals that go forward only with difficulty are carried in the arms.
[561] Boys take care of the livestock driving, under the supervision of
[701] married men. With each party is found a stronger guard of warriors.
[492] Meanwhile the women are still busy with the loading of the donkeys, on which all the household equipment is packed. More rarely a few oxen or cows must help out. After this work is finished, the herd of donkeys follows the tracks of the livestock. Behind them come the women, girls, and children; almost every one of them also drags along some household object or at least a small-livestock or neat
[701] skin. Oddly enough, a guard of warriors is not found with this party, as there was with all the preceding ones, but rather at most a few old men armed with spears or bows and arrows. Usually the destination is reached on the same day. If this is not the case, however, camp is pitched during the night within a hastily constructed barricade of thorny branches. The next morning the march then continues
361 before daybreak. After arrival at the new site the women immedi-
462 ately start laying out the kraal. First the thorn barricade is laid out, and in the following days the huts are built. Erecting the kraal proceeds very rapidly; as a rule it is finished in a week as the latest. The old kraal was not destroyed upon being vacated. It is left standing and reoccupied later, after the pasture has recovered. Meanwhile, of course, much has deteriorated, so that the work of reconstruction almost equals that of a new installation. In the last
[136] few years, since the sand flea (Pulex penetrans) has become a pest in East Africa, the reoccupation of old kraals is declining more and more. In order to destroy the noxious insects inhabiting them, they are burned when vacated.

000 It is obvious that the European who wants to engage in stock-breeding here cannot move about with his herd in the manner of the Masai. Moreover, a division of the herd in such a way that sufficient grass is present throughout the year within range of the kraal for the individual parts does not seem feasible, and, to be sure, especially because of the difficulty of personal supervision and observation of the sicknesses arising, as well as of isolation in case of an epidemic. An improvement of the pasture by means of

/180 cont./

757 and the chewing of the root of ol asajét (Withania somnifera Z.) are regarded as acting especially vigorously. Children are given an infusion of the leaves of ol magingi (Moschosma multiflora [Hoch.] Bth.), because it has a considerably milder effect.

753 757 They call another greatly feared fever ol oirobi l'en duhúr and see its original cause in the bite of a kind of tick living underground, which they designate as en duhúri jámon. The patient is given liquid sheep fat mixed with the powdered grains of ol odoa (Maesa lanceolata Forsk.). Presumably this fever is identical with relapsing fever, for [136] [164] which Professor Robert Koch identified as the carrier of the spirilla a species of tick living underground (Ornithodorus Larigni) (2).

2. During the day Ornithodorus hides in cracks of buildings or in the ground and emerges as soon as a victim approaches. Merker's conjecture could therefore correspond to the truth, and the more so since to me too the Masai designated and displayed an unquestionable Ornithodorus as the carrier of a fever. The ed. Dr. S.

757 [164] Against chickenpox (e riri or en diaboboń) no medicine is known. The sick person remains in the hut, is given as a drink a little milk mixed with fresh blood and sheep-tail fat, two things that are regarded as strengthening; furthermore, as food, a piece of mutton roasted in the skin at the open fire.

[751] For protection against smallpox (ol maschúgu or ol minjaloi) healthy persons are inoculated in two incisions on the forehead with the smallpox pus en gimek) of a sick person. Smallpox patients are [164] given a decoction of the roots of en dulele (Solanum campylacanthum) mixed with cattle blood as a diaphoretic and at the same time a nourishing remedy. In order to increase the sweat secretion, the [758] patient is laid beside the hearth fire. Diet; no drink except the above-mentioned medicine; as food, the head of a sheep roasted in the skin or another piece of mutton similarly prepared.

/191 cont./

752 paste of the pounded leaves of a climbing species of asparagus (em bere e baba). The taking of an extract of the root and bark of ol

[237] gelai mixed with cattle blood and milk is regarded as beneficial for the healing of suppurating wounds. The decoction of the wood of a Rhus species (ol mesigiš kete) is supposed to have a similar effect, in that taking it "makes the wound dry."

Sand fleas (1).

• [136]

1. The sand flea was brought into the Masai region in 1897 from Uganda. In June, 1897, it reached Kilimandscharo.

the females of which in particular eat into the soft skin parts of the feet, are removed as soon as they manifest themselves by an itching pressure resulting from their egg-swollen bodies. By means of a sharp scratch with a long acacia thorn, one pierces the layer of skin, usually only quite thin, lying over the sand flea (2)

[114]

2. Here M. is mistaken: The tip of the rear abdomen of the female sand flea juts out into the open, without any skin covering. The Ed. Dr. S.

and then squeezes it out by lateral pressure. During this one is careful to avoid injuring the animal, so that healing will not be delayed.

/192/ For snake bite (a-tonjo 'l assurai) one thoroughly squeezes out the hastily ligated wound, around which one has also made a number of punctures with the sharp thorns of ol gurschaschi (Barleria mucronata) and then cauterizes it with a red-hot iron wire. At the same time the root of ol asajet is chewed, whereupon vomiting follows. This method, however, is customary only if the one bitten is unable to reach a surgeon. Otherwise one has the ol abani fetched immediately and, until his arrival, burns out the immediately ligated wound several times. Swellings of the lymph glands that may occur are also cauterized. If the ol abani regards the bite as only slightly poisonous, he enlarges it by means of a few incisions and sucks it out vigorously. But if he regards it as dangerous to life, he cuts out around the bitten spot a piece of muscle from the size of a nut to

*137
[136] example, and they move on. Some years the grazing pattern may leave little dry grass standing in a given area and a hot fire will not be carried there. But other seasons' pattern will be different and the remaining dry material will carry a hot fire. Even in areas where the yearlong biomass of wild ungulates is highest there is usually enough dry grass left standing at some season each year to support a fire.

Where the grass cover is not utilized by grazing, burning, or clipping, the larger bunch grasses grow into very large clumps, dead at the center, with bare ground between them. The ground cover in such areas may be from around 40 to 55 per cent. Small grasses disappear presumably through competition with the larger ones, and typically only 10 to 15 species will be common. The effect of grazing, clipping, or some fires is to maintain a grass cover composed of many vigorous medium sized bunches, rather than a few large bunches in undergrazed land, or many seedlings or annuals in overgrazed land.

*13 Figures 64 through 72 illustrate the effects of different degrees of grazing, with consequent changes in vegetation composition and soil cover.

MASAI HERDS AND MARA LIONS

For Westerners the Masai have become the symbol of a vanished aristocracy, a lost cause they can afford to keep as a household pet who has the spunk to stand up to its master.

The Masai way of life is certainly doomed. For a while it may continue, but nothing in the end can resist the pressures of Western materialism. The British have protected it by freezing a tribal pattern of land ownership, enshrined in a treaty to which the Masai hold with all the desperation of a man clinging to a raft when the waters are rising. That treaty, which confirms them in possession of their grazing-grounds 'for ever', was made to keep out Europeans. Now it is no longer white settlers who threaten them, but black ones. Will a treaty made for the one purpose serve for the other? Only while the British enforce it; when politicians of the land-hungry Kikuyu and Luo peoples occupy the seats of power in Nairobi, the borders of Masailand seem unlikely to remain intact.

For here lie the last reserves of fertile, well-watered and unused land in Kenya, hitherto protected by the strongest guardian of the land in Africa: the tsetse fly. In the last ten years, modern techniques of mastering tsetse-borne diseases, and the tsetse fly itself, have reached a point where all this land could be thrown open to settlement. The question now is partly one of expense, and partly of politics. The Masai themselves do not cultivate. So long as their treaty with the British Government holds good, they will resist to the last man the opening of their land to settlement by the cultivating tribes.

II

The Tanganyika-Kenya border cuts through the Masai's territory, most of which is open, semi-arid grassland useless for any purpose other than seasonal grazing by scrub cattle, even if water could be tapped by boreholes. But in the west, where Masailand approaches Lake Victoria, and on the Mau escarpment's south-western slopes, soil and rainfall would support a sizeable population of cultivators.

The Masai, numbering about 85,000, keep about one

but to the Masai as a watering place. Situated at an altitude of 4,000 feet it is 133
flanked on the east by the Kikuyu Escarpment, and on the north-west by Mount Suswa. Water is not procurable during the dry season, but the area is used by the Masai during the rains when most of the available water then runs to waste.

The country between the Kedong Valley and the Uaso Nyiro at Van de Weyer's Drift, is cut up by deep escarpments and studded with isolated hills, interspersed by jagged edged dongas, all of a volcanic nature. The soil is, for the most part, a sandy orange dust. The hill sides are covered with rough thorn bushes and minosa scrubgrass which a considerable amount of good grass is apparent. The area is practically waterless at most times of the year, but the appearance of watercourses indicates the presence of large bodies of surface water during the rains. [134] [137]

Near the Uaso Nyiro lies the country known as Ronjo, level grass country, which affords permanent grazing for large herds of cattle all the year round on account of the proximity of the river and the consequent regular water supply.

To the east lies the country known as L'Odo Kiboi, which is the northern extremity of the barren country round Lake Magadi.

The Uaso Nyiro, which is taken as the dividing line between the eastern and central portions of the Masai Reserve for the purposes of geographical description, flows into a swamp to the north of Lake Natron, which contains the lowest part of the reserve, being no more than 2,027 feet above sea level. The valley is fairly healthy in dry weather, but in the rainy season the inhabitants move westwards to the summit of the escarpment, which rises in a series of abrupt and rocky ridges on the right bank of the river from the Anglo-German boundary as far north as the Narosura River. The central portion

West of this escarpment stand the Loita Hills, rugged masses extending over a wide area of country, watered by frequent streams, and of an altitude generally greater than 7,000 feet. These hills form the watershed of the tributaries of the Mara River, the chief of which in these parts is the Olkeju l'Ongaisort, which follows a course nearly parallel to the boundary and which enters the Mara River as it crosses the border. The Loita Hills present good grazing grounds, well supplied with water and grass, but they are too mountainous and rocky in places to be utilised to their full capacity.

North of the Narosura, and before reaching the Loita Plains, the Narosura Plains present grazing areas of the first quality, whose undulating slopes carry heavy crops of grass and are much frequented by Masai cattle. Permanent water is obtainable at regular intervals from the small tributaries of the Narosura.

The Loita Plains are entered at the Ragare Eato and, though there is a deficiency of permanent water in this part, the grazing is otherwise good. The extensive areas comprised in the north-eastern portion of the Loita Plains consists of very open and bleak country, swept by cold winds, which send the temperature at night down to well below 40° F. and carrying a short close grass, which is more suitable for sheep than for cattle. The eastern boundary of the Plains is the Uaso Nyiro, which has not at this time entered into its deep ravine. At Van de Weyer's Drift the river is some twenty yards wide, running with a strong current between fairly high banks and of a depth varying at different seasons of the year, but rarely less than two or three feet deep at the drift. North of Narok Station the heights of the Mau rise through thick bush and forest country, well watered, but practically unusable for stock, to the top of the range and it is through this country that the Uaso Nyiro, with its tributaries, fall until they unite near the drift. [132]

West of the Narok lies the main portion of the Loita Plains, a vast area of open grass country, level, or slightly undulating, intersected with small watercourses, which hold water in the deeper cavities and in the neighbourhood of numerous springs at most seasons of the year, and dotted at intervals with copses of bush and occasional clumps of mimosa, a country which possesses magnificent possibilities as a grazing area if a few engineering projects are undertaken to

6:Thomson K-3 (1883-1884)1887
FL12 Masai FL12

The northerly or higher plateau region of Masai Land may be described as rising from an elevation of nearly 5000 feet on either side, and culminating in the centre at an elevation of little short of 9000 feet—although through this very line of highest elevation runs from the Dogilani plain the remarkable meridional trough which encloses the charming chain of isolated lakes, Naivasha, Elmetoita, Nakuro, and Baringo; and which, at the last-named place, begins to widen out till it assumes the characteristics of the southerly plain of Masai Land. 133

On the eastern half of this divided plateau rises, as we have seen, the snow-clad peak of Kenia—and the picturesque range of the Aberdare Mountains, which runs almost parallel with the central line of depression. A more charming region is probably not to be found in all Africa, probably not even in Abyssinia. Though lying at a general elevation of 6000 feet, it is not mountainous, but extends out in billowy, swelling reaches, and is characterized by everything that makes a pleasing landscape. Here are dense patches of flowering shrubs; there noble forests. Now you traverse a park-like country enlivened by groups of game; anon, great herds of cattle, or flocks of sheep and goats are seen wandering knee-deep in the splendid pasture. There is little in the aspect of the country to suggest the popular idea of the Tropics. The eye rests upon coniferous trees, forming pine-like woods, and you can gather sprigs of heath, sweet-scented clover, anemone, and other familiar forms. In vain you look for the graceful palm—ever present in the mental pictures of the untravelled traveller. The country is a very network of babbling brooks and streams—those of Lykipia forming the mysterious Guaso Nyiro; those of Kikuyu the Tana, which flows to the Indian Ocean through the Galla country; while further south in Kaptè the streams converge to form the Athi River, which flows through U-kambani to the Sabaki River.

Kikuyu occupies the higher areas of the eastern half of the plateau, cutting across it immediately south of the equator. Some of the higher parts are covered with a dense forest of bamboo; notably to the east of Naivasha, and between it and the Aberdare Mountains. Hence the Swahili name of one recruiting-place—Mianzi-ni (Bamboo Country). [137]

The greater part of Lykipia—and that the richer portion—is quite uninhabited, owing, in a great degree, to the 361 166

imbecility—or perhaps not remarkable, since nothing has been more characteristic of the half-century of European intervention in Africa than the slap-happy introduction of bright, well-meaning ideas by enthusiasts of all kinds, without any regard for their long-term consequences.

Anyway, vets controlled diseases, livestock multiplied and their hoofs and mouths destroyed the precarious grass cover of the plains. The result is that, except where the tsetse fly remains in control, the Masai are living in country poised upon the edge of deserthood. Some of it has gone over the edge, some hovers on the borderline, some has not reached it yet. And so pressure mounts upon those regions that are still protected by the tsetse fly.

Overcrowded people outside want to get in, overstocked Masai themselves want to take their herds where grazing is still rich and deep. If either succeed, unless they adopt very different methods, they will destroy those regions as surely as they have damaged their present inheritance. Agricolas and vets do not want to see these last remaining areas opened up without strict control. But governments are terrified of controlling anyone by what may be represented as harsh measures, and administrators have inclined to caution since the Masai speared to death a D.C. who was persuading them to sell some steers. So the matter, like many others, rests in a state of suspended flux, and everyone hopes for good rains.

III

Down on the Kenya–Tanganyika border, not so very long ago, there lived an Englishman who kept in touch with the world by carrier-pigeon. For three or four months of the year no vehicle could reach him, and even in the dry weather it was a long, hard, bumpy seventy-mile journey from Narok, where the road ends. The aeroplane has changed all that. An hour's pleasant flight from Nairobi brought us comfortably to rest beside a tributary of the Mara river.

First we flew over the Mau, that range of mountains forming the south-western wall of the Rift Valley. Covered with forests of cedars and olives and, higher up, of bamboos, the

21:Huxley Q, T-5 (no date) 1960 FL11 Luo
Masai FL12

133 Mau is the source of all the rivers watering the western half
[137] of Masailand, Kipsigis and part of the Rift Valley. The birthplace of innumerable streams, it is, in theory, protected by its status as a forest reserve.

185 Looking out from the small yellow aircraft expertly handled
311 by June Wright, one of the best commercial pilots in East Africa, one could quickly see how different theory was from practice, here as elsewhere. In a forest reserve no one is allowed to fell trees, cultivate, start fires or graze livestock. In less than half an hour, I counted seventeen active fires and saw the shambles created by innumerable others. Whole ridgebacks of the mountain, sticking up like black spines, were as bare as slag-heaps and already runnelled and creased by gully erosion. Older fires were still smoking in some of these devastated areas; one could see the forest being eaten into like a great fur pelt attacked by moths.

As sure as fate, one day there wil be no more water for cattle in the streams below. 'God is punishing us,' will say the Masai: but it will not be God, it will be themselves. The
[233] streams are already shrinking and the Masai are driving their herds farther into the hills to find grazing. They cannot take cattle into forest and so they burn a way in. They are creeping upwards, spreading destruction as they go in order to escape the consequences of destruction they have already caused.

[222] Other fires are started by honey-hunters who burn down trees to smoke out the bees. Often, in the forest, you can see blackened hollow cedars and olives kiled by fires tucked into the roots. If the foliage is dry and the wind right, the fire will spread and get out of hand.

563 And then there are 'acceptees': a clumsy term given to men of other tribes who are settling in Masailand, family by family, with the permission of Masai elders. They are tenants: but it is very unlikely that they will ever go.

[167] In South Nyanza and in Kipsigis it is reckoned that upwards of two thousand families a year are crossing the southern border into Masailand and Tanganyka. In recent years a
[582] good many Masai have married Kikuyu or Kamba wives
[842] because so many of their own women are sterile; at one time there was quite a trade in Kikuyu girl-children, exchanged for cattle.

14:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Kikuyu FL10

K 146 the diet without materially affecting the amounts and proportions
[128] of the protein, fat and minerals.

From this table it appears that the diet of the Kikuyu male is adequate in protein* (see discussion below p. 20), but very low in fat. It contains more than enough phosphorus but is very low in calcium and possibly low in sodium. If it be assumed that the women alternate common irio with their own dish, then their protein and fat are much as those of the men. Their phosphorus intake is also roughly similar, but their intake of calcium and sodium is much higher than that of the men. Their daily intake of calcium is over 1 gm., and must be considered to be about the optimum intake.

M 146 In contrast with this picture, the Masai diet contains a liberal supply of the mineral elements and a large excess of protein and fat, but is low in carbohydrates. It must also be low in cellulose and other indigestible residues.

(*d*) Physical Condition.

K M 128 *Measurements.*

In constructing the tables of physical measurements,[1] the data have been arranged in age-groups, up to and including 30 years of age. Actual ages are, of course, not known by the people themselves and, therefore, only an estimate could be made, but the factor of error will be the same with regard to both Kikuyu and Masai. The figures were arrived at as a result of questioning with reference to outstanding events.

The numbers in the different groups are given in Appendix 2 along with the detailed figures. The results are shown in convenient form in the accompanying graphs, in which they are compared with standard English measurements.

K M 141 *Height.*—A comparison of the average heights of Kikuyu and Masai males (Graph 1) of the same age, shows that the Masai grow more rapidly than the Kikuyu and reach a greater mean adult height. At their maximum about the age of 20, there is a difference of almost five inches. At the same age, Masai women (Graph 2) are three inches taller than Kikuyu women. The Masai children M 145 146 appear to grow more rapidly than English children. This may be due to the fact that their chief article of diet is milk, since it has been shown in experiments with Scottish school children that the feeding of additional milk increases the rate of growth (Orr, 1928; Leighton and Clark, 1929). The total number of Masai children measured is, however, too small to make such deductions reliable.

K M 141 *Weight.*—Graph 3 compares the rate of increase in weight of Kikuyu children from birth to thirty months of age compared with that of English and of American infants. During the first month the Kikuyu infants are about half a pound lighter than English.

* In considering the relative adequacy of Kikuyu and Masai diets it has to be borne in mind that the biological value of the Kikuyu protein is considerably lower than that of the Masai which is derived from meat and milk.

[1] [See Appendix II, Category 116, pp. 79-80--Analysis]

14:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Kikuyu FL10

This is in agreement with observations on the birth-weight of Kikuyu children by Anderson, G. V. (1929). The rate of increase in weight is roughly similar for the first ten months, but thereafter the Kikuyu increase much more slowly than English or American and are about 8 lbs. lighter at 30 months. We have no data regarding the birth-weight or rate of increase of Masai infants. K M 141

In Graph 4 the weights of Kikuyu and Masai males are compared with English standards. The Masai male is uniformly heavier than the Kikuyu, but lighter than the English. The difference between Masai and Kikuyu becomes more marked after the age of 15 years, and at the age of 20 the Masai average 23 lbs. more. The difference between Masai and Kikuyu females (Graph 5) is even greater, the Masai approximating to the English standards. The average weight of Masai women in the 21-25 age group is 27 lbs. above that of Kikuyu women. It is noteworthy that Masai of both sexes show, on the average, a decrease in both height and weight after the 25th year. A similar decrease occurs in the Kikuyu, but not until the next quinquennium. Early senility appears to be common to both tribes.

In addition to being superior in height and weight, the Masai are typically larger in the chest and smaller in the abdomen than the Kikuyu. (Appendix II, Tables V and VI.) K M 147 141

Strength.—Average dynamometer readings at different ages are compared in Graph 6. From the earliest age the Masai give evidence of superior strength. At the maximum the males achieve an average hand pressure of 88·8 lbs., which is 30 lbs. more than the maximum for Kikuyu males. The Kikuyu male shows a strength which, indeed, is just equal to that of the Masai women, and is only at the maximum about 10 lbs. greater than that of Kikuyu women. This evidence of inferior strength on the part of the Kikuyu, especially the male Kikuyu, is supported by what we know regarding his very low capacity for work and power of endurance. Unfortunately, we have no information as to capacity for work in the Masai.

(v) Clinical Observations—Incidence of Disease.

Signs of malnutrition and symptoms suggestive of rickets are common among Kikuyu children, the males particularly being affected. Few cases of early rickets at the typical age came to the field worker's notice, but signs of late rickets were commonly observed in this tribe. Thus, of 1,325 boys examined, 830 (63 per cent.) had some osseous deformity such as genu valgum, genu varum, flat foot, scoliosis, beading of the costochondral junctions, rickety rosary, or cranial bossing. K 146

It is known that yaws produce bone deformities of many kinds, and it is, therefore, important to know what part of the above deformities may be attributable to yaws. There are no reliable figures showing the general incidence of yaws in children. Philip (1927, 1) gives the incidence amongst school children in one district as about 15 per cent., but this figure is not applicable to the general K 144

Kikuyu FL10
Kenya FL1

Ka 164 146

In the absence of further information, it can only be said that the results of this investigation suggest that susceptibility to ulcer, which appears to be general amongst natives on ill-balanced diets of the type mentioned, is correlated with a high blood inorganic phosphate, occurring with a normal, or slightly subnormal calcium, and that the actual occurrence of ulcer is associated with an exaggeration of this abnormality.

IV.—SUMMARY OF RESULTS.

Ka 146 164

Preliminary observations and a review of existing information suggested that disease is more prevalent amongst native races than is generally supposed, and indicated that the incidence of certain diseases might be correlated with diet.

A survey of two tribes, the Masai and Akikuyu, showed that the diet of the former consisted to a large extent of milk, meat and raw blood, and that of the latter mainly of cereals, roots and fruits, the bulk of the diet being cereals. The outstanding points of difference in chemical composition of the two diets were that the Masai have a relatively very high intake of protein, fat and calcium, while the Kikuyu have a high intake of carbohydrate and a low one of calcium. Differences were found in the dietary customs between men and women in both tribes, the diets of the females approaching in each case to the mean between the diets of the males.

Ka [142]

Physical measurements showed that the full-grown Masai male is on an average, 5 inches taller and 22 lb. heavier than the full-grown male Kikuyu, and his muscular strength, as determined by the dynamometer, is 50 per cent. greater. Marked differences were found in the incidence of disease in the two tribes, bony deformities, dental caries and anæmia, pulmonary conditions and tropical ulcer being much more prevalent amongst the Akikuyu. On the other hand, intestinal stasis and rheumatoid arthritis were more common amongst the Masai.

Ka [141]

Analyses showed that routine Hospital and Prison diets are markedly deficient in calcium, the average daily intake being only about 0·3 gm. Ca, as compared with the assumed requirement of about 1 gm.

Ka [146]

Examination of the blood of Kikuyu and other natives on a similar dietary showed that the concentration of calcium was lower than the European standard, the average of 90 cases, prisoners and farm labourers (not pathological) being 9·4 mg. per 100 c.c. serum, as compared with 10·0 to 10·5 mg. in Europeans at home, and 11·4 mg. in 13 Europeans in Kenya. The range of variation in blood calcium was wide, from 7·3 mg. to 11·2 mg., the highest figure being below the mean for Europeans in Kenya.

B. Physical Measurement.

MD 141 [123]

During the taking of the measurements, the people appeared very reasonable and neither shy nor particularly awkward; I was, of course, no stranger to them, but rather an old acquaintance, who, through firm pressure of the legs of the caliper compass or beam compass, could even cause them slight pain without making them restless or anxious.

My instruments, besides the aforementioned compasses, which are part of the Bertillon case, consisted of an ordinary recruit measure and a steel measuring tape.

MD 141 128

/433/ Of the double numbers for the nipple height, the first number gives the height of the left nipple, the second one that of the right one.

Of the double numbers for the ear length, the first number shows the total length of the ear, the second one the distance from the upper ear-edge to the upper edge of the hole of the ear lobe. Where only one number is found, it gives the length of the "unbeautified," naturally formed ear.

The longitudinal circumference of the head was measured sagittally, the vertical circumference transversally.

The length of the head hair was included in the table of measurements because of its relationship to the head measurements.

The head measurements of the men Nos. 9 and 10 could not be taken precisely because of the impenetrable braid coiffure.

101 144 related to the Suk-Turkana and Nandi-Lumbwa[1]. Somewhat more distantly allied to the same stock are the inhabitants of South Kavirondo or Ja-luo. These races again show close resemblances to some of the peoples who inhabit the banks of the Southern Nile, such as the Acholi, Bari, Latuka, Dinka, and Shilluk. The whole group are sometimes classed together as Nilotic, and have many peculiarities in common. Their [149] languages show a considerable, though varying, degree of affinity; physically they are tall, thin men, with features [142] which are not markedly negroid, and are sometimes almost Caucasian: several remarkable customs, such as the nudity of [516] the male sex and the habit of resting standing on one leg, are found among them all. The closest connexion seems to be between the Acholi and the Ja-luo, and between the Masai, Latuka, and Bari. The Masai, Nandi, Lumbwa, Suk, and Turkana all possess in a more or less developed form a military organization which obliges all the male population, between the ages of about seventeen and thirty, to submit to a special discipline and constitute a warrior class. A similar organization does not seem to be recorded among the tribes who dwell along the Nile[2]. These latter are not a homogeneous group, so that the word Nilotic must be used with caution. The Madi, who occupy a large portion of the country between Lake Albert and Gondokoro and extend well to the east of the river, are linguistically different from their neighbours, and apparently represent an invasion from the west, though in customs they do not seem to differ markedly from the Bari.

124 141 A glance at the map will show that from the Rift Valley to the Nile there runs in a north-westerly direction a broad belt of non-Bantu languages, more or less allied to one another, Masai, Nandi, Suk, Turkana, Karamojo, Latuka, Bari, and Dinka. The Karamojo appear to be Bantus who have been forced to accept an alien form of speech. This distribution of languages seems clearly to suggest a south-eastward movement from the country between the north of Lake Rudolf and the Nile. The hypothesis is rendered more probable by the 174 fact that in East Africa, as elsewhere, the course of invasions has been mainly from the north to the south. This is certainly

[1] The name Lumbwa is confusing. It is really a term of opprobrium applied by the Masai to agriculturalists of their own or allied race (but, apparently, to Bantus). Hence the Lumbwa are often called Lumbwa Masai. But the name is popularly and officially applied to a tribe closely allied to the Nandi who live to the south of the Kisumu railway.

[2] Some perhaps similar to something similar among the Lotuko whose young men, he says, live for fighting only.

GH 565 head than others. The most aristocratic of these clans are the Ngojé-Masai, Mellian, Lyasi, and Loitaya. These have the finest physical development, and are undoubtedly superior to the others in the shape of the head, the less depressed nose, and thinner lips. Indeed,—but for the prominence of the cheek-bones, a tendency to a Mongolian shape and upward slant of the eyes, the chocolate-coloured skin, and the hair with a tendency to become frizzy—they might pass muster as very respectable and commonplace Europeans. The Ngojé-Masai are the purest breed, and are to be found chiefly around Kilimanjaro. The most degraded tribe physically is that which is known to the coast traders by the name of Wa-kwafi. They seem to have acquired a strain of negro blood, as will be perceived by an examination of the photograph of the Masai of Lykipia (p. 201). The higher development of the Ngojé-Masai is seen in the photo of an aristocratic woman of Njiri.

634 The country is divided into about ten principal districts, such as Sigirari, Njiri, Matombaito, Kapiti, Dogilani, Lykipia, Gnar' Ngidoo, &c. The various sections of the race are generally designated by their native districts. Various clans [204] may be found occupying the same district, but they usually keep in distinct kraals. Hence they speak of the "El-Masai Matombaito," or El-Masai Kapiti. Each district also is further distinguished by having special heraldic devices on the [194] [195] shields of the warriors, painted with wonderful skill and taste in black, white, red, or yellow colours. Between the 614 various sections of the tribe there is not the slightest cohesion. 623 Were among themselves are of constant occurrence, though when a state of war is not declared, they are on the most friendly terms,—their feuds not being of that deep-seated character which distinguishes those of semi-civilized lands.

194 Of these internal wars some have been so disastrous or so 623 oft-repeated as that between the main clans of the Masai and the Wa-kwafi (I here use the name for convenience). The original home of the latter was the large district lying between Kilimanjaro, Upare, and Pare on the west, and Teita and U-sambara on the east. This large region is known to the Masai as Mbaroni. Some fifty years ago the Wa-kwafi were numerous and strong, able to hold their own against all comers. About 1830—as far as I can gather—a series of misfortunes fell upon them. In a great war-raid against the Wa-gogo to the south they suffered a severe repulse, and great numbers were slaughtered. The survi-

Gondoro fell upon them shortly after, in a raid against their brethren of *Kimaigo*. The saying that wakwaiwai never sense simply was well exemplified by their case, for nature took up the work of ruin. A cloud of locusts settled on the land, and left not a blade of grass or other green thing, so that the cattle died in numbers, and even through starvation.

[642]

GIRLS' BURNED WOOD, WOOD.

While the Wa-kwai were in this unhappy plight, the Masai of the plains to the west fell upon them and made them trip and fall, and then broke up and scattered themselves upon the most powerful division of the tribe. Great numbers having lost their cattle and been reduced to starvation, were compelled to move to their fortresses with what they had hitherto despised. Some found an asylum in the forests of Tarwia and Kalai, and the lower slopes of Mount Mara or

of bullocks. Reaching the kraal, our friend found himself among a large number of splendidly built young savages—indeed the most magnificently modelled men conceivable. And here let me for a moment pause in my story to indulge in a passing word of description.

There is, as a rule, not one of the El-moran under six feet (I am speaking of a superior class). Their appearance, however, is not suggestive of great strength, and they show little of the knotted and brawny muscle characteristic of the ideal Hercules or typical athlete. The Apollo type is the more characteristic form, presenting a roundness of outline which might be called almost effeminate. In most cases the nose is well raised and straight, frequently as good as any European's (though passing into the negro type in the lower class, such as Wakwafi). The lips also vary from the thin and well-formed down to the thick and swollen. The eyes are bright, with the sclerotic whiter than is common in Africa. The chin are generally narrow, with a Mongolian upward slant. The jaws are rarely prognathous, while the hair is a cross between the European and the negro, rarely in plies, but evenly spread over the head. Hair is scarcely in any case seen on the face or any part of the body. The cheek-bones are in all remarkably prominent, and the head narrow both above and below. The teeth and gums of almost every one are such as I have already described, though I think I have neglected to mention that the two lower middle incisors are extracted. Tattooing is not practised; but every Masai is branded with five or six marks on the thigh.

Such are the main characteristics of the El-moran; but before we resume our narrative let us note a few facts about the young damsels—the Dilei—who we seen to be flirting with our hero.

Happily facts support the verdict of gallantry when I say that they are really the best-looking girls I have ever met with in Africa. They are distinctly unlike in both manner and physique. Their figures are slender and well formed, without the abnormal development about the hips characteristic of the negro. They shave, like the men, the dark green, and the half ante of teeth. The hair is shaved off totally, leaving a shiny scalp. As to dress, they are very decent, and almost chastened, if a sticking greasy hide can have anything to do with things chastened. They wear a dressed bullock's hide from which the hair has been scraped. This is tied over the left shoulder, passing under the right

elephant is attacked at close quarters, the arrow part drives into the great beasts, and being loosely fixed in the handle, it remains when the latter is withdrawn. Another arrow is then affixed, and the same operation performed. It is said that an elephant will live a very short time after being thus stabbed, and entire herds are killed without one escaping, so dexterous and daring are these hunters. The Ambombo also use the ordinary bow and arrow, but only for the smaller game.

CHAPTER XI.

TERRITORY RAVAGED TO VICTORIA NYANZA.

The people (Wa-kwafi) of Njonga presented an interesting study to the observer as throwing light upon the origin of the various small tribes which people Africa. Unquestionably Masai in race, and only separated from that tribe through the loss of their cattle and the consequent necessity of breaking their cherished convictions by cultivating the soil, they had developed new ideas, manners, and customs in a comparatively short period.

M 101 189

They did not by any means supply an argument in favour of the vegetarians; for in personal appearance they had distinctly degenerated, and could not for a moment compete with their aristocratic cousins-in-law of Lykipia. This was especially noticeable among the women, who had lost their slender, graceful shape and acquired the ill-proportioned, unwieldy contour of the negress. Perhaps an exception might be made in favour of the young women, many of whom were well-formed and characterised by most pleasing and interesting manners.

M 189 190

The colony consisted of two villages—Njonga of Guasa Tigirish, close to our camp, and Njonga of Guasa na Nyuki. The houses were of the beehive order, with floors beneath the level of the ground, very small and badly built. They were surrounded by a double fence of thorns, which, however, are a greater source of danger than of protection, as in this dry climate they become like tinder, and consequently can be set on fire easily. If this were done at several points simultaneously, the inhabitants could easily be burned to death.

M 361

/4 cont./

174 The Semites are tall, slim figures with agreeable, finely
142 chiseled facial features, narrow, often large, but not unhandsome
noses, and small, not rarely actually pretty feet and hands.

000 Among the present-day Jews the pure Semite type is probably
not frequently represented. The Jews of Aden seem to me to
exhibit it still at its purest. On the other hand, the majority of
the present-day Jews show more or less clearly /5/ characteristic
features of the Hittite race, of whom we know that one of the
tribes affiliated with them, the Mitani, formed a mighty realm
as early as the beginning of the second millennium, the boundaries
of which extended south as far as the Lebanon, and which may
earlier have already sent ahead swarms of people to the south.
About the fate of these forerunners neither Egyptian or Assyrian
sources nor their own monuments or inscriptions give us infor-
mation, so that for the present we probably may assume that they
merged with foreign peoples -- of the Semite race -- whereby
they passed on to them their unhandsome somatic characteristics.
We know the latter in their original state only from the monuments
left to us. According to them, the Hittite type is characterized
by markedly brachycephalic heads, dark hair, dark eyes, large
hooked, fleshy noses, a markedly receding forehead, prominent
cheekbones, large bones, and, conditioned by that, a heavy
bodily build.

174 Now we find the somatic characteristics ascribed above to
142 the Semites represented neither in each Masai nor their totality
in the majority of the Masai. Rather, the latter shows the above
type in a more or less coarsened form, which, nevertheless, a
practiced eye recognizes without difficulty as Semitic and is able
to distinguish from that of the Nigrito-Semitic or Semito-Nigritic
mixed peoples and which even the novice will not take as
"Negroid."

174 May it already be said here in advance <u>that I regard the Masai</u>
121 <u>as descendants of those nomadic Semite peoples who belonged to</u>
<u>the pastoral tribes of the most ancient Hebrews.</u> I believe I have
proved this surmise in the following -- especially in the fourth
part of the present study.

Ill. 1. Masai woman from below Kibongoto.

177 That various customs of their and words of their language also found entry among the Negroes follows automatically.

619 While some travelers recognize at least a certain relationship
144 between the three branches, others claim to have observed such
142 great somatic differences between them that one might be doubtful
114 about their racial unity and ask oneself whether the Wadorobo and the Wakuafi of certain colonies should not be counted among the Negroes. This error is explained by the fact that those travelers have come into contact with them only superficially, /12/ drew conclusions going too far from isolated individuals to the generality, so that they regarded the Wakuafi, strongly mixed with Negroes, as pure, and Negroes strongly mixed with Masai blood as Wakuafi.

/12 cont./

In connection with the mosaic view of the three Masai branches, the following is to be considered. The band that immigrated last, the true Masai, have kept themselves quite pure as a race. They practically never submitted to the kidnapping of women and children in war, otherwise customary everywhere in Africa, they did not marry Negroes and did not take Negroes into their community.

Photo: H. Pfeil.

Ill. 2. Three Masai women.

Therefore they most clearly show the racial characteristics peculiar to the Masai people. The same was true of the Wakuafi until the time when they became sedentary. Then, however, they needed not only replacements for their lost cattle, but also many hands trained in the cultivation of the soil. For this reason on war expeditions they dragged off, not only the livestock of the enemy, as before, but also the women and children. The degree of mixture between Wakuafi and Negroes is very different in the individual [i.e., the Masai, Wakuafi and the Wandorobo --Analyst]

/12 cont./

Wakuli settlements. In general, naturally, the mixture is greatest where the Wakuli have already been sedentary longest, least and often scarcely /13/ noticeable or even not at all where they did not become sedentary until the last half of the nineteenth century. The cattle epidemics, which constantly brought new blood elements to the Wakuli, had a restraining effect on the mixture. In many cases one can quite accurately determine whether and what kind of foreign blood a single individual has by careful questioning about the family tree. Among the Wadamba who live far from the Negroes, in the midst of the most inhospitable bush of the steppes, for the same part probably no mixture with Negro blood has taken place, at all, against which, to be sure, each with the family, belonging to the tribally related Tonga, must be assessed with certainty on grounds of a kinetic and linguistic nature, as well as according to the tradition. Degeneration through inbreeding also seems excluded from the outset, for they constantly had as tallies of blood women and children, whose husbands and fathers had perished in the fashion following a cattle epidemic.

M
D
142
[144]

If one examines the somatic characteristics of the three blood branches from these points of view and with the elimination of all cases in which a mixture has been proved or is not excluded, one comes to the conclusion that one has before one a homogeneous race. Their characteristic traits are the following: the bodies are tall and slender. They do not, however, appear unattractively thin, but rather give the impression of elegant, flexible mobility. The thin, fine bones are surrounded by well-developed muscles, which, to be sure, stand out clearly, but, in conformity with the slenderness, not obtrusively. One sees especially beautiful forms among young girls. They are gracile, slender figures whose limbs show only just enough roundness in order to make them appear comely. Steatopyga, unlovely amplenessses one really finds only among older women. The skin color varies between deep dark-brown and light chocolate-brown. The heads are high and narrow, the oval face often has finely chiseled, attractive features and is less prognathous than among Negroes, not infrequently even orthognathous. The high, narrow forehead is well arched, the

/10 cont./

• 142 eyes are almond-shaped, straight or somewhat slanted. The nose is extended, narrow, and, at the root, flat or very moderately deep-set compared to the forehead. The alae are narrow and very flat, the nostrils resemble to longitudinally oval, less often transversely oval. The bridge of the nose is straight, sometimes slightly convex. The lips are full, without appearing actually protruding. Protruding, thick lips are something so rare and striking that they earn their owner the nickname Lehelah -- thick lip (or actually: spoon, loud mouth). The ears are small, except for the hypertrophia of the upper edge of the ear and ear lobes caused by the wearing of heavy ornaments. The hair is evenly distributed over the scalp, which is seen closely shaven on recently shaved heads. The hair often appears "tufty," but this is artifically produced. Only at a length of from one to three centimeters does it curl slightly and /10/ almost never becomes completely curly. The arms and especially the legs are very long, the wrists thin, hands and feet, especially among female individuals, small, narrow, and delicate, the fingers are slender and often strikingly long and narrow, the fingernails long, narrow, and slightly arched.

Even if the racial membership of the three branches were to be traced anthropologically, one can determine an even closer connection ethnographically, which must lead to the conviction that all three belong to the same people. The difference in their principal occupations, to be sure, seems at /11. I appear here/ first glance to indicate a sharp division. As has already been pointed out above, however, one can easily explain these differences by the consistent behavior of a people of similar customs and habits under unlike external circumstances. The predilection for stock raising, based on the exigencies for a meat diet, and the nomadic life necessarily growing out of it were common. While the Wendenbe had to endure it when their livestock fell victim to epidemics and raids of the strong Wekaeli, the latter, under pressure from the still mightier Mawi, had to flee from the open plains to fixed residences in the mountains. The Wekaeli preserved

Ill. 5. Young bloni. 5 and a pure-blooded, 6 armed with Hugo [illegible], 1 doubtful.

The Wakuri's protected

who consisted of their Gramoch by giving up their roving life, whereas the Wandendo, by sacrificing their lands, were able to continue their limited nomadic life as hunters and neither of them needed to forge the great diet.

/13/ Even though, in general, one should be very careful in ethnology about drawing conclusions from linguistic bases, it seems permissible here, on behalf of the three branches belonging to one people, to point to their language as well.

As a matter of fact, we find the same language among the bloni and Wakuri, with the exception that for the latter, with the great number of bloni dialects, sometimes this one, sometimes that one is their own, according to the location of their area, whereas the very widely ranging bloni probably understand almost all the dialects. In addition, for the Wakuri, in places, according to the degree of their mixture with Hugo tribes, a language of the latter's is more or less familiar. Of the Wandendo, the Ilgaweek speak only the language of the bloni, whereas the Ami and

/[illegible] cont./

small pens built beside or on the hut. The door opening of the hut is closed off at night by means of a goat's skin hung over it or a thorny branch dragged in halfway.

/[illegible]/ The individual huts are very close to one another. The space between two of them amounts to scarcely half a meter, so that in the evening the entire ring of huts seems closed except for the entrances. For protection against wild animals and enemies, the kraal is surrounded by a most barricade of thorny acacia branches, with which the entrances are also obstructed after the livestock has returned from pasture. In the place enclosed by the huts one finds a ring-shaped thorn-barricade in which the livestock stays during the night: large livestock, calves, and small livestock

Fig. 7. Masai hut. Plastered with cattle dung.

/[illegible]/

the ground. The father almost never carries the child on his arm, but only picks it up now and then /[illegible]/ for a moment. As soon as the child cries, even at night, the mother, or in her absence another woman, gives it the breast. If this does not help, one tries to quiet the little one or lull it to sleep by rocking it in the arms or by singing. One such familiar lullaby is the following: *ah, jejei, ndeda i, eiwuif baba ndei i ndg ne ei bisek nin* in free translation: Oh, you my little sweet, I say to you, grow and become big in my big heart.

Another song, which, like most songs, has originated during the singing and refers to recent events, runs roughly: "What does do these El molelyan want here (two women belonging to the tribe of the El molelyan were standing nearby), they who did not bring the women to childbed (that is, in this case, the woman singing the song) anything to eat? The Molelyan are fools because they are not pleased about the children. In the future the woman in childbed will have to sit down in the shade in order not to feel so hungry, or she will /[illegible]/ have to ask for food in the kraal of a warrior who brought home booty from a war against the El dorus." In the last words there is mockery insofar as the brother of one of the two El molelyan women, along with other warriors, had been recently driven back by the El

Fig. 15. Masai woman with child on her back.

/[illegible]/

The circumcision of boys is a public affair and is ordered by the gi ulimi. With the issuing of his order, the circumcision years (1 ad [illegible]) eight begin, that is, the following four to five /[illegible]/ years during which the boys may be circumcised. In all the districts the old men now hold consultations and set a definite day (3)

1. The circumcision of the boys belonging to the lineage of the El ulimbi always takes place on the 20th day of the lunar month.

for the circumcision of the five divisions of the boys in question. Similarly, later, in the following years, the circumcision days, usually only one in each year, will be determined for the following divisions of boys. It should be mentioned here, beforehand that all boys circumcised during a series of circumcision years form an age class (ai lauki) and that this age class is given a definite name by the gi ulimi. The circumcision period is ended by the gi ulimi ordering the ai gulika. This is a festival which is celebrated by the five boys in

[illegible]

1. The circumcision of the girls belonging to the El Molo always takes place on the 14th day of the Masai month.

for which they then secure an old woman experienced in circumcision. Otherwise they wait a few more weeks: perhaps a girl who is ready will will be found, since one need not necessarily wait for the aforementioned indications, or, if by chance a circumcision of the boys is about to take

[illegible]

[illegible] place, they wait until that day. Shared pain is half the pain, and a certain expense is part of good bonding among the brown tinsel monkeys too. The circumcision of boys and girls on one day takes place at different spots, and, while no female crowners may come near the boys' place, so too no men or boy may enter the hut where, in the presence of her mother, the daughter is circumcised. On the day before the latter's hand has been shaved and her hair tamed under the skin of the head. She has removed all her ornaments and has clothed herself with a long apron (cf. [illegible], cf. [illegible]), which her mother has made. The latter is now trying [illegible] to make the pain coming into question much

Im. Deng plan.

with cold water and, during this, encouraging her little daughter sitting on the ground with beating heart. The operation is a simple excision of the clitoris and is performed with a sharpened piece of sheet iron (cf. [illegible]) such as is used to shave the head. Then the small wound is washed with milk, which, together with the blood shed, seeps into the ground. A blood-stanching agent is not used here either. Until complete healing the girl remains, as [illegible] (pl. [illegible]), in the hut of her mother. Instead of the bird skin and ostrich feathers that the boys put on, she wears around her forehead a ring plaited out

G. M. Wrottesley.

561 It is to be inserted here that the girls who have been circumcised in the period from the beginning of a series of circumcision years to the beginning of the next series are counted in the age class in which the boys circumcised within the same period up to the [illegible] festival are reckoned.

/73/ As long as the members of an age class will belong to the warrior standing, those living in each area have their own head, the speaker (ni [illegible]), whom we shall meet again in the warrior
561 head. But if those belonging to one [illegible] are all married, they
634 are given a head for the entire district, the [illegible], whom not only the people of his age class, but also those of all younger age
[741] classes are obliged to obey. It is the business of the [illegible] to arrange matters so that in each district only one holds this rank. The discussions with regard to his appointment begin even before all the [illegible] members have left the warrior standing. The speakers of the district go to the [illegible] and put their request before him.

/[illegible]/

56| 70|

The exact organization of the Masai was power rests primarily on the instruction of the age classes. With circumcision the youth enters the army to perform his — the universal — military service, and, to be sure, as *el laiyuni*. His age class is that of the warriors and usually forms, together with the next higher one, that of the warriors, the protective strength of the standing army.

The next age class, the youngest of the married men, which performs no war service in peacetime, but also sets out to tissue of war, they /[illegible]/ be expected to reserve and commit to the standing army. The older age classes take up arms only to defend their own dwellers. There are two exceptions to this regular procedure. If a warrior feels still too young to leave the warrior standing along with the other *el laiyuni* warriors, he joins the next younger age class and is designated as *el gotoi* (pl. *el gotoi*) of it. This is done especially often by those who belong to the last course of an *el laiyuni* the *el ongoya*. The other instance occurs when a youth is lazy to large herds of livestock and he lacks another man to be concerned

29| 142

Ill. 36. Older men.

/70 cont./

with managing them. He must then rule over the property himself, and he marries some other circumcision. He is taken into the younger age class of the married men and designated as *ol kimwisi* (pl. *il kimwisi*) of it. In the age class of the recruits as well as in that of the warriors, these living in one district form a company 100 to 200 men strong. In order to prevent a company from becoming too large through the presence of too great a number of boys in the circumcision, which would be injurious to discipline, they have the custom of circumcision by divisions. Then a special company is formed out of one or even two annual courses, which the *ol oiboni* does by the bestowal of a special name. /70/ Otherwise every age class gets only one name or five, which is then often replaced by a new one after a successful, large war expedition or a distinction for bravery shown or, more correctly, for particularly rich spoils, but only when the men concerned have become older warriors. The *ol oiboni* gives the new name to the *ol kwiki* when it has received as *ol ponoto* he bestows the last one with the union of two *ol kwiki* into an *ol nijo*, which then bears this new name until it dies out.

The younger age class is called *ol piroto*; it is the line of no warriors whose second has not yet been formed. The next warriors consists of the younger *il kipanat* and the older *il meirarai*. The latter were called *il kipanat* as youths and were given the name *il meirarai* after a successful war against the Ukwala men. The next warriors is the *Il ainoto*, consisting of the younger *il kiwuk* and the older *il meiriko*. The former, as recruits, were called *il nyiguriko*; after a war against Ukuba, *il kipulelgio*; and after the selection of the *il meiriko*, *il kiwuk*. The *il meiriko* as youths were called *il meiriko*; after a successful war against Lolkipia as *il nyuki*, they received the name as *ilpuro*; and after the *il meiriko* selection, their present name.

Ill. 27. Very old man.

[Warrior Kraal]

/[illegible]/

Every warrior has his favorite girl (or maiden) (1).

1. /This feature has been translated from the Lozie in the original source./ Girls are yet "circumcised" live with the fighting men, sleeping with this one today, that one tomorrow. Pregnancy for a girl not yet circumcised is considered an outrage and is avoided either by interrupting cohabitation during the season and the six days following or by withdrawing the penis before ejaculation. A pregnant girl gets rid of the fetus by an abortion brought about by medicaments. In overtime priests do not have intercourse for one or two months. Separating the hymen is neither a public ceremony nor a dance rite.

As long as he is at home the lover with him, takes care of his livestock, and makes part of his ornament. The girl calls her lover *ou mulile* and shows the others the coming about of this relationship by bringing a good bottle full of milk to the warrior adjusting together and placing it beside the left leg of her lover.

Ill. 11. Warrior in war adornment.

/[illegible] cont./

[illegible] to double a conference will be conjured up by [illegible] to forward that a lion would get into the level or the camp at night or that the enemy would carry out an attack. To call someone "[illegible]" is regarded by the other Maori as a strongly insulting invective expressing contempt.

The contempt toward Maori-hostile is based on the view that the Maori-hostile are satan. God forbade human beings the doubling of blood. By carrying weapons, the chief product of the Maori-hostile among primitive peoples, they infract transgression of the divine commandments, work against the latter. Hence they are condemned by God, and therefore they are regarded by their followers as satan, abominable, bringing misfortune. Daily observation also teaches — as the Maori say — that God does not love Maori-hostile, for a Maori-hostile actually never becomes prosperous if he should happen to become wealthy. Instead, he would soon die, without being able to enjoy his property.

It should especially be brought out here that, despite all the efforts devoted to it, I have not been able to determine the slightest semantic difference between Maori-hostile and non-Maori-hostile and that all non-Maori-hostile questioned by me (there were several hundred) described the Maori-hostile as pure, untrained members of the Maori people, which the Maori-hostile themselves also maintain without exception (5).

5. Obviously the Maori Maori-hostile speak the Maori language and not neither one of their own, as had been supposed from the statement by C. Hallé in his book, The Maori, their language and history, Oxford, 1908, p. 101. Hallé says there /the question is in English/: "The rebels have their own language, which, although a corruption of Maori, is not understood by the ordinary Maori. Not all of /this language is continued on the next page in the original source/ them can speak this language; it is only a certain number of them who know it." This statement by Hallé is ex-

DISCUSSION

The ABO blood group frequencies of a large number of East African tribes have already been studied by Elsdon-Dew (1939). Readers who wish to obtain a general view of the distribution of the ABO groups in the region as a whole should consult that paper and especially charts 4 and 8. If the gene frequencies given in tables IV and XI of the present paper are interpolated in chart 4 their relationship to the rest of the region will be clearly seen as well as whether the differences from earlier data are statistically significant (on a basis of $P=0{\cdot}05$). It should be noted, however, that we find a B frequency among the Luo significantly higher than that determined by Elsdon-Dew. His figures for ABO frequencies, based on the examination of 440 persons, are, of course, to be preferred to ours—or rather, the total observations should so be accepted as giving the best frequency estimate. For the Kikuyu, on the other hand, we find a significantly higher A frequency than Elsdon-Dew. Here, again, the combined results should give the best estimate. The Masai with their high B frequency appear unique in this part of Africa. Of Africans generally their ABO frequencies most

[p.58b]

M
L
K
143

resemble those of the Ankonde of Nyasaland who possibly contain an Asiatic strain. The high B frequency of the Masai cannot be explained in a simple manner as being derived from Egypt, since the Egyptians have a very high frequency of A as well as of B.

No previous determinations have been published of A_2 frequencies in East Africa, and indeed very few from Africa at all, but it is known, mainly from observations on American Negroes, that A_2 is about as common in Africans as in Europeans. Our observations confirm this.

The MNS results support the slowly growing mass of data showing that pure Africans generally have about equal M and N frequencies, and that the gene S is much rarer than in Europe and about equally divided between the M and N genes. The scattered data will shortly be collated and discussed by Mourant (1953).

The high P frequency found among the Kikuyu is similar to that found in all African populations that have been tested. The strength of P reactions varies widely from one individual to another in all populations, but in the Kikuyu as in other African populations the average strength of the P reactions is much greater than among non-Africans.

Twenty Luo were also tested for the Kidd or Jk^a antigen. All but one were found to be positive. Thus in this population as among West Africans the frequency of this antigen is much higher than among Europeans.

The Rh results are the most difficult to interpret, and especially those of the Luo. It is quite clear that the latter have a very high frequency of the chromosome cDe and a very low one (for Africa) of cde. However, though observed and calculated phenotype

frequencies agree well, it cannot be said with certainty that all the C and E genes are, as assumed, in the respective combinations Cde and cdE; it is possible that the chromosomes CDe and cDE are present in the phenotypes CcDee and ccDEe. The Kikuyu Rh groups are easier to interpret. The chromosome cDe is still very abundant though less so than in the Luo, while cde remains rare.

The mixed series of specimens shows less extreme values for both cDe and cde than either of the pure series, suggesting that the extreme character of both of the latter series is in part an accident of sampling. Moreover, individual batches of specimens from different areas seemed to have characters of their own and, though these variations were scarcely significant statistically, it is possible that there is some heterogeneity of Rh constitution even within racial groups. Much more numerous tests must be done on both tribes before their Rh constitution can be clearly interpreted.

Taking all blood group systems into consideration, it is surprising to see how slight are the differences between the Nilotic Luo and the Eastern Bantu Kikuyu. From the present study and the results of Elsdon-Dew (1939) the tentative conclusion can be drawn that the East African native population (apart from the Masai and other Hamitic tribes) is, on the whole, fairly uniform.

Acknowledgements

000

Our thanks are due to colleagues in East Africa who facilitated the collection of the blood, and to Captain T. H. C. Allison who arranged the dispatch of several batches of specimens. We also wish to thank Miss P. J. Brooks and Miss K. E. Garner for skilled technical assistance in the numerous tests involved. The investigation was made possible by generous financial grants from the Royal Anthropological Institute and the Viking Fund, Inc., New York.

FL12 Masai FL12

PREFACE

THE Masai occupy a considerable part of the large plains which extend from about one degree north of the equator to six degrees south of it, situate in both British and German East Africa. Those living in British territory commonly call themselves Il-Maasae[1], whilst the 'German Masai' are to a large extent known as 'L-Oikop[2] or Il-Lumbwa[3]. In olden days the coast people termed them without discrimination Wa-Masái or Wa-Kwayi[4], names which have been perpetuated by Krapf and others. 101 [131]

Sir H. Johnston states[5], and probably correctly, that the Masai represent an early mixture between the Nilotic negro and the Hamite (Gala-Somali); and that this blend of peoples must have been isolated somewhere in the high mountains or plateaux which lie between the Nile and the Karamojo country. Certain it is that the Latuka, who are supposed to be descendants of the ancestral Masai, and who occupy this country, speak a language that is closely allied to the Masai tongue, and have many customs in common with the Masai. The accounts which have been published of the habits and 174 [144] [197] 114

[1] When spoken rapidly this word is sometimes pronounced Il-Mása*e* (for further particulars see also p. 29, note 4).

[2] 'L-Oikop is believed to signify the possessors of the land. It also means murder (see p. 27, note 3, and p. 311).

[3] Not to be confounded with the so-called Lumbwa (whose real name is Kip-sikisi), a tribe living near the Victoria Nyanza in British East Africa. These Lumbwa or Kip-sikisi are nearly related to the Nandi, and are believed to have migrated from north of Mount Elgon (Hobley, *Eastern Uganda*, p. 10). Lumbwa is a term of contempt, and signifies a pastoral people who have taken to agriculture.

[4] The meaning of Kwayi (*or* Kwapi) in Masai is countries *or* somewhere. Hildebrandt's suggestion (*Zeitschrift für Ethnologie*, 1878, p. 349) that Maasae is derived from the Masai word 'masaa, property, and that Kwayi is a corruption of kafi, the Swahili for paddle (given in allusion to their broad-bladed spears), is probably incorrect.

FL12 Masai FL12

INTRODUCTION

THE present work, by Mr. Hollis, Chief Secretary to the Administration of the East Africa Protectorate, treats of the language, traditions, and customs of the Masai, one of the most interesting and important tribes of those territories. I am not competent—and there must be few people in the world who are—to criticize by the light of independent knowledge the mass of material which he has brought together, and will merely attempt briefly to summarize the information about the race which we now possess. Mr. Hollis's previous contributions to anthropology, his opportunities for studying and daily conversing with the Masai, and his linguistic talents, which are well known to every one in East Africa, are a sufficient guarantee for the thoroughness and excellence of his work. 114

The Masai at present inhabit the inland districts of British and German East Africa from the equator to about 6° S. Few of them are found north of the Line, except an isolated settlement just south of Lake Rudolf, and they seem to avoid both the sea and the great central lakes. Many smaller pieces of water, such as Lakes Naivasha and Nakuru, are found in their haunts, but they neither use boats nor catch fish. They are divided at present into two sections, one of which, called 'L-Oikop, is agricultural and settled, while the other, or Masai proper, is entirely pastoral and nomadic. The difference between the two is evidently not ancient, for both speak practically the same language, and it is probable that the agriculturalists of the present time are nomads who have settled down. On the other hand, tradition does not carry the history of the tribe further back than a century at the most[1], and it would be rash to assume that the nomad pastoral state is primitive or very ancient. It is quite probable that there was a large agricultural settlement on the Uasin-Gishu plateau from which the more adventurous warriors detached themselves. 101 13 [501] [226] 101 [197] 173 174

In East Africa the Masai are clearly distinguished by their language, customs, and appearance from the Bantu races (although the latter often imitate them, and have received a certain proportion of Masai blood), and equally clearly 101 144

[1] The genealogy of the medicine men goes back about 200 years.

1: Hollis G-5 (ca. 1894-1904) 1905
FL12 Masai FL12

101 related to the Suk-Turkana and Nandi-Lumbwa[1]. Somewhat
144 more distantly allied to the same stock are the inhabitants of South Kavirondo or Ja-luo. These races again show clear resemblances to some of the peoples who inhabit the banks of the Southern Nile, such as the Acholi, Bari, Latuka, Dinka, and Shilluk. The whole group are sometimes classed together as Nilotic, and have many peculiarities in common. Their
[197] languages show a considerable, though varying, degree of affinity; physically they are tall, thin men, with features
[142] which are not markedly negroid, and are sometimes almost Caucasian: several remarkable customs, such as the nudity of
[516] the male sex and the habit of resting standing on one leg, are found among them all. The closest connexion seems to be between the Acholi and the Ja-luo, and between the Masai, Latuka, and Bari. The Masai, Nandi, Lumbwa, Suk, and Turkana all possess in a more or less developed form a military organization which obliges all the male population, between the ages of about seventeen and thirty, to submit to a special discipline and constitute a warrior class. A similar organization does not seem to be recorded among the tribes who dwell along the Nile[2]. These latter are not a homogeneous group, so that the word Nilotic must be used with caution. The Madi, who occupy a large portion of the country between Lake Albert and Gondokoro and extend well to the east of the river, are linguistically different from their neighbours, and apparently represent an invasion from the west, though in customs they do not seem to differ markedly from the Bari.

174 A glance at the map will show that from the Rift Valley to
197 the Nile there runs in a north-westerly direction a broad belt of non-Bantu languages, more or less allied to one another, Masai, Nandi, Suk, Turkana, Karamojo, Latuka, Bari, and Dinka. The Karamojo appear to be Bantus who have been forced to accept an alien form of speech. This distribution of languages seems clearly to suggest a south-eastward movement from the country between the north of Lake Rudolf and
174 the Nile. The hypothesis is rendered more probable by the fact that in East Africa as elsewhere the course of invasions has been mainly from the north to the south. This is certainly

[1] The name Lumbwa is confusing. It is really a term of opprobrium applied by the nomadic warriors to agriculturalists of their own or allied races (not, apparently, to Bantus). Hence the 'L-Oikop are often called Lumbwa Masai. But the name is popularly and officially applied to a tribe closely allied to the Nandi who live to the south of the Nyando valley.

[2] Baker perhaps alludes to something similar among the Latuka whose young men, he says, live for fighting only.

634 162 561 231 The Sighirari of the Engidongi inhabit the country in the neighbourhood of the Ngong Hills and En Doinyo Narok. To this division belong the medicine-men of the L'Aiser Gilata of whom Seggi is now the chief. The Division is estimated to possess a population of 1,900 of whom 120 are Muran, 28,000 head of cattle, 80,000 sheep and 300 donkeys. Sighirari of the Engidongi.

[563] [144] The Il Dala Lekutuk came from Laikipia in 1912 and are sometimes known as the Nyeri Masai. They have a considerable admixture of Kikuyu blood in them. They inhabit generally the neighbourhood of En Doinyo Narok and their population is estimated at 700, including some 75 Muran. They are said to possess 6,000 head of cattle, 20,000 sheep and 75 donkeys. Their Muran are divided into two "Sirits" named Il Tareto and Seure. Il Dala Lekutuk.

The Kaputiei are to be found in the neighbourhood of the Nyiri Desert. Their population is estimated at 2,600 including 175 Muran, and their possessions at 30,000 head of cattle, 100,000 sheep and 400 donkeys. Their Muran are divided into four "Sirits" whose names are Il Mokesen, Il Mejuali, Il Kidemmi and Il Sogon. Kaputiei.

The Sighirari of Laitokitok inhabit the country to the north of Kilimanjaro, which country is watered by the Engare Rongai, Kikalelwa, Naromuro, Ol ol Turesh and Rombo streams. The population of this division is estimated to number about 2,800 of whom 180 are Muran. These are divided into two "Sirits," named Il Kituli and Il Mejuali. The live-stock possessions are said to number 60,000 head of cattle, 175,000 sheep and 500 donkeys. Sighirari of Laitokitok.

563 In addition to the Masai, there are considerable numbers of Wandorobo ("Il Torobo") living in the Masai Reserve. Their numbers are probably not less than three or four thousand, and many of them possess considerable herds of cattle, and live the life of ordinary Masai, from whom it is difficult to distinguish them. They may be conveniently divided into two classes, namely, those who live in the bush and forest, and those who possess cattle. The former possess little or no live-stock, and subsist almost entirely upon wild animals and honey, while the latter live in villages and subsist only to a very limited extent on game. Wandorobo.

The former are to be found mainly in the neighbourhood of the Mau, but small parties of them are also met on the Uaso Nyiro, on the Lower Mara River, along the Sotik border, and in the Trans-Mara region. They live on tree rabbits and the smaller game animals, in rough shelters in the forests, or in the huts in some of the Masai villages.

The latter are to be found on the Uaso Nyiro, in the neighbourhood of Ol Alunga and Ol Doinyo Rasha, on the western bank of the Mara River, and in the Siria country. In all, they probably number about 1,000.

564 326 There exists in the reserve, a special tribe of smiths, somewhat similar to the Wandorobo, called Il-Kunono, who make iron weapons, but are treated as inferiors, and are not allowed to marry Masai women. Il-Kunono.

181 105 To recapitulate, the Masai are a listless, conservative, slothful people, inadequately governed by Councils of Elders, who admit themselves to be incompetent to deal with the idle body of warriors whose *raison d'etre* has now disappeared, but who are still sufficiently insubordinate to render ineffective the counsels of their seniors. They have been concentrated in one area, where they have amassed enormous herds of cattle of a poor quality, and countless sheep. No suitable means of employment has as yet been found for the males of the tribe as a whole, though they are experts in the care of stock, and once possessed fighting qualities of a savage nature, which spread the terror of their name far and wide. They have considerable latent powers of organization, alertness and ability, but these are largely discounted owing to their unreliability: they have always realized that it is in their best interests to be loyal to the British Government, and have never been responsible for any serious disturbance, being too proud to work, and rich enough to disregard fines, they are probably the most backward administered native tribe in the East Africa Protectorate. Recapitulation.

6:Thomson K-3 (1883-1884)1887
FL12 Masai FL12

exposure; for the damp cold is singularly fatal to the coast natives, who, under its influence, drop down paralyzed, apparently utterly unable to make the slightest exertion to better themselves. On these occasions you may beat them with a stick till you are tired, but they will simply put their heads between their knees like an obstinate donkey, and whine out, "Si wezi," "Si wezi" (I am not able). On my return march at Mianzi-ni, to the east of Naivasha, one of these storms came on, accompanied with thunder and lightning of appalling fury and violence. The hail fell continuously for hours, and when it ceased the country was actually *white*, and remained so all night. If we had been caught out in that storm, without huts, I question very much if ten men would have survived. As it was, so utterly paralyzed were they that even in their huts they allowed their fires to go out, and they had literally to be compelled to bestir themselves. 132

So much for Masai Land. Let us now take up the deeply interesting subject of the inhabitants.

In dealing with the manners and customs of this remarkable race, I think I shall best picture them to the reader not by describing them in catalogue fashion, but by setting forth the prominent facts in the life history of a male and female Masai, tracing their career in the various epochs of their savage existence, and trying to understand their ideas of man and nature, and their sociological relations. 128

But first of all, let me say a few words more immediately descriptive of the Masai as a race. Learned philologists profess to have discovered from a study of the Masai language—and I suppose the theory may be accepted as correct—that it belongs to the Hamitic family, as does also the language spoken by the tribes of the Nile and North Africa. This seems to be the only clue to their family relationship, and it reveals very little. The reader, therefore, will clearly understand that the Masai are in no sense negroes, or allied to the Bantu tribes with which he is so familiar from the works of our most prominent later African travellers. In their cranial development, as in their language, they are widely different from the natives of Central and South Africa, occupying in the former respect a far higher position in the scale of humanity. 197 144

The Masai tribe is divided into about twelve principal clans or sub-tribes, with numerous smaller divisions. These have not all the same position in Masai society, some clans having more "blue" blood, and being reckoned of purer 614 565

9:Fosbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

and alien children; the latter frequently come to be regarded as tribesmen by this process. 597

First of all a Masai adopts any child born to his wife by anyone other than himself, including those born prior to marriage: in fact a betrothed girl is frequently left in her father's boma until she bears a child. The child of one's own loins is called *oiunoto*, that of another *engera oilaitalak*. No distinction is made between the two, and the latter term is generally used playfully. [192]

If a man has one wife with a number of children, and another who is barren, when the former gives birth to another child, there is a ceremony by which the latter may adopt this child. The adopting mother sits on the after-birth, and pays to the true mother a cow and calf called *nongeya*. She takes over the child as her own ,and it is asserted that by stimulation of the breasts and special food, lactation can be artificially induced, even when the foster-mother has never given birth. The fact that a woman has adopted a child in this manner is seldom referred to afterwards — the child is regarded as though she herself had given birth to it.

In the olden days children were frequently captured in war and adopted into the tribe: such a child is referred to as *ol arnoti lembere*. It was, and still is, not uncommon for a Masai to adopt an alien's child; at times this will occur when the Masai marries the alien's daughter and adopts a younger son; or in time of famine amongst aliens, the Masai may find an abandoned child, or be given one to look after; or he may give some cattle to the alien for the privilege of adopting the child. The use of the word 'purchase' has been deliberately avoided, for neither party looks on the transaction in this light. A son acquired in this manner is called *atabarno*. These last two categories of adoptee can inherit the cattle of their foster-mother's house, whilst their children can inherit the 'gate' like any other Masai. 597 727 597

A peculiar custom of adoption exists amongst the Engidong or laibon's clan. Any Masai, child or adult, can attach himself to a member of the clan, and such person must treat him as a son, giving him cattle, and arranging his circumcision and/or marriage. Such a person is called *ol onito*, as also are the numerous Kikuyu received into the clan. The relationship is terminable at will, the adoptee shaving and departing, but leaving behind everything that he has been given. Though theoretically applicable to the whole clan, such adoptions usually only take place in the laibon's immediate family . 597 184

These notes on adoption are by no means full: they may, however, be sufficient to emphasise that it is a mistake to regard the Masai as being racially pure. If they come in time to accept new ideas as readily as they accept new blood, their rapid advancement would be assured. 144

It is important for a number of reasons to know who holds the purse-strings in a Masai family group, but it is a question to which no definite answer can be given. Rules, where they exist, are seldom followed — in such intimate family matters it is personality that counts. 422 593 [183]

The cattle which have been allocated to a woman in trust for her children are nominally in her control. The elder looks after the animal

THE COIFFEUR OF THE MASAI WARRIOR

By H. F. I. Elliott

302 It is surprising to find that in Hollis' standard work on the Masai there is no precise description of the head gear of the 'moran' or warrior. No doubt the fashion has been described somewhere, but some details of present day practice in Tanganyika Masailand may perhaps be put on record here.

Of all the distinctive features of the Masai, this is the one which attracts most attention from the casual traveller and invites references to 'Roman Centurions', 'Red Indians' and the like. Its advertisement value is certainly considerable and not ignored by the Masai in their conscious [186] or unconscious efforts to preserve their identity. Certainly removal of the coiffeur and its concomitant red ochre has a surprising effect in ●[144] obliterating Hamitic characteristics of feature and bringing out those derived from the now liberal admixture of 'Bantu' blood.

561 It is still so customary for youths after circumcision to adopt the traditional garb, even though they may be sons of progressive parents 302 and themselves have been to school, that there might well be an 'old 178 school pigtail' for graduates of the Masai school. It is by no means unusual to hear a pair of pig-tailed and ochred 'moran' discussing their performances in some inter-house football match of their school days, while leaning on their spears in the precincts of a cattle market.

302 There are many varieties of head gear to be found in Tanganyika, one, two, three or more pigtails, the 'ridged helmet' style, heavily plastered and loosely braided styles, but it seems to be purely a matter of fashion and not linked with clan, section, age set or even locality (except in so far as fashions naturally tend to be localised). The construction of all is basically the same and the result is covered by the single term 'Ol daika'.

The materials used in the head gear are as follows:

[824] (i) a length or lengths of pliant but straight stick one foot to fifteen inches long, cut from the tree known as 'O-siteti (*Tamarindus indica*) *L.*; the name is also applied to the shrub *Grewia* which may serve the same purpose at highland altitudes).

(ii) a strip of the inner skin of a sheep an inch wide and two or more feet in length.

[283] (iii) several feet of fine string made from ox gut or tendon.

[824] (iv) a foot or two of cord made from the 'ol-reteti' tree. This tree is, I think, correctly identified by Hollis with a species of fig, *Ficus Hochstetteri*, the cord being prepared from the aerial rootlets. But there is some doubt in the matter which perhaps a reader of this note may get an opportunity to clear up. For Battiscombe

13:Huntingford E-4 (no date) 1953 FL12 Masai FL12
Agricultural Masai

In 1932 the Il-Tiamus numbered about 2,250 (3,423 according to the 1948 Census), and though they are of Masai stock, being descended from a Sambur section called Il-Doigio, they have admitted a variety of refugees including Kamasya, and become rather mixed. According to von Höhnel they had originally four villages at the south end of Lake Baringo, but two were deserted on account of Masai and Suk raids, and some of the inhabitants, having lost all their cattle, took refuge on Kokua Island in Lake Baringo. They are expert swimmers and possess canoes, though von Höhnel saw none in 1887. Their dwellings are round huts with rather high-pitched and somewhat convex thatched roofs, and walls of posts and sticks. These are crowded into two permanent villages known as "Njemps Kubwa" and "Njemps Ndogo" in the Tigrish valley a few miles south of Lake Baringo; the closely packed huts almost touch each other, and the mud-walled granaries are surrounded by strong palisades.

In general the Il-Tiamus keep as close as they can to the dress and customs of the pastoral Masai; they have circumcision and *eunoto* and other ceremonies, and practise the "free-love" system of the pastoralists, though without the *manyatas*. Today they have some 180,000 acres of poor land, most of it unfit for cultivation; but they have acquired, since the establishment of British rule, some 12,000 or more head of cattle, and 30,000 goats and sheep, thus achieving in part the ambition of all Il-Oikop to become cattle people again. In the time of Thomson and Teleki, however, Njemps was an important station on the caravan route, and von Höhnel noted that they had a large extent of cultivated land. This was divided into blocks (he says of three to four miles square) which were intersected by irrigation channels bringing water from dams across the river Tigrish. This system was still working in Dundas's time, who says that the opening of the main ditch was performed with the sacrifice of a sheep at the mouth of the ditch.[18] Besides agriculture, the Il-Tiamus fished and hunted, using the bow, and spears of Suk and Turkana types.

It is possible that the fishing group called Il-Molo who live on the east shore of Lake Rudolf is to be classed as Il-Oikop.[19] They subsist on a diet of fish alone which, when Teleki and von Höhnel saw them in 1888, had produced no ill-effects; but it seems now to have resulted in considerable physical degeneration, and in the appearance of rickets in all members of the group. There seems to be a good deal of Gelaba blood in them.

The Il-Arusa round Mount Meru are a large tribe of agricultural Masai, originally of Bantu stock, but now accepted by the pastoral Masai as worthy of recognition as a group which can pay and receive cattle for compensation in cases of homicide. The Baraguyu in Southern Masailand are also to be classed as agricultural Masai.[20]

SOCIAL ORGANIZATION AND POLITICAL STRUCTURE

Social Organization

Life Cycle

From birth to circumcision a male is a boy, *ol-ayioni*. At circumcision[21] he enters an age-set and becomes a warrior, *ol-murani*, "one who is circumcised," and may associate with unmarried girls. At the *ol-peshe* ceremony he becomes an elder, *ol-morao*. Warriors may marry when they become senior warriors. After the *ol-peshe* the newly made elders attend to their family concerns, and get wives

[18] K. R. Dundas, *JRAI*, XL, pp. 49–53.

[19] W. S. Dyson and V. E. Fuchs, "The Elmolo," *JRAI*, 1937, LXVII, p. 337; von Höhnel, II, pp. 139–40.

[20] The people known as WaMeru in northern Tanganyika are not Masai, but people of Bantu stock who have imitated them.

[21] There is some uncertainty as to the age at which boys are circumcised. Hollis gives the limits as 13–17 years; Fosbrooke gives the lower limit as 16 or 17.

M K 196 whether, if the milk had been continued, there would have been a difference in adult stature. The results of the measurements of the Kikuyu and Masai at first sight suggests the latter alternative. But, M K although there has been a good deal of intermarriage between the [199] two tribes, they were originally of different stock, and we have no information as to whether, or to what extent the differences in stature and physique may be inherited characters. It would be an interesting study to correlate diet and stature in different countries, to ascertain whether any correlation exists between the quality of the diet and mean adult stature.

M K 169 There are differences in the incidence of disease in the two 196 tribes, and one of the tribes, the Akikuyu, show abnormalities in the K [199] composition of the blood. The diet of this tribe is very rich in carbohydrate, relatively rich in phosphorus, but deficient in calcium. Experimental data have been brought forward to lend support to the suggestion that deficiencies in the diet, abnormal composition of the blood and reduced susceptibility to certain diseases which have been noted in this tribe, may be correlated. The possibility that diet may influence the susceptibility to certain infectious diseases raises one of the most important problems in nutritional research.

M B C. 196 With regard to the bearing of the results of the investigation on conditions in Kenya, we are probably justified in concluding that the diet commonly in use amongst the Akikuyu and other tribes of similar customs is badly balanced, being too rich in carbohydrate and deficient in calcium. It is probably deficient also in other substances required as constructive material for growth, and in certain of the vitamins. On the other hand, the Masai, with a diet at the opposite extreme, possibly have too little vegetable food rich in carbohydrate and cellulose. Improvement might be brought about by increasing the use of green vegetables by both tribes, and of milk by the Akikuyu.

ccc The problem is therefore one which concerns not only medical and public health, but also agricultural authorities. A general improvement of agriculture and animal husbandry amongst the Akikuyu will almost certainly be accompanied by an improvement in the health and working capacity of the natives themselves.

This problem is not confined to Kenya. It appears to exist in many different areas in our tropical dependencies. It may be judged from the introductory statements in the early part of this report that the loss of health and efficiency attributable to deficient diet is, therefore, of considerable economic importance.

M 174 184 619 [101] [561] /8 cont./
the name El muli. Those who became sedentary, however, are designated by the Masai as El lumbua and also as El kwafi -- probably because they constitute the main part of the old El kwafi. The caravan people, accordingly, call them Wakwafi, while they make no distinction between El muli and Masai and even impose on the former the name of the latter.

M [144] In contrast to the El muli, who have remained pure, the El lumbua of all the settlements are more or less strongly mixed. In places the degree of mixture is so great that at first glance one scarcely recognizes the somatic features characteristic of the Masai people: in places, however, it is also still so slight that any mixture at all can only be determined by thorough investigation.

D 174 M 174 184 A last group[1] finally, became hunters, the El asiti. This is the second branch of the Wanderôbo: the third and most recent, the El gasurek, arose from the Masai themselves, in that those impoverished by livestock epidemics were forced to a new means of subsistence.

M 634 635 [648] Even up to 17 years ago the Masai were the lords of the vast steppes in German and British East Africa, when the European occupation brought about a change. The entire land inhabited by them is divided into three provinces. The Kisongo Province embraces those steppe regions that lie south of the line, extending east-west, connecting the peaks of Kilimandscharo and Meru. North of this lies the province of Loita, and still farther north, embracing the region of Lake Naiwascha, the province of Ol bruggo. In earlier times a part of Loita called El serenget seems /9/ to have temporarily formed a province by itself. Each province (ol oscho ?o : a province) is divided into districts (eñ gob : the land), and these again into areas. Most of their names are proper names that can not be translated; others are chosen from local peculiarities, for example, springs, brooks, hills, mountains, trees, etc. The inhabitants often name themselves after the individual M [101] provinces or districts and then speak of Kisongo-Masai, Loita-Masai, Serengeti- or even Kiteto-, Molbo-, Sogonoi-Masai, etc. M 192 101 Earlier travelers often mistakenly took this designation for tribal names. Similarly, the word ol oikob has been misinterpreted,

1. [The reference is to the last group of the original Ewafi--Analyst]

M /9 cont./
192 in that it was taken as a tribal name, and people spoke of ol oikob-
101 Masai and ol oikob-Wakuafi. El oikob (sing. ol oikobani) means killers, rough, brutal persons, and is an invective with which the Wandorobo, Wakuafi, and the Masai blacksmiths (el konono) designate their oppressors, the Masai. Fischer mistakenly translates the word as "owners of the land": this, however, would be called: ol opén l eń gob.

M The Wakuafi live in their colonies as more or less peaceful,
619 sedentary cultivators. Wherever they found peaceful neighbors after
184 their defeats, they too became calm. On the other hand, where
181 they remained in close contact with the Masai and were exposed to their constant raids, the old bellicosity remained in them. An example of this is the population of Meruberg /Mt. Meru/ in the Great Aruscha /Arusha/ and Meru areas. In spite of a very con-
M [144] siderable mixture with Wadschagga from nearby Kilimandscharo, they have completely kept their original character traits. Their
M imperiousness, rapacity, and cunning equal that of the Masai; in
[648] courage, on the other hand, they even surpass them. Their numerous attacks on the camps of Europeans and trade caravans reveal them as brigands. The relationship between Wakuafi and Masai
M is in general not bad. The latter regard the former as fellow tribes-
829 men, even though as inferior ones, because they work the soil
619 and own only a little livestock. They are foes one minute and
[241] friends the next! And both must always reconcile themselves to
[231] each other, for the Masai cannot do without them as suppliers of
[438] vegetable foods, after the rinderpest at the end of the eighties
[731] again raged so destructively among their herds.

D While among the Wakuafi one can still clearly recognize
105 their one-time power and greatness, this is no longer the case at all among the Asá. Most of them, just like the El asiti, timidly and concealed in the bush of the steppes, live in miserable little grass and leaf huts which can be reached only by hidden paths. Their food consists of game, which they kill with poisoned arrows and poisoned javelins, honey, agricultural products which they obtain in barter, various wild berries, roots, and herbs. Where they dwell in the vicinity of the Masai, they live in a certain

/10 cont./

000 superstition and belief in spirits are to be found in the grossest forms, just as all the crimes resulting from these, such as abortion, infanticide, etc., are everyday occurrences. But
648 721 even a people standing culturally higher than the Masai, with their absolutely quite low culture, would never have arrived at a dominant position peacefully living side by side. The means of attaining it were the wars waged constantly and ruth-
[177] lessly. Their daring raids greatly impressed the Negroes, which is why the latter, in order to be taken for Masai themselves and to be feared as such, adopted their attire on war expeditions.
• 144 177 The involuntary admission into these Negro tribes on the part of many Masai women and children, who often fell victim to their neighbors during the constant wars, as well as the compulsory intercourse of those who found help and refuge among the adjacent agriculturalists when the periodically recurring epidemics had carried off their livestock, created circumstances
000 that took shape in the direction of a general Masaization. To the young Negroes the free, lazy existence of the Masai warriors, devoted only to war and raids, seemed worth aspiring to, and the girls found the handsome slender Masai figures more desirable /11/ than the men of their own tribe, who, in their often hideously ugly and wild Negroishness and through the frequently total lack of care of skin and body, stand in coarse contrast to the agreeable, often finely chiseled, and handsome features and the shapely limbs of the former. Thus the Masai
144 177 gave much of their blood to other tribes, and today in almost all the peoples who have come into close contact with them one finds figures which at first glance one could take for pure Masai.

/11 cont./

142

291

Ill. 1. Masai woman from below Kibongoto.

179 That various customs of theirs and words of their language also found entry among the Negroes follows automatically.

619 While some travelers recognize at least a certain relationship
• 144 between the three branches, others claim to have observed such
142 great somatic differences between them that one might be doubtful
114 about their racial unity and ask oneself whether the Wadoróbo and the Wakuafi of certain colonies should not be counted among the Negroes. This error is explained by the fact that those travelers have come into contact with them only superficially, /12/ drew conclusions going too far from isolated individuals to the generality, so that they regarded the Wakuafi, strongly mixed with Negroes, as pure, and Negroes strongly mixed with Masai blood as Wakuafi.

/12 cont./

619 142 144 In connection with the somatic view of the three Masai branches[1] the following is to be considered. The band that immigrated last, the true Masai, have kept themselves quite pure as a race. They [727] [171] [582] [563] practically never subscribed to the kidnapping of women and children in war, otherwise customary everywhere in Africa, they did not marry Negresses and did not take Negroes into their community.

291 301 142

Fonck II phot.

Ill. 2. Three Masai women.

619 142 144 Therefore they most clearly show the racial characteristics peculiar to the Masai people. The same was true of the Wakuafi until the [178] [361] time when they became sedentary. Then, however, they needed not only replacements for their lost cattle, but also many hands trained in the cultivation of the soil. For this reason on war expe- [727] ditions they dragged off, not only the livestock of the enemy, as before, but also the women and children. The degree of mixture between Wakuafi and Negroes is very different in the individual

[1] [i.e., the Masai, Wakuafi and the Wandorobo --Analyst]

M /12 cont./
619 Wakuafi settlements. In general, naturally, the mixture is greatest
142 where the Wakuafi have already been sedentary longest, least and
• 144 often scarcely /13/ noticeable or even not at all where they did
[361] not become sedentary until the last half of the nineteenth century.
M The cattle epidemics, which constantly brought new Masai elements
[731] to the Wakuafi, had a restraining effect on the mixture. In many cases one can quite accurately determine whether and what kind of foreign blood a single individual has by careful questioning about
D the family tree. Among the Wandorobo who live far from the
144 Negroes, in the midst of the most inhospitable bush of the steppes, for the most part probably no mixture with Negro blood has taken place, at all, against which, to be sure, such with the Saoska, belonging to the tribally related Tatoga, must be assumed with certainty on grounds of a historic and linguistic nature, as well as according to the tradition. Degeneration through inbreeding also seems excluded from the outset, for they constantly had an influx of Masai women and children, whose husbands and fathers had perished in the famine following a cattle epidemic.

M If one examines the somatic characteristics of the three Masai
D branches from these points of view and with the elimination of all
142 cases in which a mixture has been proved or is not excluded, one
[144] comes to the conclusion that one has before one a homogeneous race. Their characteristic traits are the following: the bodies are tall and slender. They do not, however, appear unattractively thin, but rather give the impression of elegant, flexible mobility. The thin, fine bones are surrounded by well-developed muscles, which, to be sure, stand out clearly, but, in conformity with the slenderness, not obtrusively. One sees especially beautiful forms among young girls. They are gracile, slender figures whose limbs show only just enough roundness in order to make them appear comely. Shapeless, unlovely ampleness one really finds only among older women. The skin color varies between deep dark-brown and light chocolate-brown. The heads are high and narrow, the oval face often has finely chiseled, attractive features and is less prognathous than among Negroes, not infrequently even orthognathous. The high, narrow forehead is well arched, the

The Wakuafi protected what remained of their livestock by giving up their roving life, whereas the Wandorobo, by sacrificing their herds, were able to continue their fancied nomadic life as hunters; and neither of them needed to forgo the meat diet.

/15/ Even though, in general, one should be very careful in ethnology about drawing conclusions from linguistic bases, it seems permissible here, on behalf of the three branches' belonging to one people, to point to their language as well.

As a matter of fact, we find the same language among the Masai and Wakuafi, with the limitation that for the latter, with the great number of Masai dialects, sometimes this one, sometimes that one is their own, according to the location of their area, whereas the very widely ranging Masai probably understand almost all the dialects. In addition, for the Wakuafi, in places, according to the degree of their mixture with Negro tribes, a language of the latter's is more or less familiar. Of the Wandoróbo, the El gasurek speak only the language of the Masai, whereas the Asá and

D
197

/350 cont./

178 its effect. Hated as faithless and despised as agriculturalists, the
619 sedentary ones are constantly plagued by raids that not only cause
72 them great loss in human lives, but also take away any possibility
[829] for them to arrive at any improvement in their way of life by keeping
livestock for the attainment of the meat and milk diet so necessary
[177] for them. Moreover, the frequent intercourse with sedentary Negroes
[164] and caravan people leads to an increase in the cases of venereal
582 diseases. Premature marriages of girls, which can not happen among
178 the Masai still living as nomads, is not rare among the sedentary
184 ones and often enough leads to the death of the young woman who
165 is scarcely more than a child and whose bony structure, despite her
attained capability to conceive, is not yet developed. Finally, it
178 must still be mentioned that no doubt the longing for the formerly
182 free life in the broad steppes and the feeling of humiliation over
having become a so deeply despised cultivator of the soil oneself
[186] are factors that have a wasting effect. The latter circumstance also
brings with it a decrease of national pride. The barrier that kept
[177] Negroes out of the community of the Masai has fallen. A disadvan-
[144] tageous race mixture hurting the people is slowly taking place.
Among the Wakuafi this process was more rapid in their period. At
[648] that time no European administration prevented their raiding exped-
[721] itions in Negro regions, from which they brought home livestock
and women experienced in agriculture.

177 In frequent -- almost daily -- intercourse that soon springs up
178 and then continues to exist between the Masai who have become
sedentary and the settled Negroes, the Masai naturally also share
in the disadvantages that /351/ come to the Negroes through the
encounter of their lower culture with our higher one.

178 We have seen how many difficulties sedentation brings to the
177 Masai, and it is therefore not surprising that a part of those who
361 have already become sedentary give up their fixed residences again
after repeated failures. These then often join the Wandorobo, to
live by hunting, and call themselves this.

114 184 Consequently one must specify which Masai he is speaking of, where, and when; it is not valid to generalize about "the Masai."

History

121 Man is the ecological dominant, therefore knowledge of human history of an area is basic to understanding of its ecological history. For this reason I have gone into the history of the Masai in some detail.

174 Before 1800: The early history of the Masai has been discussed by a number of writers. Among the important works are those by Fosbrooke (1948, 1956), Gower (1948), Grant (1954, 1957), Hollis (1905), Leakey (1930), Peters (1891), Sanford (1919), Simon (1962), and Thomson (1885). The following summary is drawn from these writings.

[144] The Masai are considered to be of Nilo-Hamitic stock. It is believed that about 400 years ago they occupied a lowland country north and west of Lake Rudolph in northern Kenya. According to their own traditions they (subsequently) occupied a country called Kieru which must have been the Rift Valley between Lake Rudolph and the Kenya Highlands. This area lies about

K 146 the diet without materially affecting the amounts and proportions [128] of the protein, fat and minerals.

From this table it appears that the diet of the Kikuyu male is adequate in protein* (see discussion below p. 20), but very low in fat. It contains more than enough phosphorus but is very low in calcium and possibly low in sodium. If it be assumed that the women alternate common irio with their own dish, then their protein and fat are much as those of the men. Their phosphorus intake is also roughly similar, but their intake of calcium and sodium is much higher than that of the men. Their daily intake of calcium is over 1 gm., and must be considered to be about the optimum intake.

M 146 In contrast with this picture, the Masai diet contains a liberal supply of the mineral elements and a large excess of protein and fat, but is low in carbohydrates. It must also be low in cellulose and other indigestible residues.

(*d*) Physical Condition.

K M 128 *Measurements.*

In constructing the tables of physical measurements,† the data have been arranged in age-groups, up to and including 30 years of age. Actual ages are, of course, not known by the people themselves and, therefore, only an estimate could be made, but the factor of error will be the same with regard to both Kikuyu and Masai. The figures were arrived at as a result of questioning with reference to outstanding events.

The numbers in the different groups are given in Appendix 2 along with the detailed figures. The results are shown in convenient form in the accompanying graphs, in which they are compared with standard English measurements.

K M 141 *Height.*—A comparison of the average heights of Kikuyu and Masai males (Graph 1) of the same age, shows that the Masai grow more rapidly than the Kikuyu and reach a greater mean adult height. At their maximum about the age of 20, there is a difference of almost five inches. At the same age, Masai women (Graph 2) are three inches taller than Kikuyu women. The Masai children M 145 appear to grow more rapidly than English children. This may be 146 due to the fact that their chief article of diet is milk, since it has been shown in experiments with Scottish school children that the feeding of additional milk increases the rate of growth (Orr, 1928; Leighton and Clark, 1929). The total number of Masai children measured is, however, too small to make such deductions reliable.

K M 141 *Weight.*—Graph 3 compares the rate of increase in weight of Kikuyu children from birth to thirty months of age compared with that of English and of American infants. During the first month the Kikuyu infants are about half a pound lighter than English.

* In considering the relative adequacy of Kikuyu and Masai diets it has to be borne in mind that the biological value of the Kikuyu protein is considerably lower than that of the Masai which is derived from meat and milk.

† [See Appendix II, Category 116, pp. 77-80--Analyst]

/54 cont./

857 524 together. They build a small hut about a foot high in the customary shape, and, since they themselves cannot get into it, they place a few little stones in the doorway as their children. A pile of the aforementioned Solanum fruits represents their stock of cattle and donkeys, and another one of small stones signifies their herd of goats and sheep. Small pieces of wood represent the calabashes and other household equipment. The boy now drives the livestock to pasture, while his little wife cooks the food. Then he returns /55/ home and the two eat together. Meanwhile they decide that the pasture is no longer good and they must move on. But the Solanum "donkeys" are unable to carry the things, so they quickly tie a bast string to a piece of dry cow dung and thus make a sledge. Then everything is piled on it and the journey starts. In a few minutes the sledge is broken

857 526 and the game is over. If several boys are together, they like to play war. They divide up into two, three, or four parties of equal strength, and each builds its kraal out of twigs, in which the livestock, as previously described, finds its place. Then the parties make surprise attacks on one another, the one steals the livestock of the other, the latter pursues the victor in order to recover the booty from it, and so on, until a few blows falling too roughly end the game, and it degenerates into a little row. Small boys often go out hunting with sharpened sticks and small bows and arrows for lizards, rats, and similar animals. They are then very proud over a success, and dance, sing, and boast, as they see this done by the warriors when they come back from an expedition. In the last two or three years before circumcision a fight for a piece of meat set out as a reward for the winners represents the favorite game of the boys. Two opposing parties fight over it, armed with sticks.

• 145 Puberty sets in at about the age of 12.

701 /104 cont./
182 a little while, will then lead them farther. Otherwise they leave it
222 the rest.
[825] When the warriors of an ol boror notice that their bones are
701 getting old and the el barnot surpass them in strength, they agree
561 that it is now time to think of marriage. After they have obtained
582 the permission of the speaker and then that of the chief, one after the other leaves the warrior association, each one shortly before his
701 wedding. He announces his retirement by means of a feast, the ol
561 geteñ l ol bãã, that is, ox slaughtering with a tournament. To this
574 all the inhabitants of the nearest kraals are invited and are shown hospitality with the meat of one or several head of cattle. As soon as these are killed, each warrior cuts off a piece of meat for himself and devours it behind a bush standing somewhat apart. Then each of those present receives his share, while the remainder is strung on sticks two meters high. For these the warriors fight with the girls and women in a game in which the latter vigorously swing the sticks, before which the former has more fear than the women, somewhat
[526] accustomed to beatings. Then the younger ones amuse themselves and play, for instance, tag (tosudja). Before there is thought of de-
[539] parture, about five o'clock in the afternoon, a married man and his principal wife go to the host and make the following speech: "adjogi megur' ira ol morãni dada it' ol móruo, iñora ñ gischu inonu, ñ gera inonu, iñora naleñ, tabala 'mbaa el móran, idà tada ol móruo, tabala n dogitin bãgin el móran, ida tada ol móruo"; in translation: I say, you are no longer Ol morãni, but Ol móruo, take care of your cattle and your goats and sheep and watch over them well, leave the occupation of the warriors, now you are ol móruo, refrain from all things of the warriors, now you are ol móruo.

701 After this feast it is up to the warrior whether he takes part more
561 or less regularly in the expeditions of war. As a rule he soon marries
[582] and lives with his wife either in the father's kraal or in the warrior kraal until all his contemporaries are married. Only then are they
[591] considered ol móruo: each one builds his own kraal and removes clothing, ornaments, and braid of the warriors. He is now at the end
• [145] of the twenties, his best strength has been spent. In general the Masai, just like all members of the black race, spend their lives very quickly, they age early, without ever attaining a really advanced age.

M 10 233 (ii) *The Masai.*

The Masai are a pastoral tribe whose sole occupation is the tending of large herds of cattle, sheep and goats. It has been estimated that they have about 25 head of cattle, and twice as many sheep and goats, per head of the population.

M 262 261 [263] The staple articles of diet are meat, milk, and blood. The blood is drawn from the living animal by puncture of the jugular vein with an arrow. Various roots and barks are used to make infusions which are used either with boiled meat or with milk. The men, while in the "moran," or warrior class, subsist practically entirely on these articles of diet. The rest of the population, in addition to these four items, which form the main part of their food, eat also some bananas, beans, millet, arrowroot, maize, sugar and honey, as M [177] these are available. The use of maize, which was introduced only a few years ago, is increasing.

For the greater part of the year there is no scarcity of meat, blood and milk, but in periods of severe drought, when, in spite of the large herds, the milk supply is inadequate, the consumption of these vegetable foods is increased, and even the "moran" may be compelled to supplement their meat and milk diet.

M [484] [843] [146] Berries are eaten by the warriors when on safari, *i.e.*, on hunting or fighting expeditions. It appears also to be customary to send the pregnant women into the bush to eat berries. The berries would make an insignificant contribution to the main constituents of the diet, but it is probable that they are of considerable importance as an antiscorbutic addition.

M [184] One section of the tribe, the Loitokitok, have adopted a frankly mixed diet. It is of interest that pica among the Masai is confined to this section, who use edible earths from various sources with their vegetable foods.

(*b*) Chemical Composition of Native Foodstuffs, Edible Earths, and Mineral Waters.

Ka M K 146 The results of the chemical analysis of 153 samples of substances used in the dietary of the two tribes are given in Appendix I. Certain points of interest are discussed below.

(i) *Foodstuffs.*

In the following table a comparison is made between the analyses of the chief Kenya foodstuffs and analyses of similar products grown in other regions, probably in Europe or America, as quoted by Sherman (1926). All the figures are given as grams per 100 grams dry matter.

It appears at once that the phosphorus content of the foodstuffs is approximately the same throughout. Potassium tends to be slightly higher in the Kenya foods and is definitely higher in red millet. Chlorine is high in the Kenya leaves and red millet, and approximately the same in the other foods. Calcium is low in maize and bananas, about equal in white millet, but considerably higher in red millet and green leaves. Sodium is low throughout. The high calcium and chlorine content of the Kenya leaves is striking. Indeed, the percentage of calcium in some of the leaves is higher than that previously recorded for any natural foodstuff. Hence, any considerable addition of leaves to a diet of cereals and potatoes or plantains would tend to correct the deficiency of these foods in calcium. In this connection it is interesting to observe that a selective preference for particular leaves appears to exist. From the observations in the field and the replies to the questionnaire, it has been possible to classify the leaves analysed according as they are commonly used by men and women, by women alone, or by women in time of famine only.

It has been noted, however, that the tendency throughout the reserve is for men to eat much less of the green leaves than the women do. It is stated that in some districts they eat none. A reason given for this, in a reply to the questionnaire from one of the native chiefs, is that " . . . such food prevented them from being swift of foot if defeated in battle by the Masai."

Estimations of manganese were made in some foodstuffs (Appendix I, Table II). The level in white millet and maize was found to be similar to that found in these foods grown elsewhere, but the manganese content of Kenya green leaves was found to be very much higher than that of edible leaves in this country. The following table shows the nature of the differences found (Richards, 1930) :—

Manganese in mgms. per 100 gms. Dry Matter.

[843]
[853]

The manganese content of plant ash used as a salt substitute was also found to be very high, the values for two samples being 418 mg. and 352 mg. per 100 gms.

(ii) *Salt Substitutes and Mineral Waters.*

The ashes of water plants (Appendix I, Table IV) largely used as salt substitutes by women, especially during pregnancy and lactation, contain significant amounts of calcium and sodium. The average calcium content of seven samples, procured at native markets or in the villages, is 3·4 per cent., and the average sodium content 7·3 per cent. One of the samples analysed stands out from all the others by reason of its high calcium content, which is 10·60 per cent. as compared with values ranging from 1·0 to 1·5 per cent. for the others. This sample was bought at Wandiga's market, and the ash from this market, and that from neighbouring swamps on the Kagumo River, which is probably identical with it, appears to be more in demand than any of the others mentioned in replies to the questionnaire.

Of the 15 edible earths analysed (Appendix I, Table V), 13 were definitely richer in sodium than ordinary Kenya soils. The sodium content of these 13 earths ranges from 0·24 to 30·15 per cent. Five of these samples were from the Masai Reserve, and four of them contain high percentages of sodium. The best of these with 30·15 per cent. would form a fair substitute for Magadi soda. In the samples from the Kikuyu Reserve, the highest sodium content is 6·35 per cent.

With regard to the other inorganic constituents, only one of the 13 samples was richer in phosphorus than ordinary Kenya soil. Five of the earths are definitely richer in calcium than soil, ranging from 0·77 to 2·56 per cent. as compared with 0·75 per cent. in soil. Two of these are from an area in the Kikuyu Reserve, and it is interesting to find that they are the most sought after. The source of supply of one of them, viz., Gitirikani earth, which has a calcium content of 1·38 per cent., was at one time in the Masai country. The Kikuyu were then in the habit of making raids and fighting for this salt. They state that their cattle were fatter, bred better, and were more resistant to disease when they had a supply of Gitirikani earth. Similarly in the Masai reserve, the most popular earth is said to be that from Ol Donyorasha, and it has the highest calcium content.

K
[721]

The two edible earths which were not richer in sodium than ordinary soil contained large percentages of iron. These seem particularly popular with pregnant women. On the whole, it is probably true to say that popularity is associated with either a high content in calcium and sodium, or a high iron content.

Ka
M
K
146
312

In addition to plant ash and edible earths, the water from certain springs is held in high esteem, especially by the women, and is used in cooking. Analyses of 15 samples show a fairly high calcium content in some as compared with different waters in Britain (Appendix I, Table VIII), the highest figure being 43·60 parts per 100,000, and the average 9·83.

(iii) *Milk from the Masai Reserve.*

M
146

The analyses of 13 samples of milk from different herds of Masai cattle are averaged in the following table and compared with average figures for milk from cows at the Rowett Institute.

	Masai Milk. Per cent.	*Home Milk.* Per cent.
Total solids	13·77	12·89
Fat	5·48	3·9
Sugar	4·92	4·8
Nitrogen	·57	·54
Total ash	·73	·75
Ca	·129	·119
Na	·037	·056
K	·143	·168
P	·095	·100
Cl	·095	·111
Fe	·00008	·00009

14:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Kikuyu FL10

M
146 It will be observed that total solids and fat content are high in Masai milk. This is probably due chiefly to the low yield, since yield and fat content tend to be inversely related (Tocher, 1925).

With the exception of calcium, the percentage of the inorganic constituents is lower in Masai milk than in home milk. This is especially marked in the case of sodium. Calculated on the caloric basis the difference is still greater, and even calcium is slightly low.

(c) The Composition of the Daily Diet.

K
126 An attempt was made by Dr. Foster to collect definite data from which the average amount and composition of the food consumed daily could be estimated.

(i) *The Akikuyu.*

Observations were made on the preparation and eating of food in the native villages. The ingredients and bulk of the foods prepared, and the number of people eating them, were noted In two cases it was possible to have the food weighed for the meals of one day, and samples of the cooked mixture, or of the actual ingredients used, collected for analysis. Other attempts to make accurate observations of this kind failed owing to the belief of the natives that the handling and weighing of the food by Dr. Foster put a "spell"* upon it.

K
114
754

It will be recognised that little accurate quantitative data with regard to food consumption could be obtained under such conditions. In addition to the difficulty of getting a sufficient number of weighings or measurements, it was impossible to check incidental food consumption. The amounts of maize in the cob, of bananas, or of other foods, eaten while at work in the field or at other odd times, could not be estimated. It is necessary, therefore, to base our calculations on the samples actually weighed, taking those as representative.

K
262 The two chief meals of the Kikuyu are :—(1) A sort of thick porridge called "irio" (which means food), of which the main ingredients are maize, legumes and plantains ; and (2) gruel "ucuru" made from millet flour and water. These foods are taken with some regularity by both sexes. In addition, maize cobs, yams, sweet potatoes and plantains may also be consumed in considerable quantities, either replacing irio and ucuru when convenient, or

* It is interesting to note that this fear of the natives in the reserves of having a "spell" put upon them, through anything that was done by the investigator, presented great difficulties, not only in connection with the weighing and measuring of food, but also in the weighing and measuring of children. In the reserves, the natives are under the influence of "witch doctors," who evidently resented the practice, in their midst, of what was regarded as a new form of magic.

18:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Kikuyu FL10

It will be seen that the first three estimates are in good agreement with the actual weighings. The fourth, which is an estimate of the upper limit of food intake, probably represents a quantity well above the usual average. K 262 128

Taking all the available information together, therefore, it is believed that an estimate based on the samples actually weighed and measured forms a sufficiently accurate approximation to the daily food intake.

(ii) *The Masai.*

The assessment of the composition of the diet presents fewer difficulties in the case of the Masai. While a certain amount of differentiation exists between the sexes, it is less marked and of less importance than that between Kikuyu males and females. The following figures show the approximate amounts of the different foods taken :— M 262

Average Diet of Masai Male of Warrior Class.

Meat	1,135 grams.
Milk	2,000 c.c.
Blood	50 c.c.

Average Diet of Women and Males, not Warriors.

Meat	450 grams.
Milk	1,400 c.c.
Maize Meal	250 grams.

(iii) *Comparison of the two tribes.*

On the basis of the above dietaries, the following table has been prepared, comparing the average daily intake of the most important constituents of the diets in the two tribes. K 146

Comparison of probable Average Daily Intake (excluding incidental Food Consumption) of Dietary Constituents by Kikuyu and Masai.

	Kikuyu.			Masai.	
	Males.	Females.		Males.	Females.
		On basis of common diet.	On basis of women's irio.		
	gms.	gms.	gms.	gms.	gms.
Protein	99	140	82	300	165
Fat	22	20	8	160	90
Carbohyd	390	400	220	100	245
Ca	·28	·46	1·86	2·94	2·03
P	3·0	4·4	2·19	4·36	3·19
Na	·48	·88	1·56	1·60	·94

The above table does not take account of any incidental consumption of maize, sweet potatoes, bananas, or other similar foods, by the Kikuyu. These would increase the caloric value of K 146 128

K 146 [128] the diet without materially affecting the amounts and proportions of the protein, fat and minerals.

From this table it appears that the diet of the Kikuyu male is adequate in protein* (see discussion below p. 20), but very low in fat. It contains more than enough phosphorus but is very low in calcium and possibly low in sodium. If it be assumed that the women alternate common iria with their own dish, then their protein and fat are much as those of the men. Their phosphorus intake is also roughly similar, but their intake of calcium and sodium is much higher than that of the men. Their daily intake of calcium is over 1 gm., and must be considered to be about the optimum intake.

M 146 In contrast with this picture, the Masai diet contains a liberal supply of the mineral elements and a large excess of protein and fat, but is low in carbohydrates. It must also be low in cellulose and other indigestible residues.

(d) Physical Condition.

K M 128 *Measurements.*

In constructing the tables of physical measurements,[1] the data have been arranged in age-groups, up to and including 30 years of age. Actual ages are, of course, not known by the people themselves and, therefore, only an estimate could be made, but the factor of error will be the same with regard to both Kikuyu and Masai. The figures were arrived at as a result of questioning with reference to outstanding events.

The numbers in the different groups are given in Appendix 2 along with the detailed figures. The results are shown in convenient form in the accompanying graphs, in which they are compared with standard English measurements.

K M 141 *Height.*—A comparison of the average heights of Kikuyu and Masai males (Graph 1) of the same age, shows that the Masai grow more rapidly than the Kikuyu and reach a greater mean adult height. At their maximum about the age of 20, there is a difference of almost five inches. At the same age, Masai women (Graph 2) are three inches taller than Kikuyu women. The Masai children M 145 appear to grow more rapidly than English children. This may be 146 due to the fact that their chief article of diet is milk, since it has been shown in experiments with Scottish school children that the feeding of additional milk increases the rate of growth (Orr, 1928; Leighton and Clark, 1929). The total number of Masai children measured is, however, too small to make such deductions reliable.

K M 141 *Weight.*—Graph 3 compares the rate of increase in weight of Kikuyu children from birth to thirty months of age compared with that of English and of American infants. During the first month the Kikuyu infants are about half a pound lighter than English.

* In considering the relative adequacy of Kikuyu and Masai diets it has to be borne in mind that the biological value of the Kikuyu protein is considerably lower than that of the Masai which is derived from meat and milk.

[1] [See Appendix II, Category 116, pp. 79-80--Analysis]

K 164

child population since those with active yaws are discouraged from attending school. It is known, however, that bone deformities are produced only in the tertiary stage of the disease. Callanan (1928) noted in about 2,000 cases of yaws in children that 32·1 per cent. of male children and 21·6 per cent. of female children had the disease in the tertiary stage. Hence, even assuming that all children have yaws, and that every case of tertiary yaws involves bony deformity, it is obvious that in at least half of the 62·6 per cent. of male children, and 43·7 per cent. of female children with bone deformities, the occurrence of these deformities cannot be explained as due to yaws.

In addition to bone deformities, 40 per cent. of the boys had some obvious dental defect, 48 per cent. were clinically anæmic, and 62 per cent. suffered from spongy gums. There was also a high incidence of enlarged tonsils and cervical adenitis. The general condition was poor.

Kikuyu girls showed a lower incidence of all defects than the boys and were much superior in general condition.

M 164

The Masai village children present a very different picture, bone and dental defects and anæmia being relatively uncommon.

The results of the physical examinations are presented graphically in Graphs 7 to 10. It should be noted that, while there appears to be a correlation between diet and the incidence of bone and dental defects and anæmia, there is none between diet and the incidence of enlarged tonsils and cervical adenitis.

M [149]

K 164

Table showing percentage Incidence of different Defects in Kikuyu and Masai Children.

	Kikuyu.		Masai.	
	Boys.	Girls.	Boys.	Girls.
Bone deformities	62·6	43·7	11·7	14·6

Cervical adenitis	52·0	47·6	40·0	39·8

K M [143]

In the course of the investigation, records of cases attending native hospitals in the Kikuyu and Masai reserves were examined as to the incidence of various conditions. The data for the Kikuyu include figures from the hospitals at Kerugoya, Fort Hall, Nyeri and Githumu. Unfortunately, there is only one hospital in the Masai reserve, that at Narok, the seat of the district commissioner and a trading centre. The patients are therefore not all Masai, about 20 per cent. being Indians or natives of other tribes. We have no information as to the distribution of cases between these and Masai. The following table shows the results expressed as percentages of the number of cases analysed :—

14:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Kikuyu FL10

no marked tribal immunity to pulmonary conditions, and that any superior resistance they may show under natural conditions is probably correlated with either superior diet or environment. KM 164

It was the general impression of the field worker that disease was less common amongst the women in the Kikuyu reserve than amongst the men. This impression is supported, as far as helminthic infection is concerned, by observations by Vint (1929). In a series of post mortem examinations of 104 cases of men and women, only 19, or 18 per cent., were found free from helminthic infection. Of the 104 cases, 11 were women and 4 of them, or 36 per cent., were free from helminths. Similar evidence is found in clinical records of examinations of fæces at Nairobi Medical Laboratory in which 74 per cent. of men were found to be infected and only 49 per cent. of the women.

Tuberculosis also, as judged by hospital statistics, appears to be less common in women than in men. Wilson (1928) says " There is one noteworthy feature of all our tuberculosis statistics, and that is the overwhelming proportion of male patients," and he also states that pulmonary tuberculosis is rare in native children.

There is, of course, always the difficulty about hospital data that it may be argued that women do not go to hospital as much as the men, but even if this is true, since pulmonary conditions constitute a large proportion of all hospital cases, it seems unlikely that the proportion of women with tuberculosis going to hospital would be lower than that of men.

These indications, taken along with the marked superiority of girls over boys as described from the clinical examination of children, and the admittedly superior general condition of women as compared with men, point to an effect on general condition and health of the difference in diet of the sexes. There can be little doubt that the dietary of the young children, the girls and the women, is better balanced than that of the older boys and men, and this appears to be clearly reflected in differences in physique and health. KM 146

III.—LABORATORY AND HOSPITAL WORK.

The laboratory work was carried out by the late Dr. J. M. Henderson in conjunction with Dr. Kelly, Dr. Harvey and other members of the staff of the Medical Research Laboratory in Nairobi, which is under the direction of Dr. W. H. Kauntze. It included analyses of hospital and prison diets and metabolism experiments on native prisoners to determine the effect on weight, composition of the blood, and retention of calcium and phosphorus, of certain additions to these diets. There are no standards, based on experimental data, for the food requirements of African natives. Breinl and Young (1919–20) reviewing the existing information on dietary requirements in the tropics, conclude that "in general, the requirements in calories, either of white men or coloured natives, does not differ appreciably from European standards." Further, there is no reason to expect that there would be much difference in the relative proportions of the different constituents required. Hence, considering the analyses on the basis of European standards, the caloric value and protein intake appear to be ample. The amount of fat, however, is distinctly below 60 gms., which is regarded by several writers as the desirable amount.

We have little experimental information on the calcium and phosphorus requirements of men. Sherman and his co-workers, from the results of their experiments, consider that the minimum requirement is 0·45 gm. of calcium per man per day. To bring the

14:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Kikuyu FL10
Kenya FL1

K
M
146

calcium into line with the 100 gm. protein standard, 1 gm. would be required, and this is what Sherman (1920) states to be the desirable amount. The average daily storage for growth has been found by Sherman and Hawley (1922) to be 0·01 gm. per kg. body weight. The amount found by Herbet was 0·01 to 0·016 gm. Hence the requirement for growth in adolescent males would be about 0·5 gm. daily, giving a total requirement of from 1 to 1·5 gms. per day. The calcium content of both hospital and prison diets, amounting on an average to about 0·3 gm. per day, is obviously much below the requirement.

The phosphorus requirement as estimated by Sherman and his co-workers is about 2 gms., corresponding to 1 gm. of calcium. The phosphorus was, therefore, approximately adequate in all diets, and high in the prison diets.

It is impossible to assess in figures the vitamin content of the diets. It was considered, however, that the diets were probably inadequate in respect of vitamins A and D.

The Effect of Additions to the Diet.

Ka
146
125

As the examination of the diets had shown that they were probably inadequate in calcium and possibly also in some other inorganic constituents, and that they might also be inadequate in vitamins A and D, it was decided to test the effect of the addition of a mixture of mineral salts and cod liver oil.

Special facilities were given by the Prison authorities for carrying out metabolism experiments on the inmates of Nairobi Gaol. The actual administration of supplements and the collection of material for analysis was under the charge of Sub-Assistant Surgeon Wazir Chand of the Kenya Medical Service.

Experiment 1 : *Adults.*

As the diet was low in fat, and as it had been thought that it might be low in iodine, control observations were made with the addition to the diet of an amount of olive oil equal to the amount of cod liver oil given, and with some potassium iodide, so that, in the interpretation of the results, it would be possible to eliminate the possible effects of the added fat or the iodine in the cod liver oil.

The first experiment was made on 42 subjects who were selected from some 200 male natives serving long term sentences. They were selected as belonging to the same tribe or nearly related tribes. They were full grown, free from obvious disease and of average physique. Their occupations were comparable. The men were divided into five groups, there being 14 men in the control group and seven in each of the others. The average weight in each group was approximately the same at the commencement of the experiment.

The fæces of the 42 selected prisoners were examined for protozoal and helminthic infections with a view to having the positive cases

It is obvious that the subjects were roughly in calcium equilibrium, some showing small negative and others small positive balances. The fact that cod liver oil alone had no effect in promoting an increased calcium retention is probably due to the low calcium intake, 0·3 gm. Ca per day as compared with a probable maintenance requirement of 0·45 gm. per day. This finding is in agreement with those of Schabad and Sorochowitsch (1911) and Schloss (1914), who found that the use of cod liver oil was not always followed by an increased retention of calcium. It is also in agreement with the work of Sherman and Macleod (1925) on rats, in which they found that the addition of cod liver oil to a diet low in calcium had no effect on calcification of the bones. Ka 146

In the groups receiving the mineral mixture, the balances were usually definitely positive, and the retention was obviously highest in the mineral group receiving cod liver oil. This is in agreement with all recent knowledge of the effect of vitamin D on calcification.

Experiment 2.—*Growing Boys.*

The results of the first experiment with full grown men had shown that the addition to the calcium-poor prison diet of either calcium or cod liver oil was followed by a rise in the level of calcium in the blood, and that the addition of calcium or calcium and cod liver oil caused an increased retention of calcium. Since the calcium requirements of adolescents are higher than those of full-grown men, it was decided to carry out balance experiments with youths on this diet to determine (1) whether the calcium intake was sufficient to maintain equilibrium, and (2) the effect on the calcium balance of additions to the diet of (*a*) mineral salts, (*b*) cod liver oil, and (*c*) milk. It was thought that such experiments might give some indication of the calcium requirements of adolescents, a subject on which there is little information in the literature. Ka 146 125

For this experiment, five subjects were chosen as being reasonably comparable in age, physical development, general condition and type of prison employment. The average age of the five was 16 years. One of them was a Masai and the other four were Nandi, whose customary diet is approximately the same as that of the Masai. All were employed on gardening work in Nairobi prison where they were serving long term sentences. M N 146 125

As a preliminary, the Wassermann test was made on the five boys: all were negative. Stools were examined for parasites and blood for evidence of malaria. Similar examinations were made periodically throughout the experiment. Treatment was carried out as required and did not interfere with the experimental work.

The experiment was divided into three periods as follows:—

(1) A preliminary period of three weeks during which the subjects were on the usual long term prison diet.

(2) A period of five weeks during which the prison hospital diet replaced the prison diet.

(3) A supplement period of nine weeks in which the additions as specified below were made.

146 The basal diets were as already described (p. 20). The additions
125 were as follows :—

Prisoner's No.	*Supplement fed.*
2640	None.
2413	15 c.c. cod liver oil.
1217	Mineral mixture.
2415	Mineral mixture+15 c.c. cod liver oil.
2534	1 pint cow's milk.

The mineral mixture was identical with that used in the experiment just described. The calcium added to the ration daily in the mineral mixture was 0·68 gm. Ca. From analysis, the calcium content of the milk fed to subject 2534 averaged 0·77 gm. Ca per day. The milk was boiled, as is customary in the Colony.

Results.—(1) *Weight.*

Increases in weight occurred in each case. The largest gains were made by the boys receiving milk and minerals with cod liver oil.

(2) *Blood Calcium.*

The serum calcium was estimated in each of the boys at the beginning of the experiment. The values varied from 10 mg. to 10·6 mg. per 100 c.c. At the end of the supplement period they were practically the same. The average of all the determinations was 10·3 mg., which is within the limits of the normal European range. It is interesting to compare these figures with the previous results on adult prisoners. The latter were all Kikuyu or from tribes with a diet similar to that of the Kikuyu. The average for the 42 cases was 9·2 mg. On the other hand, the boys whose average was 10·3 mg. included one Masai and four Nandi, all with a similar dietary including large quantities of milk. Before admission therefore they would all have had a very high intake of calcium.

(3) *Calcium Balances.*

The calcium balances of each of the five subjects were determined on nine occasions, twice on the prison diet, three times on the prison hospital diet, and four times during the supplement period. The collection period in each case was 96 hours. The following table shows the balances calculated to 24 hour periods.

Average 24 Hour Balances.

Period.	2640 B.	1217 M.M.	2415 M.+C.L.O.	2534 Milk.	2413 C.L.O.

Nandi FL13

M
N
146
125

It will be seen from the table in which the calcium balances are calculated on the analyses already quoted (p. 20), namely, 0·3 gm. for the prison diet and 0·346 for the prison hospital diet, that three of the subjects were on a negative balance on both diets, and two on a positive balance on the former, and a negative balance on the latter diet. We have seen that the calcium in these diets might vary slightly owing to variations in the composition of the beans and potatoes used, but even allowing for the highest figure obtained by analysis, 0·38 gm., the subjects could not have been more than in equilibrium. In growing boys, retention of calcium would have been expected, and indeed, in a later experiment with boys, a small positive balance was found. It is possible that in this experiment, the balance may have been affected by the high calcium intake of the boys on their customary diet before admission to the prison.

Since all the subjects were on the same basal diet, the figures showing the effect of supplement feeding on the calcium balances are comparable. No. 2640 on the basal ration was practically in equilibrium throughout the three periods. The addition of the mineral mixture (No. 1217) changed an apparently negative balance of about 0·1 gm. on an average, to a positive one of 0·25 gm. In No. 2415, the addition of the mineral mixture and cod liver oil changed a negative balance of about 0·27 gm. to a positive one of about 0·1 gm. In No. 2413, the feeding of cod liver oil alone reduced the negative balance of the immediately preceding period, but as compared with the average of the two unsupplemented periods, had no beneficial effect. The greatest difference was seen in the case of No. 2534, the addition of milk changing a negative balance of 0·125 to a positive one of 0·51.

The difference in the calcium balance made by the addition of milk to the diet was therefore 0·63 gm. per day, and the amount of calcium supplied in the milk was 0·77 gm. In the case of the mineral mixture, the amount added was 0·68 gm. and the difference made in the balance was 0·35 gm. This indication of a higher availability of the calcium in milk as compared with that of calcium supplied in other forms is in accordance with the observations of Sherman and Hawley (1922), who found that in children the assimilation of calcium from milk was much higher than from vegetables. The fact that cod liver oil did not materially affect the calcium balances in this experiment would appear to indicate that, in these prison diets, the lack of calcium was of more importance than lack of the factors which affect calcium assimilation. We have already referred to similar findings by other workers.

It is of interest to consider the maintenance requirement in the light of the figures given in the table of calcium balances. The average negative balance of the five subjects throughout the two periods of unsupplemented diet was 0·116 gm. with an average intake of about 0·323 gm. If these figures be accepted as correct, the minimum requirement for equilibrium would appear to be

14:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Nandi FL13

M
N
146
125

0·44 gm. per day, which is in close agreement with Sherman's estimate of 0·45 gm.

Assuming that the maintenance requirement is 0·44 gm. per day, the addition of 0·68 gm. in the mineral mixture would leave a surplus of roughly 0·59 gm. for storage. Of that amount, 0·25 gm. was actually retained, i.e., about 40 per cent. In the case of the supplement of milk, there was a surplus of 0·68 gm., and an actual storage of 0·51 gm. or 75 per cent.

Balance Experiment 3.

The results of the second balance experiment showed that the addition to the calcium-poor basal diet of either milk or a mineral mixture resembling in composition the ash of milk was followed by increased retention of calcium. As cod liver oil without calcium had little effect on the retention, it was assumed that the chief deficiency in the diet was that of calcium itself. To verify this assumption, another experiment was made in which calcium was added to the diet in the form of calcium carbonate and bone flour, the latter supplying inorganic phosphorus as well as calcium. Both are cheap sources of calcium. Milk and green vegetables are expensive, and at certain seasons difficult to obtain, while the elaborate mineral mixture used entailed considerable work in preparation and was also expensive.

N
146
125

For this experiment five Nandi boys, of an average age of 18 years, were chosen as being comparable in physique and general condition. The preliminary treatment of the subjects and the experimental methods were as in the previous experiment.

The basal diet was the prison hospital diet. Analyses showed the calcium in a day's ration to be 0·38 gm. and the phosphorus 2·89 gm. Both were slightly higher than in the last experiment. The calcium carbonate used was a pure sample; the bone flour was a finely ground local product. The supplement feeding was arranged as follows :—

Period.	No.	Diet.
Pre-period—		
Four 2-day collections ..	—	All on prison hospital diet.
First supplement period—		
Eight 2-day collections ..	1901	$CaCO_3$.
	2251	Control.
	2413	Bone flour.
	2428	Bone flour.
	3341	$CaCO_3$.
Post Period—		
Six 2-day collections	—	All on prison hospital diet.
Graded supplement period—		
Five 2-day collections ..	1901	Bone flour.
	2251	$CaCO_3$.
	2428	$CaCO_3$.
	3341	Bone flour.

Hence the incidence of parasites in ulcer cases is not conspicuously higher than in the general population, and since in 22 per cent. of the ulcer cases the presence of intestinal parasites could not be demonstrated they cannot be regarded as an important etiological factor.

(*e*) *Tribal, sex, and seasonal incidence.*—The most outstanding feature with regard to the tribal incidence of ulcer is that brought out by the survey (p. 34), namely, the high incidence amongst the Kikuyu, and the relatively low incidence amongst the Masai. This is confirmed by the replies to the questionnaire which state that true indolent ulcer is rare amongst the Masai but common amongst the Wakamba, Kavirondo, Kikuyu, Luo and Lumbwa tribes. Ulcer is relatively uncommon also in the Swahilis. We have not sufficient evidence to enable us to say whether racial differences can be correlated with ulcer, but the prevalence of the condition throughout the tropics makes this appear unlikely. With regard to diet, the difference between the Masai and Akikuyu has already been discussed in the first section of this report, and it is known that the Swahili have a mixed dietary. The diets of the other tribes mentioned above, in which ulcer is common, are somewhat similar to that of the Akikuyu.

As regards sex incidence, of the 140 cases studied in this investigation only 3 were women. This however cannot be taken as any indication of the relative incidence in the two sexes, since a high proportion of the cases in Nairobi Hospital are derived from labour gangs. Of the replies to the questionnaire which dealt with the question of sex incidence, 5 stated that ulcer is more common among men, 2 among women, and 4 that there is no sex difference. Among the subjects weighed and measured by the field worker, there were more ulcers in adult females than in adult males, but among the children examined, ulcers were more common in the boys. In the Kikuyu Reserve at least, the women do most of the hard work and are consequently likely to be more exposed to injury than the men. On the whole, the balance of evidence seems to point to a somewhat higher incidence amongst men than amongst women.

M
K
164
196

It is interesting to note that the admissions of ulcer cases to hospital commonly increase just as the long rains break. This is a season when disease amongst cattle is said to be more frequent. Since the growth of vegetation, and consequently the diet of both cattle and natives is affected by the rainfall, the high incidence of ulcer at the end of the dry season suggests the implication of a dietary factor.

Indirect evidence in the same direction is afforded by Breinl's (1915) survey of disease in British New Guinea. He found that there was a marked regional difference in the incidence of ulcer depending on the use of sago as the staple article of diet, and the consequent frequent slight injuries from the spines on the leaves and

14:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Kikuyu FL10

000 trunk of the sago palm. Although Breinl gives no details regarding the dietary, we know from the work of Cilento (1926) and Strong (1927) that the food of the natives of New Guinea is chiefly carbohydrate, and that the general condition and health is poor. Edge also considers that dietary deficiencies play an important part in the etiology of ulcer.

M K 164 146

Such information as could be collected in the present study of the etiology of ulcer seems to warrant the tentative conclusion that neither malaria nor syphilis can be regarded as causative agents. The influence of intestinal parasitic infestation, if any, is not prominent. Trauma is probably an important exciting cause, superimposed upon a condition of low resistance, which is probably the most important factor, in as far as it decreases the natural healing powers and increases susceptibility to invasion by the characteristic micro-organisms. This condition of low resistance may possibly be correlated with dietary deficiencies.

M K 146 125 164

(iii) *Effect of Dietary Treatment on Rate of Healing.*

The effect of various additions to the diet on the rate of healing was studied in 140 cases. These were divided between two wards to facilitate the treatment. The ordinary hospital diet (p. 20) was used as the basal diet. The additions consisted of tomatoes, lemons, cod liver oil, a mineral mixture similar to that used in the prison metabolism experiments, and milk. These additions were, at one time, given all together, later the tomatoes, lemons, cod liver oil and mineral mixture were given in one ward, and milk in the other.

In addition to the dietetic treatment, the routine hospital treatment, consisting of saline baths, eusol dressings and fomentations, and, where indicated, scrapings, was continued.

The patients were weighed regularly, and daily clinical notes were taken of the general condition of the patients and the rate of healing of the ulcers. This material does not lend itself to statistical treatment. All that can be given is a descriptive account, with the conclusions reached by the observer from the mass of detailed data recorded in the course of the investigation.

In the first period, all the supplements referred to above were added to the hospital diet for one ward. This was followed by an improvement in general condition of the patients, increase in weight, and " according to the general impression " of the observer, more rapid healing of the ulcers. Later, the milk ration was withdrawn from this ward and given to the control ward, after which no detectable difference was noted in the rates of healing in the two wards. The milk appears, therefore, to have been of as much value as all the other supplements together.

The observer emphasises the fact that in no case, either with the supplements all together, or separately, was there any dramatic improvement in the rate of healing. The only conclusion possible

14:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Kikuyu FL10
Kenya FL1

M
K
146
164
125

was that the supplements improved the condition of the patients, and pari passu with this improvement there appeared to be a more rapid healing of the ulcers.

This conclusion is supported by a consideration of the gains in weight of the patients and the number of weeks required for recovery, a comparison of which affords the only quantitative measure of the effect of supplement feeding. The data are shown in the following table :—

Age.	20–22.	Over 25.	Under 16.	23–25.	17–19.
Number in group	6	23	32	11	19
Gain per man per week in oz.	13·3	12·8	10·6	8·8	8·4
Weeks to recover	8·3	10·2	10·5	11·7	12·9

It will be seen that the rate of increase in weight is not correlated with the age of the subjects.

The conclusion cannot, however, be taken as more than an indication, since it cannot be assumed that all cases were at the same stage and of the same degree of severity, and since some were discharged before healing was complete.

The dietary tests, therefore, showed that none of the substances tried had any marked effect on the rate of healing, but that the rate of healing appeared to be correlated with the general condition of the patients.

(iv) *Blood Examinations in Ulcer and Non-ulcer Cases.*

Ka
164
147
125

In order to ascertain whether ulcers could be associated with any constant deviation from the normal in the composition of the blood or in physiological adjustments, the calcium and inorganic phosphorus content of the blood were estimated, the sugar tolerance and blood pressure determined, and blood counts made in a number of ulcer and non-ulcer subjects.

(*a*) *Calcium content.*—Estimations of serum calcium were made on 90 prisoners and farm labourers not suffering from ulcers, and on 57 ulcer cases, with 13 Europeans as controls. The following figures show the ranges and averages :—

Serum Calcium—mg. per 100 *c.c.*

Class of case.	No.	Range.	Average.
Prisoners and farm labourers ..	90	7·3 to 11·0	9·4
Ulcer cases	57	7·0 to 11·2	9·7
Ulcer cases on admission	46	7·0 to 11·2	9·6
Ulcer cases on discharge	11	9·7 to 11·2	10·3
Europeans	13	10·7 to 12·5	11·2

14:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Kikuyu FL10
Kenya FL1

Ka 164 146

In the absence of further information, it can only be said that the results of this investigation suggest that susceptibility to ulcer, which appears to be general amongst natives on ill-balanced diets of the type mentioned, is correlated with a high blood inorganic phosphate, occurring with a normal, or slightly subnormal calcium, and that the actual occurrence of ulcer is associated with an exaggeration of this abnormality.

IV.—SUMMARY OF RESULTS.

M K 146 164

Preliminary observations and a review of existing information suggested that disease is more prevalent amongst native races than is generally supposed, and indicated that the incidence of certain diseases might be correlated with diet.

A survey of two tribes, the Masai and Akikuyu, showed that the diet of the former consisted to a large extent of milk, meat and raw blood, and that of the latter mainly of cereals, roots and fruits, the bulk of the diet being cereals. The outstanding points of difference in chemical composition of the two diets were that the Masai have a relatively very high intake of protein, fat and calcium, while the Kikuyu have a high intake of carbohydrate and a low one of calcium. Differences were found in the dietary customs between men and women in both tribes, the diets of the females approaching in each case to the mean between the diets of the males.

M K [262]

M K [141]

Physical measurements showed that the full-grown Masai male is on an average, 5 inches taller and 23 lb. heavier than the full-grown male Kikuyu, and his muscular strength, as determined by the dynamometer, is 50 per cent. greater. Marked differences were found in the incidence of disease in the two tribes, bony deformities, dental caries and anæmia, pulmonary conditions and tropical ulcer being much more prevalent amongst the Akikuyu. On the other hand, intestinal stasis and rheumatoid arthritis were more common amongst the Masai.

Ka [146]

Analyses showed that routine Hospital and Prison diets are markedly deficient in calcium, the average daily intake being only about 0·3 gm. Ca, as compared with the assessed requirement of about 1 gm.

K Ka 147

Examination of the blood of Kikuyu and other natives on a similar dietary showed that the concentration of calcium was lower than the European standard, the average of 90 cases, prisoners and farm labourers (not pathological) being 9·4 mg. per 100 c.c. serum, as compared with 10·0 to 10·5 mg. in Europeans at home, and 11·4 mg. in 13 Europeans in Kenya. The range of variation in blood calcium was wide, from 7·3 mg. to 11·2 mg., the highest figure being below the mean for Europeans in Kenya.

Additions of calcium salts, cod liver oil and milk made to the routine prison diets were followed by an increased retention of calcium varying from about 0·15 to 0·64 gm., the highest retention being procured in the case of calcium salts and milk. Cod liver oil had no definite effect on the calcium balances. In the adult subjects receiving additional calcium or cod liver oil in the diet, the percentage of calcium in the blood was increased. Ka 146 125

A description of tropical ulcer, as it occurs in Kenya, is given. A study of the etiology of this condition showed that its occurrence could not be correlated with the presence of syphilis or malaria, nor was there any definite correlation with intestinal parasitic infestation. Examination of the blood showed that the main difference between ulcer and non-ulcer cases was in the blood inorganic phosphorus, which was abnormally high in ulcer cases, distinctly above the level of non-ulcer cases, which themselves showed a higher level than Europeans at home or in Kenya. Thus the ulcer cases showed a marked exaggeration of a tendency common to all the natives examined. Dietetic treatment of ulcer cases gave no definite result. As the state of nutrition of the patient improved the ulcer tended to heal more quickly, but no outstanding effect could be attributed to any of the supplements tried, *e.g.*, minerals, cod liver oil, milk or tomatoes. Ka 164 Ka [147]

A short feeding experiment was arranged at a Reformatory and carried out under the supervision of the Superintendent, observations being made on the rate of increase in height and weight. A distinctly increased rate of growth was obtained by addition of maize alone, maize and bone meal, or milk, to the routine diet, the rate of increase in height being from 30 to 40 per cent. greater than in the control group on the routine diet. The feeding of bone meal with the maize caused an improvement in rate of increase (2·6 per cent.) amongst the younger boys, but none taking all the boys together. Indeed the height increase on a supplement of maize alone was greater than with added bone meal. Unfortunately, arrangements for feeding experiments with larger groups over longer periods could not be carried through. Ka 146 125

At the present stage we should not feel justified in attempting a detailed discussion of the results obtained or in attempting to draw definite conclusions therefrom. There is, however, in our view, ground for the following observations :— M K

The striking difference in physique between the Masai and Akikuyu raises the question to what extent diet can affect the stature and physique of a race. In Scottish experiments with school children it was found that the feeding of milk was followed by increased rate of growth in two successive years with the same children, but there was nothing to show whether this increase represented merely acceleration of growth with a shortening of the growth period, or 146

14:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Kikuyu FL10
Kenya FL1

M K 196 whether, if the milk had been continued, there would have been a difference in adult stature. The results of the measurements of the Kikuyu and Masai at first sight suggests the latter alternative. But, M K [199] although there has been a good deal of intermarriage between the two tribes, they were originally of different stock, and we have no information as to whether, or to what extent the differences in stature and physique may be inherited characters. It would be an interesting study to correlate diet and stature in different countries, to ascertain whether any correlation exists between the quality of the diet and mean adult stature.

M K 164 196 K [199] There are differences in the incidence of disease in the two tribes, and one of the tribes, the Akikuyu, show abnormalities in the composition of the blood. The diet of this tribe is very rich in carbohydrate, relatively rich in phosphorus, but deficient in calcium. Experimental data have been brought forward to lend support to the suggestion that deficiencies in the diet, abnormal composition of the blood and reduced susceptibility to certain diseases which have been noted in this tribe, may be correlated. The possibility that diet may influence the susceptibility to certain infectious diseases raises one of the most important problems in nutritional research.

M K 5a 196 With regard to the bearing of the results of the investigation on conditions in Kenya, we are probably justified in concluding that the diet commonly in use amongst the Akikuyu and other tribes of similar customs is badly balanced, being too rich in carbohydrate and deficient in calcium. It is probably deficient also in other substances required as constructive material for growth, and in certain of the vitamins. On the other hand, the Masai, with a diet at the opposite extreme, possibly have too little vegetable food rich in carbohydrate and cellulose. Improvement might be brought about by increasing the use of green vegetables by both tribes, and of milk by the Akikuyu.

ooo The problem is therefore one which concerns not only medical and public health, but also agricultural authorities. A general improvement of agriculture and animal husbandry amongst the Akikuyu will almost certainly be accompanied by an improvement in the health and working capacity of the natives themselves.

This problem is not confined to Kenya. It appears to exist in many different areas in our tropical dependencies. It may be judged from the introductory statements in the early part of this report that the loss of health and efficiency attributable to deficient diet is, therefore, of considerable economic importance.

CHEMICAL COMPOSITION OF FOODSTUFFS.

REPORT BY W. GODDEN.

The results are given below of the analysis of 153 samples of materials used in one form or another in the native dietary. These are classified as follows :—

	No. of samples.
Foodstuffs	83
Leaves of trees and shrubs	18
Plant ashes	8
Edible earths	16
Milks	13
Mineral waters	15

In addition, there were 17 samples of pasture and three of soil taken from the land grazed by the cows, from which the milk samples were obtained.

Foodstuffs.

In Table I the results of the analysis of the 83 samples of foodstuffs are summarised. Where a number of samples of the same substance were received, the average figures and the range are given, all percentages being expressed on the dry matter and in terms of the particular element estimated. In many cases different varieties of the same species of plant were submitted, and certain points may be noted with regard to varietal differences.

Thus, amongst the millets, the three samples of the variety, Mugimbi, submitted, were all richer in ash, calcium, potassium and chlorine, and poorer in sodium, phosphorus and nitrogen, than the average for all the millets, whilst for the three samples of the variety, Mwele, the exact reverse was found. A further difference between the two varieties is shown in the manganese content (*vide* Table II), that of Mugimbi being 40·19 mgms. per 100 gms., whereas that of Mwele is only 2·55. Mugimbi is a red millet, Mwele a white millet.

Twelve different varieties are represented in the figures for plantains, but there do not appear to be any outstanding differences in the composition of the different varieties.

The results for European potatoes cover three varieties, and those for sweet potatoes fifteen varieties. In neither case does any one variety stand out from the rest, although there is a fairly wide range of variation between the extremes. The five different varieties of yams also agree amongst themselves fairly closely.

K
146

The cooked Kikuyu foods show a fair amount of difference amongst themselves, owing to differences in the materials used for compounding them. In the case of Irio, for example, the calcium content is high as compared with all the others, probably owing to the fact that Hatha leaves are incorporated to the extent of roughly one part in eight of the mixture. Ucuru, on the other hand, which consists simply of millet flour, is one of the poorest in mineral content. Ngondi, which is a Masai food, differs from all the Kikuyu foods, in that its ingredients, namely, blood, milk and some fat, are all of animal origin. Its outstanding difference from the other cooked foods is its high nitrogen content.

As compared with the other vegetable foodstuffs, the leaves stand out as being high in nitrogen, total and soluble ash, and in calcium, and they are appreciably higher in chlorine. The incorporation of these materials in the mixed cooked foods thus tends to make up for the marked deficiency of calcium, which occurs in all of the simple foodstuffs used by the natives. These calcium figures all appear as high even when compared with the recorded data for such material as alfalfa (1·26 per cent.); red clover (1·07 per cent.) and the highest figure obtained for a highly cultivated British pasture (1·76 per cent.). Three samples of leaves stand out from the remainder, namely, Hatha leaves, and one sample of Mathoroko leaves, with a calcium content of 4·5 per cent. against an average of 2·66 per cent. for the 18 samples, and Muyuyu leaves, which are comparatively low in calcium 0·85 per cent., but exceptionally high in potassium, 10·64 per cent., against an average figure of 5·35 per cent.

Note.—Under Marura, there is one sample, namely that which was obtained at Wandiga's market, which stands out from all the others with a calcium content of 10·60 per cent. The other five are all of the order 1·0–1·5 per cent.

Two types of plant ash were submitted, namely, Mararia, the ash of a swamp reed, and Marura, the ash of a papyrus plant. The former is considerably richer than the latter in calcium, potassium, and chlorine. One of the samples of Marura ash is very much lower in both sodium and chlorine than the other five, but this is probably due to the fact that the particular sample was by no means so completely burnt as the others. Considerable variations may, therefore, be expected in this type of material, due to the conditions of ashing by the native. These materials will make up to some extent for the low calcium and sodium content of the foodstuffs, if added to them during cooking.

Itatema is a short, reedy, swamp plant and the aqueous extract used by the natives, as supplied, was "an infusion of the entire sod, including adherent earth," and contained 2·83 gs. of total solids per litre.

As might be expected from the nature of the material, the edible earths show considerable variation according to the area from which they are obtained. On the whole, the two elements which occur in the highest amount in these substances are sodium and iron. At the same time, they have a much higher percentage of calcium than phosphorus, the reverse of what the foodstuffs show. The majority of the edible earths are heavily loaded up with silica, the average percentage of ash insoluble in acid being 56 per cent. of the dry matter. Two of the edible earths, namely, that from Kimana, and the one, Ol Dugai, from a special part of the desert, south of the Manga–Laitokitok road, would make fair substitutes for Magadi soda, by virtue of their sodium content.

The Kenya milks are, on the average, richer in protein, fat and sugar than British samples, but poorer in ash and all its constituents with the exception of calcium. This poverty is accentuated if the comparison is made on the basis of 1,000 calories as supplied by the milk and then the Kenya milk shows up as deficient in calcium.

Ka [234]

Bearing in mind that the milk yield of the native cows is as a rule very low, (100–150 gallons per annum), on the basis of Dr. Tocher's figures for variation in the composition of milk, it would have been reasonable to expect the Kenya milk to be richer in fat, protein and ash than the British, but poorer in sugar. This is actually true for the fat and protein, but not for the ash and sugar. Similarly certain results, as yet unpublished, obtained at the Rowett Institute, indicate that with a low milk yield, the calcium, potassium and phosphorus percentages might be expected to be low, but the sodium and chlorine high. The results for calcium, sodium and chlorine do not agree with this expectation.

/345 cont./

182 shareholder, the rest of the shares are in the hands of his wives, who
595 acquire these shares through the birth of a son. Through this the wives, who have the duty to tend and care for the livestock, are interested in the preservation of the property in the most extensive way. This is the one factor of the polygamy of the Masai promoting prosperity with all its advantages for the political economy. The other lies in the fact that many women give birth to more sons for one man than one woman could. Here, however, male offspring are augmenters of the paternal property. The boy grows up to become a warrior and brings his family the spoils of the numerous raids, through which not only is the herd increased, but, through the supply of new blood, is also improved.

Polygamy among the Masai is therefore a natural institution. Without it large masses of women would be deprived of their natural occupation, a condition that seems impossible for a primitive people. It is, moreover, a source of prosperity, which, among a culture-poor nomadic people, can only make itself felt favorably for their preser-
[146] vation as a people. From it follows, first of all, good nutrition, which makes the body resistant to the effects of illnesses. It corre-
[165] sponds to my observations that among the Masai in general, among
[164] adults, fewer cases of death occur as a consequence of illness than is the case among the Negroes living in their vicinity. Also, serious illnesses are more infrequent among them than among the former
182 and are milder in their course. The circumstance that abortion is
847 practiced by the women in only very rare exceptional cases also undoubtedly acts to promote health. One can sufficiently observe the harm that this bad custom has often caused primitive peoples among the various neighbors of the Masai, though indeed there are also exceptions to this. Thus, I met a number of Dschagga women who went through this operation four to six times and allegedly, as well as apparently, without harm.

182 In contrast to the high fertility there is also a rather high child
165 mortality, though infanticide is entirely unknown. It is definitely
854 beneficial for the child that through work the mother is not kept
[847] outside the kraal, but can always remain in the vicinity of the child.
[853] The long nursing period of about two years is also advantageous.

/345 cont./

182 Harmful to the child's health, on the other hand, are the poor huts,
165 which are always /346/ filled with dense smoke, and furthermore
854 the lack of cleanliness and the faulty diet. The belief, widespread
[362] among all African primitive peoples, that fat gives strength and
[853] health leads to the stuffing of the baby, despite all its struggles and
• [146] screams, with unbelievable quantities of butter. Soor, as well as
[856] stomach and intestinal affections, and ailments of the respiratory
[164] organs are therefore also the principal illnesses that carry off the babies. If one compares the high mortality among children with the very low one in later life, and if one further considers that, in inspecting the Masai kraals, one finds almost only healthy people full of energy, one cannot resist the thought that the treatment of the children, especially the babies, unconsciously aims at culling out all the weak elements at an early age and preserving for the people only the most vigorous ones that are equal to the demands of life. Seen from this standpoint, that of natural selection, the high child mortality seems less unfortunate. Finally, the late age
182 at which the men enter their first marriage is unfavorable for popu-
582 lation increase. Until about the 28th or 30th year of life the Masai
836 belongs to the warrior standing, and he may marry only after leaving
837 it. This circumstance in turn makes free love, such as exists in the warrior kraals, an understandable social institution. One must judge this arrangement on the soil in which it grows, in order to remain objective. From the same standpoint we shall have to judge more leniently the free love existing among the married, which, despite numerous restrictions, appears to us like a continuous prostitution
[548] of the woman. One can do this all the more since through that professional prostitution is excluded here, and consequently the possibility of infection is greatly reduced; this last circumstance is undoubtedly to be regarded as people-preserving. Actually the Masai
[164] maintain that in former times (before the great livestock epidemics) venereal diseases only very rarely occurred. Immorality is rightly
182 regarded as a people-destroying factor, and history teaches us by
831 many examples how licentious and refined sensuality was one of the grounds that caused the decline of higher peoples. Here among the Masai, however, it is not a matter of this unnatural kind of

/395 cont./

142 Thin. Tonus of the soft parts firm. Skin color: forehead and chest dark-gray--reddish-brown (between 28 and 29); cheek somewhat darker (28); back of hand and scrotum black-reddish-brown (27); nipples somewhat lighter (between 27 and 28). Color of the iris: black-brown with bluish edge. Palpebral fissure set somewhat obliquely, wide-slit. Head hair an inch long, curly. Head, from the crown view, rounded, egg-shaped, with narrow front end, moderately rounded at the occiput. Crown is arched and lies toward the back. Sinciput high, occiput more strongly arched ost. Face round to broad-oval. Profile almost orthognathous. Chin vertical. Hair edging of the forehead almost symmetrically curved from ear to ear. Forehead high, steep, full-arched. Nose medium-sized, high, broad. Root of nose moderately deepened toward forehead; bridge straight, tip blunt and directed straight out; nostrils oblique-oval; alae rather flat, their lower edge curved upward. Lips moderately thick. The two middle lower incisors have been pried out. The corresponding upper ones are set somewhat obliquely forward; between them is /396/ a gap 3 mm. wide. The teeth are large, the front ones long and narrow. Both ear-lobes considerably stretched; the upper auricle-edges each pierced once. Foot medium-arched. Second toe juts out. Hand medium slender. Nails large, long. Legs sturdy, some-
• [146] what bent inward; slight rachitic curvature on the shanks.

No. 14.

Saitó, ♂, about 27 years old, a native of Sogonoi; ol muli. Lineage: El mamasita.

Medium fat. Tonus of the soft parts firm. Skin color: forehead and cheek dark-gray--reddish-brown (between 28 and 29); chest somewhat darker (28); back of hand and scrotum black-reddish-brown (27); nipples lighter (between 27 and 28); palm of hand

231 272 When they have enough blood, the thong is released and the small wound covered with mud or dung, and the animal runs off apparently none the worse for wear. The blood is drunk warm, or mixed with milk.

• 146 Although they are thin, the Masai appear adequately nourished, and they have great physical endurance. The Ministry of Health doctors told us that Masailand was the only part of East Africa in their experience where the children did not show signs of Kwashiorkor or the other diseases of malnutition that are so common with Africans. Gale (1960) noted that the greatest defect in the diet of the East Africans is lack of animal protein, but this is true of the Masai only in times of extreme drought.

291 [386] <u>Clothing, Jewelry and Utensils</u> The traditional clothing of Masai men and women is an ochre colored cloak of cloth, usually gathered over one shoulder. Some wear (292) skins, usually of sheep. A cow hide is used for a rain coat. Most Masai men wear sandals made from heavy leather or old rubber automobile tires. Very little else is worn by either Masai men or women, except near missions where the women occasionally wear more concealing cloaks.

With regard to the potentialities of the Masai as a tribe, it must be borne in mind that the total population of the Masai in the Masai Reserve numbers no more than 42,000. Of these, it may be assumed that about 20,000 are males of all ages, while some 4,000 are Morans. Taking the proportion normally maintained among other native tribes, for which more accurate statistics are obtainable, it is found that approximately 10,000 males are boys under the age of the Moran class, while the remaining 5,500 are elders. It will thus be seen that the tribe under consideration is relatively small in regard to population, and that, therefore, specialisation will be necessary if the attributes of the tribe are to be utilised to their fullest capacity. Population 162

Sufficient has already been said of the conservatism and clannishness which are the dominating characteristics of the Masai. The state of idleness in which both young and old live has proved a barrier to progress which has resisted all efforts made in the past to introduce development on civilised lines. The only measure which has attained to any degree of success in the establishment of trading centres, where a carefully controlled trade has opened the eyes of the Masai to a small extent to the advantages of imported articles, and has created some desire on their part to invest a proportion of their enormous capital in trade goods. Even so, it appears that they have not been induced to desire anything more progressive than flour, sugar, and honey in the way of food, and such imported articles as umbrellas, blankets, cotton shooting, knives, axes, and cooking pots. They are still in a most primitive state. Conservatism 181

The semi-military organisation which has been handed down by their ancestors is still preserved, and continues to act as a deterrent to any innovation. Now that raids are ended, the Morans have nothing to occupy their attention, and it is this fact that has rendered it necessary to consider the possibilities of developing them into useful citizens along a definite line of policy, rather than to adopt merely normal administrative measures, which has been so successful among the other tribes of the Protectorate. Of their own free will, the Masai will do nothing except fight with the weapons they know, and the young men of between sixteen and twenty-five years of age have now no occupation of any description. It is on behalf of these youths, the Morans, that the first steps in the necessary policy must be taken. Employment for the Morans 175 46 27

It is known that, by their training from their earliest years, the Morans are experts in the handling of stock. Each boy has been accompanied by herd hundreds of head of cattle since the days when he started to walk, and there is probably no other nation in the world that can boast such a measure of success in this branch of knowledge. But, after circumcision and the assumption of the status of warrior, the youth leaves the care of stock to younger boys, and his ability in this direction is thereby wasted. Occupation 464 27

It is said that about fifteen per cent. of the Masai of the Morans class are employed by various farmers in herding cattle, but, even to this extent, the value of their services is largely discounted by the aversion which they show to the performance of work which they consider to be derogatory to their dignity, and the limits of what is not undignified are very materially reduced. Manual labour of any kind is regarded as objectionable, and the Masai are physically incapable of carrying loads. But, if they are given a wage high enough to satisfy their wants, if they are consididerately treated, and if they regard the chiefs of their employer's land as suitable, they cannot be improved upon as cattle herds. The Morans [341] [149]

In normal times, the number of settlers in the Protectorate who would make use of this class of labour is not large, and the demand for public purposes is smaller still, while the utility of the Masai as a whole in this connection is greatly diminished by their dislike of working for a European whom they do not know, and by the weakness of their constitution, which renders them suitable for work in a restricted area only. In order to make the Masai suitable for general employment even as cattle herds, therefore, it is necessary either to allow their conception of their dignity to be so to make their services of more general application, or else to insist on their performing for a smaller remuneration the work that they will consent to do. Demand for such labour

K
M
944

This is in agreement with observations on the birth-weight of Kikuyu children by Anderson, G. V. (1928). The rate of increase in weight is roughly similar for the first ten months, but thereafter the Kikuyu increase much more slowly than English or American and are about 8 lbs. lighter at 30 months. We have no data regarding the birth-weight or rate of increase of Masai infants.

In Graph 4 the weights of Kikuyu and Masai males are compared with English standards. The Masai male is uniformly heavier than the Kikuyu, but lighter than the English. The difference between Masai and Kikuyu becomes more marked after the age of 15 years, and at the age of 20 the Masai average 23 lbs. more. The difference between Masai and Kikuyu females (Graph 5) is even greater, the Masai approximating to the English standards. The average weight of Masai women in the 21-25 age group is 27 lbs. above that of Kikuyu women. It is noteworthy that Masai of both sexes show, on the average, a decrease in both height and weight after the 25th year. A similar decrease occurs in the Kikuyu, but not until the next quinquennium. Early senility appears to be common to both tribes.

In addition to being superior in height and weight, the Masai are typically larger in the chest and smaller in the abdomen than the Kikuyu. (Appendix II, Tables V and VI.)

K
M
149
141

Strength.—Average dynamometer readings at different ages are compared in Graph 6. From the earliest age the Masai give evidence of superior strength. At the maximum the males achieve an average hand pressure of 99·6 lbs., which is 20 lbs. more than the maximum for Kikuyu males. The Kikuyu male shows a strength which, indeed, is just equal to that of the Masai women, and is only at the maximum about 10 lbs. greater than that of Kikuyu women. This evidence of inferior strength on the part of the Kikuyu, especially the male Kikuyu, is supported by what we know regarding his very low capacity for work and power of endurance. Unfortunately, we have no information as to capacity for work in the Masai.

(v) Clinical Observations—Incidence of Disease.

K
142

Signs of malnutrition and symptoms suggestive of rickets are common among Kikuyu children, the males particularly being affected. Few cases of early rickets at the typical age came to the field worker's notice, but signs of late rickets were commonly observed in this tribe. Thus, of 1,225 boys examined, 830 (68 per cent.) had some osseous deformity such as genu valgum, genu varum, flat foot, scoliosis, beading of the costochondral junctions, rickety rosary, or cranial bossing.

K
169

It is known that yaws produce bone deformities of many kinds, and it is, therefore, important to know what part of the above deformities may be attributable to yaws. There are no reliable figures showing the general incidence of yaws in children. Philip (1927, 1) gives the incidence amongst school children in one district as about 15 per cent., but this figure is not applicable to the general

14:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Kikuyu FL10

of blood for phosphorus determinations, 15 gm. urea being given in each case :— Ka 164 147 125

Urea Concentration Tests.

Inorganic P.		Hours after administration of urea.			
		1.		2.	
Ulcer case.	Mg. per 100 c.c.	Urine vol.	Urea.	Urine vol.	Urea.
		c.c.	%	c.c.	%
1	4·17	310	0·88	130	2·54
2	4·72	300	1·16	90	3·00
3	4·66	165	1·66	72	4·00
4	5·00	115	2·06	70	4·37
5	6·02	410	0·78	80	3·00

It will be observed that the concentration of urea is within normal limits, being in all cases over 2·0 per cent. in the second hour (the accepted standard, Maclean, 1924). Hence the very high blood inorganic phosphorus in ulcer cases cannot be attributed to renal insufficiency. The general fact of an increase is, however, in agreement with what we have seen to occur with diets ill balanced in having an excess of phosphorus and deficiency of calcium.

(c) *Sugar tolerance.*—In 34 subjects, of whom 16 were ulcer cases, the sugar tolerance was investigated. Tests were also made on three Europeans as a control against the possible effect of climatic conditions.

The detailed results are given in Appendix 3. *Graph* 11 shows the nature of the results obtained. It will be seen that the Europeans conform fairly closely to the standard curve. The natives, on the other hand, show a distinct lag. This is in agreement with tests on Indians by Bhatia and Coelho (1928), who found that those accustomed to a vegetarian diet, chiefly carbohydrate, showed a lag in the rate of return to normal after ingestion of glucose. There is little difference between the curves for ulcer and non-ulcer cases.

(d) *Blood pH and alkali reserve.*—It was intended to investigate the pH and alkali reserve of the blood but, owing to delay in the transit of apparatus, the work had just begun when Dr. Henderson became ill. The only available data are a few preliminary observations on the pH, which showed no marked deviation from the normal. Ka. M K

(e) *Blood-pressure.*—Blood-pressure estimations were made on a number of Kikuyu, both on indoor and outdoor work, and on ulcer cases. With these were compared estimations on natives belonging 147 125 164

125
164

to other similar tribes, on Masai and on Europeans. The following table summarises the results :—

Blood-pressure—mm.

Tribe.	Kikuyu in-doors	Kikuyu out-doors	Kikuyu all	Others in-doors	Others out-doors	Others all	Masai	Euro-peans	Ulcer cases
Number	40	14	54	31	15	46	28	16	31
Average age	29	28	28	34	32	27	28	29	19
Systolic	110	119	112	111	123	115	117	118	98
Diastolic	76	82	77	79	87	82	79	75	64
Pulse P.	34	37	35	31	36	33	38	41	33
Weight, lbs.	127	130	128	132	136	138	133	—	—

The figures for Europeans correspond fairly closely with the normal standard, with a tendency to be slightly low. This is in agreement with other observations (Breinl and Young, 1919-20: Roddis and Cooper, 1928: Fleming, 1924). The ulcer cases are definitely lower than non-ulcer, and statistical analysis showed the difference to be significant. There is, however, a difference in average age between the two classes, which may account for at least part of the difference in blood pressure. Analysis of the data shows that there is little difference between ulcer cases over 20 years of age and those under 20, the former giving an average of 99 mm. and the latter 96. It is probable, therefore, on the whole that blood pressure may tend to be low in ulcer cases. It is most likely that this depends not so much on the ulcer *per se*, as on the lowered vitality and restricted activity of the patients.

Ka
147
125

(*f*) *Blood cell counts.*—Cell counts were made on 28 ulcer cases with 21 non-ulcer cases and eight Europeans as controls. The results were as follows :—

	Europeans.	Non-ulcer natives.	Ulcer cases.
Leucocytes	10,725	9,580	11,979
Erythrocytes	5,835,000	5,590,000	5,667,000
Hæmoglobin	91·5%	86·0%	81·2%
Colour index	0·95	0·92	0·85
Polymorphs	64·5	47·0	41·0
Lymphocytes	27·5	41·0	45·0
Large mononuclears	4·2	4·2	7·1
Eosinophiles	4·0	7·1	5·1

There was a lymphocytosis in all natives, ulcer and non-ulcer cases. In ulcer cases the hæmoglobin was somewhat low, but the difference is probably not significant. A diminution in polymorphs and increase in eosinophiles has been observed by others in Europeans in the tropics (Breinl and Young, 1919-20).

(v) *Conclusions.*

In all these blood examinations, the only outstanding point of difference between ulcer and non-ulcer cases is the high inorganic phosphorus in the blood in ulcer. It is of interest to consider the calcium and inorganic phosphorus results together :—

	Serum calcium, mg. per 100 c.c.	*Inorganic phosphorus, mg. per 100 c.c.*
European standards ..	10·0 to 10·5	.. 3
Europeans in Kenya ..	11·4	.. 3·43
Non-ulcer natives ..	9·4	.. 3·68
Ulcer cases	9·7	.. 4·55

It appears very unlikely that the alteration in balance of calcium and phosphorus in the blood of the natives should be in any way due to environmental influences, since both elements are increased in approximately the same proportion in Europeans. We have already seen that a shift in the direction of high phosphorus, low calcium, occurs in experimental animals on diets containing an excess of phosphorus and deficient in calcium, and the lack of balance in the native dietary, which is closely similar to these experimental diets, would suffice to explain a high phosphorus and low calcium content in the blood. It does not, however, explain the difference between ulcer and non-ulcer cases, for the ulcer cases are so much higher in inorganic phosphate than the non-ulcer that their calcium would be expected to be significantly lower. Instead of being lower, it is at least as high.

It would be of great interest to know whether in the individual case a rise in calcium or phosphorus occurs subsequently to the development of ulcer, and also whether any change occurs in the form in which calcium is present in the blood. It has been suggested by Greenwald and Gross (1925) that part of the calcium may normally be held in solution in the blood as calcium phosphate, which would be physiologically inert. An increase in this fraction might be thought to occur. Further, Ashford and Hernandez (1926), in analyses of the blood of over 500 subjects in Porto Rico, report that blood calcium is low, relatively to accepted standards, especially in cases of "nutritional unbalance," and that the decrease is chiefly in the diffusible fraction.

Ka
164
146

It is stated that tropical ulcer cannot be produced by experimental inoculation of the characteristic organisms unless an artificial necrosis of the skin is first produced. (Blanchard, 1914; Breiel, 1915.) It does not occur in Europeans, according to Edge (1921), except where the diet is restricted. It would be of the greatest interest to know whether it could be experimentally produced by inoculation of the organisms into animals in which the composition of the blood had first been altered by feeding an ill-balanced, high phosphorus, low calcium diet.

KM 1946 (41)

/103 cont./

619 After a battle of the Masai among themselves, the conclusion of
728 peace is that the speakers, in the presence of a number of warriors of both parties, exchange their skin capes and sandal thongs. This is called etabaschage megitin = exchange of skin capes.

726 The length of the stretches covered on war expeditions, in com-
701 parison to that of their neighbors carrying on agriculture, is often
484 astonishing. Performances of 60 to 80 kilometers a day for three or four days in succession, are by no means exceptions. [illegible] considers,
[702] however, that the training of warriors consist[illegible] marching, that,
[276] aside from their weapons, they carry nothi[illegible], and before their marches, as well as during them, they partak[illegible] copiously of stimulants, their performances in no way exceed those of a German infantry
701 troop. The tales of the caravan people relate miraculous things about
182 the speed and endurance of the Masai warriors, and even European
147 travelers have contributed to the spread of this legend in that they
271 compare the physical performances of the Masai with those of the Europeans in the tropics. The untenableness of such a comparison is obvious. One also often hears how the Masai are admired for their alleged ability to be able to give up the drinking of water on their marches. Presumably this rumor arose from the fact that these people, in contrast to other tribes, never carry a gourd bottle of water on their
701 long migrations. The Masai, however, knows perfectly every little
182 spot of the steppes, he knows every rocky basin, every tiny spring,
271 he also knows where an apparently dry brook bed carries subterranean
[823] water. Where water has collected in old hollow trees, and especially in baobabs, this is accessible to him through a series of steps made
[824] out of foot-long taps bored in horizontally. Finally, there are a number of water-rich roots and tubers, which, chewed, are very well suited
701 by their water content to quench thirst. They serve him, /104/ just as
182 the wild honey, not infrequent in the steppes, also serves as food on the
222 march. A cuckoo bird, the honey indicator (Cuculus indicator, called
[825] eñ johoroi by the Masai), leads the Masai to the concealed honey holes.
036 As soon as it sees human beings it calls with a strident sound and then flies slowly to the nearest honey place, to which the people follow it
[825] in order to take out the honey. If the amount found is still not sufficient for the warriors, they bury the chewed comb, whereupon the bird, after

/121 cont./

181 If we summarize the traits outlined above, there results, on the one hand, the fact that the character of the Masai in general reveals the same virtues and vices as that of other primitive peoples, but then also that the Masai are definitely to be counted among the better half of these peoples.

181 609 The following little story, which a man from the Kilimandscharo area of Moschi once told me, shows how the Negroes illustrate the character of the Masai. "It was many years ago when we still fortified the area well with ditches and thorn hedges and the few approaches were both made hidden and well guarded. One day a couple of our people went into the steppe to see whether an elephant had fallen into the trap pit made there. There in the bush they found an old, sick Masai near starvation. Full of compassion, they took him home with them, where he gradually recovered. The convalescent seemed filled with gratitude and swore eternal friendship toward his benefactors when he departed to seek out his kraal again. A few days after his departure the war cry of our people suddenly resounded one night throughout the area. The Masai had come to make war on us, led by that old man who during his stay here had become familiar with the roads and bypaths and who owed his life to us."

201 152 Astonishment, depending on its degree, is expressed by a more or less wide opening of the eyes and the mouth, as well as by a simultaneous raising of the eyebrows.

• [147] A feeling of shame is manifested by a darkening of the skin of the face and often also the throat, corresponding to the "blushing" of the white race. In order to express indignation one looks at the other with wide-open, staring eyes often cast slantwise. One observes the same in the case of obstinate children.

In reflection the forehead is wrinkled longitudinally and often also transversely in its middle section.

To express ill-humor, depression, anger because of loss, etc., one scratches the head bent to one side -- usually to the left -- with the right hand and thereby wrinkles the forehead transversely above the root of the nose.

/121 cont./

201 152 In contentment the eyes sparkle, and there is a happy expression on the face.

The stubborn one often presses his lips together tightly. In lying, especially in stiff-necked lying, the one concerned usually exhibits a well-played /122/ candor and the absence of any trace of consciousness of guilt, which often increases to the point of indignation, as though over an unjust suspicion. The Masai shows here a great talent for acting, which he probably has in common with most of the dark-skinned African races. Even when he sees himself convicted and has gained the impression that the judge or master is convinced of his guilt, he does not stop lying, but often persists for a long time in the behavior just described. More rarely his look gradually becomes uncertain, the eyes blink, the skin darkens somewhat, the voice becomes husky and somewhat hoarse and his facial expression says approximately: "Now nothing more will help!"

201 152 As a sign of contempt one spits before the one held in contempt. More rarely among men, but commonly among women, the same feeling is expressed by pushing out the lips and lower jaw and simultaneously extending the head forward.

The feeling of disgust is manifested by spitting.

An extreme degree of fear is shown by a blanching of the skin, especially of the face, trembling of the hands, trembling in the voice, blinking of the eyes, which move unsteadily toward the sides, whereby the head either stays still or is turned in the direction of the eyeballs.

Laughter often increases to a pitch that brings tears to the eyes.

In order to indicate that one is not in a position to do or to prevent something, or to protect oneself or a friend from a loss, to convince someone of the truth of one's words, one shrugs one's shoulders, turns the elbows inward, spreads the hands out, and opens the palms while raising the eyebrows.

Petulant children make a face as though they intended to start to cry.

000 Clothing and adornment. -- Cloth materials. -- Leather dressing. -- The individual articles of clothing. -- "Beautifying" the body, head hair, beard, body hair. -- The hair style of the warriors. -- Painting of the face and body. -- Caustic and incised decorative scars. -- Teeth. -- Fingernails.

291 177 [439] Cloth materials, such as the caravans from the coast engaged in the ivory trade in the Masai steppes take along trade goods, have not yet ever really succeeded in being adopted among the Masai.

For the trade this is, of course, regrettable, but for one who comes into frequent, daily contact with the people it is really fortunate, for there is scarcely an uglier and more repulsive sight than a native decked out as completely as possible in European clothing, especially if one sees him thus amidst his fellow tribesmen in their traditional garb exactly suitable for them. Not only is the eye offended, however, but also the nose and further many another. One should merely consider that the people have never learned how to manage with such clothing and that generations will pass before its use has to a certain extent become part of their flesh and blood.

[296] /136/ A cleansing of the things therefore does not occur and likewise the regular drawing off and on. The native hangs on his body whatever he gets and keeps it on until it falls off by itself, so to speak. Naturally he always stinks and as a rule also harbors all [515] [147] kinds of vermin. One day I met with a European caravan a Masai youth whose former master had departed some six weeks previously and, upon leaving, had given him a pair of shoes. The boy told me quite innocently that he had put the shoes on at the time and had never removed them since! The people of the caravan, European and Colored, confirmed this statement. Such aesthetic aberrations are very rare exceptions among the Masai, however. Every sensible person disdains bedecking himself with such trash, and that boy would also /El. 43 appears here/ come to his senses again when the shoes were in shreds. From then on I always saw him only in Masai dress.

/189 cont./

757 For gonorrhea they use a whole number of medicaments, to some of which they attribute only or chiefly a diuretic effect, to others a healing effect as well. The principal remedies are the following: decoction of the bark of ol jani 'ajugi (Embelia kilimandscharica), often mixed with calf urine; furthermore of os ngarasam (Rauhinia reticulata), ol debesi (Acacia cfr. venugia Schwfth.), ol mukoran (Albizzia anthelmintica) and ol geisi (?); a root decoction of the latter is also used, as well as of ol ormolo (Cissus quadrangularis Gilg), ol amamisi (Cyrtis tenuifolia Engl.), ol dorrow, and, finally, decoctions of the dried root bark of o'remit (Salvadora persica) and of the wood of a ficus species (ol mesigie kata), which is regarded especially as a diuretic.

[164] /184/ For cystic catarrh one drinks a weak decoction of the root of o'remit (Salvadora persica).

832 A bark decoction of ol dimiyoni (Pappea capensis) is regarded as an aphrodisiac for men, one made out of ol mukoran (Albizzia anthelmintica) for women. The bark of the trees ol gilerji (Acacia abyssinica) and ol ekiwai, used as seasoning for meat broth, is

[263] supposed to have the opposite effect among the warriors.

These last two remedies, however, are by no means regarded as sedatives, but, on the contrary, as stimulants. The people

• [149] explain the effect ascribed to them here with the words: the warrior does not like the odor of the girl, by which probably a specific foetor uriae /stink of urine/ more or less clinging to the clothing of all women is to be understood.

Nerve Ailments

757 With headache (ndg ga ol ogunja) a blister is produced on each

[164] of the temples and on the nape with the fire twirler (ol kiyoi) rubbed hot; more rarely one ties a cord rather tightly around the forehead

[177] and the occiput. The latter remedy is not peculiar to the Masai, but has been adopted in places from other peoples.

[164] For earache (ndg ga ñi gia) one pours warm butter into the ear.

/133 cont./

201 152 A threatening with blows, just like the energy of a blow is indicated with a smacking sound that the index finger mapping down on closed thumb and middle finger of the right hand produces, a movement that is executed from the wrist and to a lesser extent also from the elbow and is sometimes observed among us as an involuntary reaction after taking hold of an unpleasantly hot object, or also among mothers after taking a pinch. Besides this gesture one also finds another, the mapping of the middle finger from the tip of the thumb on the ball of it, common among us. Often this expresses a higher degree of threat, a threatening with weapons. On the other hand, however, one also finds it as an expression of endearment, whereby at the same time the shoulders are drawn up.

If the blacks wishes to emphasize emphatically that something is altogether at an end or gone, that nothing is left of it any more, he runs his thumbnail directly behind the edge of his upper incisors and pushes it quickly forward with a mapping sound.

201 154 I observed repeatedly how mothers reprimanded their naughty children, in that they accompany their use of signs/words on which that is, go, or things will go badly with you! with a motion of the hands, which consisted of her rapidly peeing the palms of her hands, turned toward each other, half clapping, half grating, and, to be sure, the right hand, chiefly active in this, would be mapped forward from behind.

• 151 /134/ The strength of vision of the blacks, like that of other primitive peoples, is very good. Often they already see objects in the landscape or distances at which a normal-sighted European could not yet discern anything. The author was particularly struck by the fact that the people were able to recognize an object seen at great distances better than the Europeans, even such whose eyes, through many years' residence in the country, were accustomed to the peculiar forms of vegetation and lighting effects in the steppe. When the latter was in doubt as to whether it was a matter of, for example, a man or a tree stump, or of a termite hill or a large antelope, the blacks's power of recognition always proveeds to be the better one. [154] Thus they have at their disposal a valuable judgment of distance in

/124 cont./

151 proved by the fact that they prepare the ground plan of the huts, the
[60 9] wire spirals and wire rings serving for adornment, etc., without mechanical measuring devices. For the same reason one recognizes their sense of symmetry in their weapons.

151 Following the Holmgren wools-yarn procedure, I examined 87
125 blind, and, to be sure, 46 men and 41 women, on their sense of color. The test showed that of all only one man had "weak color sense," all the others, on the other hand, had "normal color sense."
[122] Here too the symbolic significance of the colors should be considered: black = calm seriousness, red (blood) = war, green = peace, variegated, and, to be sure, especially in the combination of red and white, expresses joy, gaiety, but also frivolity and fickleness.

Photographs of objects known by them they perceived correctly, those of persons known by them not at once, but always only after longer observation. Often the perspective foreshortening of an object in the photograph was incomprehensible to them; they regarded such a one as incomplete.

153 Their powers of orientation in the region and their memory for
151 paths once taken or stretches of land traversed are excellent. Their
153 memory for numbers seems to be better than that of most tribes in the
[122] interior of East Africa, since, unlike the latter, they do not use
[211] mechanical aids such as notches in sticks, knots in string, etc. Their power of conceiving numbers does not seem to go beyond five: only a few could recognize at a glance the correct number of more than five objects placed before them.

53 Their feeling for plastic art is shown by the rich and not unhand-
619 some adornment, the handsome forms of their weapons, the painting of the shields, the decoration with cowrie shells and beads on utilitarian objects and clothing. Representational art is unknown to them. A feeling for music is completely lacking: their singing is arbitrary and without rules, the main thing in it is the text and the alternation in the vocal execution. They do not have musical instruments, for the antelope horn of the summoner to legal proceedings serves only to attract the attention of the people through loud noises. The following is a
533 common song to accompany the dance (1):

1. Recorded by Herr Hahnert /staff physician/ Dr. Hendrik.

number of women available; at times a poor relation will join in a gate with a richer one; again, mothers and mothers-in-law and deceased brothers' wives are frequently included; and nowadays married warriors are found staying on with their fathers. Thus a symmetrically arranged 'gate' is seldom found in practice.

The practical effect of this system is that a Masai elder attempts to main a constant succession of wives, marrying new ones to replace those who depart with their sons. As there are no unmarried adult women amongst the Masai, this means that senile old men take to wife girls only just past the age of puberty. As such girls have previously been accustomed to the companionship, both sexual and social, of the moran, it is little to be wondered at that they frequently run away, or attempt to run away, with their erstwhile companions. The elders have no idea of preventing this by making the girls' married life more attractive than their previous one; their only remedy is force.

The two primary motives for polygamy are the desire for children, and the necessity to have women to tend the cattle. There is little sexual jealousy amongst the Masai; within the age-set the wives are communal to all age-mates, and an age-mate known to be the father of one's child is regarded as a special friend. Intercourse between men of one age and the wives of another is nominally prohibited, but its extensive practice is acknowledged by the Masai, and in fact receives general connivance. Concerning the economic motive for polygamy, increasing herds necessitate more women to tend them, and at the same time offer the means of obtaining such women. Not that the actual dowry is heavy — usually three heifers and a bullock — but a man prefers to marry off his daughters to a rich elder, rather than to a poor moran. Thus economics and sociology are closely linked, and action in one sphere will have repercussions in the other.

The extent to which polygyny is practised can be judged from the following table :—

Distribution of Wives amongst Adult Male Population.

	Kibaya		*Sonotoo*		*Engaruaut*		*Longido*		*Total*	
	men	wives	men	wives	men	wives	men	wives	men	wives

/83 cont./

words and blows by the assembled warriors, because they did not rear their son to have the hardening and self-control necessary for a warrior, while the weakling is reviled for a long time afterwards as ekiyo = coward, or ilkiyai = the bad one. After the circumcision all the men of the neighborhood gather in the kraal, where they are regaled with meat and honey beer by the fathers of the ones just circumcised, after the latter have kindled a fire with juniper twigs (Juniperus procera). The festival is called ol ogir i el ajok amerita, that is, the festival of the circumcised boys. Unbelievable amounts (1)

1. I once observed that my four Masai boys together at an evening meal ate over 80 pounds of lean meat.

of raw or half-cooked meat slightly roasted at the open fire are consumed in the shortest time by the married men and women, whereas the warriors neither eat meat nor drink honey beer, but only take some fresh milk. People joke and laugh and everyone seems to want to outshout the others. The warriors boast of alleged heroic deeds in former wars and discuss the prospects of the ones circumcised that day on their first military expedition, which will perhaps take them to this or that region, where they themselves had made an attack only a short time before. The fathers dream of their sons' future heroic deeds and are happy at the thought of the rich booty with which the budding warriors will augment the paternal herds. Suddenly the glances of a few who had just been joking darken and turn toward a distant hut at whose door a solitary old man is sitting. They jump up and go toward him with quick steps. The angry expression on their faces matches their rough and abruptly uttered invectives and threats, in which one hears the reproaches that the old man has brought up his son to be a weak coward, who during the circumcision betrayed his pain by a twitching of facial muscles and a half-suppressed groan, which they, however, jeeringly compare to the roar of pain of a bull being cut. The old man has quickly fled from their imprecations into his hut, and his attackers vent their wrath on two gourd bottles of honey beer left standing, which they knock over and

881 /63 cont./

[626] trample underfoot. The one now scorned had also wanted /64/ to
[152] regale guests with it on that day, but no one came to him whose son showed himself to be a ilkiboni. While the old people, as long as
[535] there is something to eat and drink, are only interested in that, the
[538] warriors, already early in the afternoon, start to dance and sing with the young girls and amuse themselves in this way into the night. Not until about ten o'clock do they go back to their kraal, to which the girls presently follow them, after they have begged for a little more milk, which they take along to their lovers. /Ill. 18 appears here./

[158] The circumcised boys, soon after the completed operation, went into the huts of their mothers and stayed there for seven days, until a superficial healing of the wound has taken place. In order to hasten this, they are particularly well cared for and are given only milk, blood, and meat. During the following period, until complete
[411] healing, they roam in small bands with bow and arrow -- they do not
[223] use the ordinary bows, but ones only about half as long, made only for this occasion; the arrows used with them have a wax ball at the tip -- through steppe /65/ and forest, in order to shoot small birds, the skins of which they string by the beaks on a cord, which they place garland-like around forehead and occiput. Between the bird
[301] skins the en sibolio (sing. on siboli) -- as the newly circumcised ones
[302] are called during their recuperation -- stick an ostrich feather on each side of their heads and paint their faces with white clay (en dongu). On the first day they go out, they slaughter a white goat-
[262] buck on the steppe. After they have roasted and eaten its meat, they throw the gnawed bones into the fire. This meal is called ol gîne i ol benek (ol gîne = the goat buck, ol benek means the tree with whose branches they make the fire). Every evening after their excursions they return to the kraal and to the huts of their mothers.

881
591 As soon as the young girl, who until then has lived in the warrior kraal in the most unrestrained freedom, concludes from certain

[TEXT CONTINUED ON PAGE 86]

561 /77 cont./
701 Mixed, light colors are the symbol of fickleness, frivolity, flighty,
702 childlike, and childish sentiments: they are not proper for adult men
• 152 with a serious conception of life. The festival lasts about a month
865 as a rule. During it the youths practice handling the weapons, tell
[822] each other gruesome war stories, which they have heard from warriors
or invented themselves, and thus stimulate their imaginations, just as
the reading of Indian and pirate stories does this on occasion among
[876] European boys. They artificially make themselves positively wild,
to which also the taking, still strange to them, of various roots and
barks with a nerve-stimulating effect (which will be discussed later),
which they add to the cooking meat, contributes a great deal. All
their yearning is directed toward war and murder, everything in them
is pressing toward killing an enemy, and enemies for them are all non-
Masai. Each of them would like soon to be no longer an ebor alem =
[721] white, that is to say, not yet dyed with blood, sweat. Not infrequently
they turn against defenseless caravans if such happen to be in the
vicinity. Whether or not spoils are to be taken in this is of no im-
portance, only killing and murdering, they do not think any further.
Many attacks on caravans have come about in this way. Such op-
portunities, however, are always rarities for individual troop of youths.
561 The rule is a war expedition against a sedentary tribe. After the
701 fighting, the el barnot again return to the paternal kraal to live there
702 a few more years. During this time they attach themselves more and
[721] more closely to the warriors, in order to learn from them and to im-
prove themselves in the art of war. They accompany the warriors on
their raids and now and then also take part in their foray meals.
Nevertheless they do not gain admittance into the warrior kraal,
which is just as wounding to their self-confidence as the circumstance
that they are looked down upon by the warriors and treated almost
like boys. The wish to be on an equal footing with the warriors grows
ever keener in them. But they still lack two things for that: the
name for their age class and the shield escutcheon.

561 In order to request the bestowal of the former from the el oibont,
[791] a gathering (eb ejgeana) (1)

1. Any gathering for a consultation is called this.

/121 cont./

181 If we summarize the traits outlined above, there results, on the one hand, the fact that the character of the Masai in general reveals the same virtues and vices as that of other primitive peoples, but then also that the Masai are definitely to be counted among the better half of these peoples.

181 609 The following little story, which a man from the Kilimandscharo area of Moschi once told me, shows how the Negroes illustrate the character of the Masai. "It was many years ago when we still fortified the area well with ditches and thorn hedges and the few approaches were both made hidden and well guarded. One day a couple of our people went into the steppe to see whether an elephant had fallen into the trap pit made there. There in the bush they found an old, sick Masai near starvation. Full of compassion, they took him home with them, where he gradually recovered. The convalescent seemed filled with gratitude and swore eternal friendship toward his benefactors when he departed to seek out his kraal again. A few days after his departure the war cry of our people suddenly resounded one night throughout the area. The Masai had come to make war on us, led by that old man who during his stay here had become familiar with the road and bypaths and who owed his life to us."

201 • 152 Astonishment, depending on its degree, is expressed by a more or less wide opening of the eyes and the mouth, as well as by a simultaneous raising of the eyebrows.

[147] A feeling of shame is manifested by a darkening of the skin of the face and often also the throat, corresponding to the "blushing" of the white race. In order to express indignation one looks at the other with wide-open, staring eyes often cast slantwise. One observes the same in the case of obstinate children.

In reflection the forehead is wrinkled longitudinally and often also transversely in its middle section.

To express ill-humor, depression, anger because of loss, etc., one scratches the head bent to one side -- usually to the left -- with the right hand and thereby wrinkles the forehead transversely above the root of the nose.

/121 cont./

201 In contentment the eyes sparkle, and there is a happy expression
• 152 on the face.

The stubborn one often presses his lips together tightly. In lying,
201 especially in stiff-necked lying, the one concerned usually exhibits a
152 well-played /122/ candor and the absence of any trace of conscious-
577 ness of guilt, which often increases to the point of indignation, as
181 though over an unjust suspicion. The Masai shows here a great talent for acting, which he probably has in common with most of the dark-skinned African races. Even when he sees himself convicted and has gained the impression that the judge or master is convinced of his guilt, he does not stop lying, but often persists for a long time in the behavior just described. More rarely his look gradually becomes un-
[147] certain, the eyes blink, the skin darkens somewhat, the voice becomes husky and somewhat hoarse and his facial expression says approximately: "Now nothing more will help!"

201 As a sign of contempt one spits before the one held in contempt.
152 More rarely among men, but commonly among women, the same feeling is expressed by pushing out the lips and lower jaw and simultaneously extending the head forward.

The feeling of disgust is manifested by spitting.

[147] An extreme degree of fear is shown by a blanching of the skin, especially of the face, trembling of the hands, trembling in the voice, blinking of the eyes, which move unsteadily toward the sides, whereby the head either stays still or is turned in the direction of the eyeballs.

[522] Laughter often increases to a pitch that brings tears to the eyes.

In order to indicate that one is not in a position to do or to prevent something, or to protect oneself or a friend from a loss, to convince someone of the truth of one's words, one shrugs one's shoulders, turns the elbows inward, spreads the hands out, and opens the palms while raising the eyebrows.

Petulant children make a face as though they intended to start to cry.

/122 cont./

201 An expression of guilt, cunning, or jealousy can be recognized.
• 152 If these feelings are very intense, the one conscious of guilt often holds one hand bent into a loose fist, in front of his mouth in such a way that the lower joint of the index finger lies crosswise below the root of the nose, whereas the jealous one appears surly and silent before he turns to violence. One who through cunning wishes to lure into a trap, to deceive, or to lie to another looks at him as little as possible; only now and then he gives him a more or less shy glance. The European will observe this especially often.

201 A low whistle is regarded as a sign to observe absolute silence; a blinking with the eyes admonishes the initiate to keep a secret. Warriors, for example, use the former during a night attack, brigands when a victim is approaching, thieves, etc., when there is danger in delay. One can often observe the latter in the case of one accused, when he is confronted with witnesses, and one also sees it not infrequently on other occasions when one /123/ questions a Masai and another one standing nearby wants the former to give false or no information.

Affirmation is expressed by a single, brief tossing back of the head and a simultaneous lowering of the eyelids. As a sign of negation the head is shaken laterally.

It has already been mentioned that one does not point at a person with the finger, but rather indicates the direction concerned with thrust-out tongue or lips or lower jaw. The index finger is
[789] precisely the finger under the nail of which one may apply the magic medicine. This thought is also the basis of the threat with the index finger -- which is done as among us. -- The threat is therefore merely an ostentative display or holding of the finger, which can bring danger to the one threatened. One points to animals and inanimate objects, with the right arm extended, with the hand, while index finger and the middle finger are outstretched, whereby the tip of the latter rests on the nail of the former.

/123 cont./

201 A threatening with blows, just like the energy of a blow is
• 152 indicated with a smacking sound that the index finger mapping down on closed thumb and middle finger of the right hand produces, a movement that is executed from the wrist and to a lesser extent also from the elbow and is sometimes observed among us as an involuntary reaction after taking hold of an unpleasantly hot object, or also among snuffers after taking a pinch. Besides this gesture one also finds another, the mapping of the middle finger from the tip of the thumb on the ball of it, common among us. Often this expresses a higher degree of threat, a threatening with weapons. On the other hand, however, one also finds it as an expression of embarrassment, whereby at the same time the shoulders are drawn up.

If the Masai wishes to emphasize emphatically that something is altogether at an end or gone, that nothing is left of it any more, he runs his thumbnail directly behind the edge of his upper incisors and pushes it quickly forward with a mapping sound.

201 I observed repeatedly how mothers reprimanded their naughty
861 children, in that they accompany their eno el aigoschobo eh abiak, that is, go, or things will go badly with you! with a motion of the hands, which consisted of her rapidly passing the palms of her hands, turned toward each other, half clapping, half grazing, and, to be sure, the right hand, chiefly active in this, would be snapped forward from behind.

151 /124/ The strength of vision of the Masai, like that of other primitive peoples, is very good. Often they already saw objects in the landscape at distances at which a normal-sighted European could not yet discern anything. The author was particularly struck by the fact that the people were able to recognize an object seen at great distances better than the European, even such whose eyes, through many years' residence in the country, were accustomed to the peculiar forms of vegetation and lighting effects in the steppe. When the latter was in doubt as to whether it was a matter of, for example, a man or a tree stump, or of a termite hill or a large antelope, the Masai's power of recognition always proceeds to be the better one.

(cont.) That they have at their disposal a reliable judgment of distance is

/186 cont./

276 171 [171] have adopted many of their manners and customs the warriors regard becoming stricken with the em boschona as a sign of true, ferocious warriordom, and they frequently simulate it for this reason. Amidst whooping cries the simulator with spear in hand dashes out of the camp and would surely not inflict an injury on anyone, even if -- as in the /187/ cases observed among the Wadschagga -- a few people did not immediately run after him, seize him, and lead him back.

276 [152] The lack of any control over emotions and inclinations probably also plays a not unimportant role in the occurrence of em boschona. Its cause seems to me, however, to lie entirely in the excessive use of the aforementioned excitants, so that the illness would not occur at all if they were avoided completely or were taken only in a very considerably lesser volume. Their harmfulness can be observed almost 276 561 daily among the warriors in an abnormal state of nervous irritability. This view is based on my observations (with which all the statements on this point made to me by the Masai agree) that only the warriors, that is, the young, strong, healthy men, are stricken with em boschona, while boys and youths, before they enter into the association of the warriors, and even during the flow period as such, and furthermore married men, as well as girls and women, remain completely immune to it. These persons, however, either do not take any of the stimulants named at all, or only in very small measure.

276 158 191 In this description of em boschona one is inevitably reminded of the running amok of the Malays. Only the complex of symptoms is similar, however, while the etiology and the prognosis are entirely different. Whereas running amok as a rule ends with the death of the person concerned, em boschona is cured within a few days. Whereas the effect of opium as the original cause of running amok is today no longer regarded as decisive, in every case of em boschona the copious use of those agents only a short time before will be indicated.

*** ticks, tsetse fly, and disease.

Burning grassland appears to be a deeply ingrained cultural tait. Young herdboys will seek out and ignite small patches of unburned grass, sometimes only one or two feet across. We have watched Masai moran striding across a dry plain lighting matches as they went, leaving a long line of small blazes gradually joining together behind them. We have watched junior and senior elders lighting fires, as well as boys and moran. We had marked plots that were burned as much as four times in one year. So we would add to the above explicit reason for burning, the implied reason that they also burn simply because they get some satisfaction out of i.

182
372
[171]

Fires are lit with matches. Possibly some are started from cooking fires that get away. Some fires, especially in wooded areas, are started by Wandaroba honey hunters (see below). But virtually all the fires whose origins we investigated were lit by Masai.

177
372
182

It seems probable that the coming of Europeans has altered the fire regime by providing large supplies of matches. It is far easier to light fires with matches than by using flint or other primitive means. With fires

151 proved by the fact that they prepare the ground plan of the huts, the
[804] wire spirals and wire rings serving for adornment, etc., without mechanical measuring devices. For the same reason one recognizes their sense of symmetry in their weapons.

151 Following the Holmgren zephyr-yarn procedure, I examined 87
125 Masai, and, to be sure, 46 men and 41 women, on their sense of color. The test showed that of all only one man had "weak color sense," all the others, on the other hand, had "normal color sense."
[822] Here too the symbolic significance of the colors should be considered: black = calm seriousness, red (blood) = war, green = peace, variegated, and, to be sure, especially in the combination of red and white, expresses joy, gaiety, but also frivolity and fickleness.

Photographs of objects known by them they perceived correctly, those of persons known by them not at once, but always only after longer observation. Often the perspective foreshortening of an object in the photograph was incomprehensible to them; they regarded such a one as incomplete.

• 153 Their powers of orientation in the region and their memory for
151 paths once taken or stretches of land traversed are excellent. Their
153 memory for numbers seems to be better than that of most tribes in the
[802] interior of East Africa, since, unlike the latter, they do not use
[211] mechanical aids such as notches in sticks, knots in string, etc. Their power of conceiving numbers does not seem to go beyond five: only a few could recognize at a glance the correct number of more than five objects placed before them.

53 Their feeling for plastic art is shown by the rich and not unbecom-
619 ing adornment, the handsome forms of their weapons, the painting of the shields, the decoration with cowrie shells and beads on utilitarian objects and clothing. Representational art is unknown to them. A feeling for music is completely lacking: their singing is arbitrary and without rules, the main thing in it is the text and the alternation in the vocal execution. They do not have musical instruments, for the antelope horn of the summoner to legal proceedings serves only to attract the attention of the people through loud noises. The following is a
533 common song to accompany the dance (1):

1. Recorded by Herr Hakenzu /staff physician/ Dr. Sieudzki.

Kenya

As stated above, *Ol Piron* means a foretick. I have been given a reason for the use of this term, but was not convinced of its truth. The elders of the *Ol Piron* generation stand in a particular position of guardians to their juniors who recognize their authority to a far greater extent than they do that of elders of other generations. This relationship has considerable political as well as domestic importance. 561

Manyatta.—The *ainé* is the unit for a single manyatta, except when the whole age-group of a single area combine to form one manyatta for some ceremony, *e.g.* the *E-Unoto.* 561 561 648

For some years the policy of Government was directed towards suppressing the warrior system, and manyattas were prohibited, each warrior being supposed to live in his father's village. With increasing control and understanding of the tribe this rule has been somewhat relaxed, and the warriors are now commonly allowed to have manyattas provided that they continue to behave themselves before the law.

But the general effect of Government policy has profoundly modified the original customs with regard to warriorhood, and it is now rather difficult at times to know exactly what they were. The main political effect is that warriorhood lasts for a much shorter period than formerly, and most men marry and become elders within four or five years of their circumcision. 561 179 561

Nowadays the parents are somewhat unwilling that the girls should live in the manyattas, and so there are only a few of them to be seen there.

A manyatta usually differs structurally from an elder's village in that it is simply a circle of huts without the usual thorn hedge round it.

Sun Lifs.—The word written by Mr. Leakey *tuindin* would perhaps best be spelt as two words *Tuindi ipuk.* *Tuindi* is a second person singular imperative of a dative word (see Hollis, p. 77) which I have never heard except as described by Mr. Leakey. *Ipuk* means "we" or "us." 736 [illegible] [illegible]

When a man has been accepted by a girl who has been so addressed he usually holds out his hand to her with the tips of his forefinger and thumb touching to form a circle. She is then supposed to break the circle so formed with her forefinger. This is regarded as making her acceptance binding. [illegible] [illegible]

It is a great disgrace for a warrior to cause an uninitiated girl to conceive, and he must kill an enemy in order to wipe it out. This is, in fact, the usual reason for the occasional murders of people of other tribes, frequently ascribed erroneously to a desire on the part of the murderer to "blood his spear." 892 159

The E-Unoto Ceremony.—Nowadays this takes place from three to five years after initiation. It is not a single ceremony for the whole of the Masai, but there are a number of separate ceremonies according to the groups enumerated in my age-group table above. 561 [illegible]

6:Thomson K-3 (1883-1884)1887
FL12 Masai FL12

ceived from the traders, he, of course, did not keep 413
himself, but divided among his swordsmen of the kraal.

And so with war and women, life passed in happy fashion. 157
His demeanour was serious, and his expression firmness, though he acquired an aristocratic hauteur truly striking. He showed curiosity in a dignified manner. He rarely indulged in vulgar laughter, and smiling was hardly possible on a face which could only be called foolish.

He passed some twenty years in this manner. At last his 764
father was found to be on the point of death, and he was 185
sent for. Shortly after his arrival, the old man succumbed.

301
309
543

THE CHIEFTAIN, MARKED WORK.

It was not thought necessary to recognize this ceremonious-place ceremonies in any way whatever, and therefore Moran lost no time in picking up the corpse and throwing it outside the kraal. Next morning, he smiled grimly as we going out, he kicked aside some freshly-picked bones, and glanced at some fingering hyenas sidling away, in company with mangled stocks, while vultures flapped gravely overhead.

He was now sole heir of his father's herds, for his younger 414
brothers did not receive a single head of cattle, though they 185
had explored in their raids considerable numbers of them. Any they might have now, however, would be their own 815
property. Moran decidedly preferred the free and easy life of the warrior's kraal, but, alas! he discovered, not that he was

6:Thomson K-3 (1883-1884)1887
FL12 Masai FL12

abandoned, and, though meat and milk were still the main items of his eating, he could now vary it with vegetable food obtained by his wife from neighbouring agricultural tribes. Luxuries, also, he might now indulge in. He sported a fancy snuff-box and tobacco-box of ivory or rhinoceros' horn, and delighted to rap up its contents as he handed it to a friend. He chewed tobacco (mixed always with natron), though he never smoked. Then, as often as convenient, he liked to foregather with his friends, and have a jolly carouse over beer or meat.

It is pleasant to know that with this change in his mode of life there was a corresponding alteration (very much for the better) in his views of things. He delighted to talk with the traders whom before he had gloried in killing or annoying, and would in token of good-will cordially exchange the courtesies of life by spitting upon them and being spat upon. In his conversation he showed an intelligence far superior to any specimen of the Baster tribes. He had no suspicions, and was communicative about his affairs and beliefs. He would even at times exercise a friendly guardianship of passing traders, and was able to ward off many a disaster by judicious warning. He was not stinted in his generosity, and generally gave far more than he got. He has been known even to protect stranded persons, and tend sick men left behind.

The softening down of his ferocity reacted upon his face. The habitual scowl gradually died away, and was replaced by a more pleasing and genial expression. His thoughts turned more to the strange mystery of life. He, also, had little that was cheering to look forward to. He believed in the existence of a Supreme Being, and yet had not the faintest conception of an after-life. Unlike the men of the Baster race, he did not believe in ghosts or spirits. He had no theory of dreams, and did not imagine like the negro that when he dreamed he was really experiencing all that was passing through his brain, and that his soul or spirit was actually knocking around somewhere, having a good time of it, unhampered by his body. Masai believed nothing of that; indeed, whether he had any idea on the subject, I have not been able to determine. When the man died, he was finished utterly, except so far as he might go piecemeal to build up the body of a hyena, a vulture, or a marabout stork. The Masai believes in annihilation. To bury a corpse would, they think, be to poison the soil; it must be thrown to the wild beasts without ceremony.

6: Thomson K-3 (1883-1884)1887
FL12 Masai FL12
Wa-Kore G

between the married and the unmarried people, very little work being expected of the latter, and the sweetheart system being preserved. They all, however, occupy the same village, and of course the young men cannot afford to live on meat, though they always come in for the lion's share when any of it is going. When parties go off on war-raids, they also contrive to eat a bullock by way of getting up their courage.

They lead upon the whole a very miserable life, ever threatened with destruction by the Masai, who have swept off several villages and all their cattle. The soil being the very richest loam, brought down from the mountains and spread over a comparatively level plain to the south of the lake, it is capable of producing anything; only the extreme dryness of the air and the very small annual rainfall, confined to a couple of months, keeps it sterile and barren. To ameliorate this unhappy condition of things the Wa-kwafi have developed a wonderfully ingenious system of irrigation by artificial canals of (for them) great magnitude. They construct dams across the deep channel of the Guaso Tigitoik and thus raise the level of the water to that of the plain, and then, by an intricate network of channels, they spread the precious fluid over a large area, and raise their millet and maize. These products form almost their sole food, eked out by what they are able to kill in the chase and by fish from the river, though where most in scarce they are not indebted even of rats. Of these there were simply myriads. They swarmed everywhere, and nothing was too sacred for them. Need it be wondered if "oft in the stilly night" were heard impressions loud and deep upon the wretched pests when I have been wakened up by my nose being bitten or the sanctity of my lair invaded. My books were devoured, and even the bullets in my cartridges were not too indigestible. Everything, indeed, had to be kept under lock or hung up under shade as represented on page 312.

As in the case of the Wakavirondo, the Wa-kwafi are singularly honest and reliable, so much so that valuable goods and equally valuable food are left in their charge with the utmost confidence, and I have heard of no case of this being violated. To me, one of the most remarkable features in the character of the young women and girls was their absolute unconsciousness of fear in my presence, and the complete confidence they seemed to have in me. They indeed took

[58]

presence of my premises with the most agreeable abandon, rolled about the floor like young puppies, mimicking everything with the curiosity of monkeys. They accepted not to sit down on my knee, and with feminine blandishments which I could not resist, compelled me to go through my fashionable and highly original entertainment of drawing my own teeth. This was a never-failing source of amusement, and was received each time with fluttering remarks of appreciation. Martin, desirous of reaping closer fame and attending the

[57]

A. CHRISTIE, [illegible], NEW YORK PUBLISHER.

attention of the damsels, got beautifully caught on one occasion. He had been trying to impress upon them that he could do all that sort of thing as well as I, and to absorb his assertion declared that if one of them cut off his finger he could put it on again. He was holding out his finger, and before he knew what was up one girl had made a vicious cut at it, and nearly severed it. Martin did not say that little game again. Next in interest to the tooth-drawing was the consumption of diamond-ware in the looking-glass. It was some

FL12 Masai FL12
Wa-kamba

123 days before they seemed to grasp the uses of the mirror, but
157 their feminine instincts soon told them, and they would frequently get it to see that their ornaments were properly arranged. A few photographs of some of their charming white sisters which I happened to have with me were a great source of delight. They actually supposed them to be living beings, and if told that they were asleep, they were quite satisfied.

123 In the midst of these unsophisticated people, and pleasing incidents which I delight to recall, several days rapidly
136 passed. My experiences were further varied by some shooting trips, in one of which I was so fortunate as to secure two beisa antelopes (*Oryx beisa*), the first I had seen. I also saw for the first time the lesser kudu. The waterbuck were in great numbers about the lake to which I paid a visit.

Before my arrival at Baringo my friend Jumbe Kimameta had proceeded to the country of Engobot, about 120 miles N.N.W., but had left several old men with large quantities of food, donkeys, &c., pending his return south. He had also left a good-natured old fool to go with me, but as he knew no more than myself of the country I now wanted to traverse I could not see the use of him.

And now the final stage, the most uncertain of the whole journey, had to be attempted with the agreeable knowledge that the last three caravans which had preceded me had each lost more than one hundred men by violence. One of these disasters had occurred only the previous year, and yet I now proposed to go into the same country with only one hundred men all told. As in the case of my Lykipia trip, the traders swore it was impossible, and that I would never get back alive. My own men, however, had come to know me by this time, and there was not a remonstrance from one of them. Sadi, though greatly against it, rose considerably in my opinion by stating that he was ready to follow me. Not so Muhinna. He, knowing now the futility of tears and entreaties, took a new line, and feigned extreme illness, groaned mightily as if with racking pain, and if he came to the door did so only with the aid of a stick, his body bent over it, sighing deeply, and in general looking the very picture of woe. I knew it was all a sham, but so thoroughly did I detest him from the bottom of my soul, and so much was I afraid that in the event of my taking him he would play me some ruinous trick, that I pretended to

/21 cont./

791 rises, goes toward him, and, with the customary greeting, extends
5%6 his hand to him, whereby, not this, but the wrist is grasped. After
609 the concluded discussion, for which there are no particular formalities, he takes his leave with the ordinary farewell.

791 In the way of food, the ol oibani takes only goat liver roasted
787 on the fire, milk, and honey, for, through any other food, "he
[262] would suffer the loss of the capacity for prophecy and the preparation of efficacious magic charms." Of these arts very little is
[173] supposed to have been handed down to his son Lemana and still less to Zendeo, through which it is all the more explicable that the /22/ Masai today tell of hundreds of different kinds of miracles that Mbatyan allegedly performed. According to them, he could fell large trees by sheer will power, or he had the hut in which he was to be found set afire by his attendant, and, after it had burned down, he appeared, uninjured, out of the ashes.

756 From the Ei gidoi lineage there are further supplied, as has
[613] already been mentioned, the sorcerer or medicine men (ol goiatiki, ol goiatek), several of whom live in each district. Their office, too, is handed down from father to son, who, however, is usually initiated into the whole secret art only after his marriage. The
[789] most important magic charm in the life of the Masai, the war medicine, the ol goiatiki does not know how to make. Rather, one turns to him only in cases of illness of human beings and livestock for which the well-known remedies fail, or which one traces back to the sorcery of evil neighbors, as well as to determine unknown wrongdoers (thieves, murderers, etc.).

613 The lineage of the Ei kibosin of the Ei mibeljan tribe, who,
[776] according to the view of all the people, are especially favored by 'Ng ai, the god of the Masai, which has made them primarily the bearers of the religious traditions, require a special discussion.
613 Corresponding to their position with 'Ng ai, they are distinguished
• 157 by a relative peaceableness. The young warriors, to be sure, also set out on raiding expeditions with the other lineages, but they thereby seem to avoid any unnecessary roughness or brutality, in which the others often compete. The passion for disputes, quarrels, and vituperation, a prominent trait in the character of the young

/22 cont./

613 Masai, is foreign to them. God rewards them for their virtue by
• 659 preserving their herds against predatory animals and thieves. It is
not supposed to have yet happened that one of their cattle was
613 killed by a lion or otherwise eaten. The El kiboshi are particularly
789 esteemed by all the other Masai on account of their ability to cause
821 rain. The author one day saw such a rainmaker at "work" near a
Masai kraal. He was lying on the ground under a big leather apron
such as is worn by old men, so that one could see only a slight
movement of the arms and now and then hear a soft murmur. After
a while he stood up and explained that rain would "soon" come.
Since I had had rain during the preceding night in the camp six
hours away, it is very probable that here, too, it had not failed to
appear for very long and thus saved the reputation of that rain artist.

613 The only slight differences in the customs of the El kiboshi
lineage compared with those of the other lineages will be discussed
in the individual sections.

/23/ E.

000 Kraal. -- Construction and arrangement of the huts. -- Stall for

head. -- Expelling and separation of the family members. -- The
family kraal. -- Daily life. -- Work. -- Foods. -- Tobacco. --
Honey beer. -- Play. -- Household equipment.

361 In the vicinity of a few shade trees and a small kwak the Masai
villages lie scattered in the burning hot steppe. They are circular
kraals (olg ôl, lg olôl) or olg ainô, lg ainô (Fig. 7)), which
are formed by a ring of huts (olg olôl, lg olôlôl) built close to
one another. A kraal contains 10 to 30 huts. At two places
opposite each other are found the entrances (ol gîshonô) three to
342 four meters wide. Since the Masai, as nomads, continue to live
361 in one place only as long as they have good pasture for their live-
stock, the huts are /23. I appear here/ built easily and cheaply
out of material available everywhere.

/[illegible] cont./

576 When an acquaintance wants to enter the hut, he calls -- corresponding to our knock -- "[illegible]" a female owner of the hut, whereupon from inside, like "Come in!" comes the answer, "[illegible]" a "we are here." Thanks for a favor shown or a gift is hardly ever customary, only very rarely does one hear the word [illegible] a thanks. A request is refused in that one "wards off" with the hand, the palm of which is turned toward the one making the request.

[501]

The farewell runs "[illegible]" if one person is going away, "[illegible]" if several take their leave, and means "I am going" or "we are going." It is used similarly by all people and only by unintroduced children is not accompanied by the handshake. A friend taking his leave is requested to remain longer with "[illegible]" a "do not go." In conversation with their kind the Ikmet are very talkative. The women among themselves relate old and new ver adventures, which are presented with lively gestures and in exaggerated embellishment. Usually a fellow villagers or lineage member plays the leading role in it: the enemy is always cowardly or lets himself be surprised. Together with the young girls, the conversation soon becomes uninhibited and launches into very witticisms and bold jokes. In the kraal of the married, men and women sit in separate groups. The former speak quietly and often in subdued voices about memories of their youth, work raising, etc.; the latter, on the other hand, laughing and with extraordinary glibness of tongue, converse about gaudy tales in which some slur is cast on his, or him, to-and-fro. But let it be said to the credit of the Ikmet that their gaudy is childish and harmless. One does not find malicious scandalmongers of either sex among the Ikmet and probably not among the other so-called primitive peoples. They rather seem to be an unknown phenomenon of a higher level of culture. In accordance with the lively, impulsive nature and especially also the sensuous irritability of the younger men, one very often hears coarse and humiliating invectives. Their customs probably sufficiently explain the peculiar ethics of the Ikmet. Crude invectives may not be used by women toward men.

521

[551]

[576]

(24) **B. Sirenie Fan.**—*Further Notes on the Masai of Kenya Colony.*

[54] [54] [54] *Prior to the meat Ol-Nyi'ukar the men must eat meat in the forest or bush. They build a small round shelter, called Ol Pul, of thorns with one entrance about 3 ft. 6 ins. high through which one must crawl. Here they store the meat, and sleep. They may eat the meat either within or without the Ol Pul. There is a picture of an Ol Pul opposite p. 280 in Hollis.*

[56] *The meat is pierced by a wooden spit about 18 ins. long. This is stuck in the ground by the fire and the meat is roasted. Soup is also made of fat and water and the bark of Il Kidinoro or Il Kiborati trees. The decoction of these barks makes the warriors brave. They also ascribe to this cause the curious hysterical fits into which they frequently fall when excited. I was ready for the Il Kidinoro, small doses of which do, in fact, produce a brave and unbalanced state of mind. I have never tried the Il Kiborati.*

[74] [54] *When the warriors sleep in an Ol Pul they pray to God on rising on behalf of their age-group. Each one takes his shower and rubs it in the ashes of the fire in the Ol Pul. He then goes out of the entrance and strikes the side of it and walks towards the East reciting his prayer and striking trees with the shower. While returning he sings the war song Eng-ipolosi of his age-group. As he re-enters the Ol Pul he thrusts the shower into the thorns at the entrance on his right and leaves it there. There are nearly always a bundle of showers to be seen in this position.*

[54] [54] [54] [

[56] [53] [308] East Africa), and the whole body is smeared, from the crown of the head down, with a mixture of red ocal and leaf fat. The dancers gather together into groups of a dozen or more, all facing towards towards a small open space. One young man steps forward into the space, makes a few prancing dance steps, and then starts to jump perpendicularly up and down, his long hair flying up above his head into a kind of halo at the top of each jump.

FIG. 1. THE DANCE OF THE MASSAI MEN

Meanwhile the other dancers clear and group, avoiding their man in jump. Now and then the rope of dancing was abandoned and the dancers formed up in single file, going in procession back and forth across the course of the campaign. As the number of dancers increased, the young men became more and more excited and [59] were a number were throwing fits. Dressing in the morning, eyes staring, arms raised at right angles to the body the soldiers suggest [59] [59] [59]

/191 cont./

296 191 [191] have adopted many of their manners and customs the warriors regard becoming stricken with the *ene lenkana* as a sign of true, fearless warriorhood, and they frequently simulate it for this reason. Amidst whooping cries the simulator with spear in hand dashes out of the camp and would surely not inflict an injury on anyone, even if -- as in the /191/ cases observed among the Wadschagga -- a few people did not immediately run after him, seize him, and lead him back.

296 [152] The lack of any control over emotions and inclinations probably also plays a not unimportant role in the occurrence of *ene lenkana*. Its cause seems to me, however, to lie entirely in the excessive use of the aforementioned enclaans, so that the illness would not occur at all if they were avoided completely or were taken only in a very 296 [191] considerably lesser volume. Their harmfulness can be observed almost daily among the warriors in an abnormal state of nervous irritability. This view is based on my observations (with which all the statements on this point made to me by the Masai agree) that only the warriors, that is, the young, strong, healthy men, are stricken with *ene lenkana*, while boys and youths, before they enter into the association of the warriors, and even during the first period as such, and furthermore married men, as well as girls and women, remain completely immune to it. These persons, however, either do not take any of the stimulants named at all, or only in very small amounts.

296 [152] [191] In this description of *ene lenkana* one is inevitably reminded of the *running amok* of the Malays. Only the complex of symptoms is similar, however, while the etiology and the prognosis are entirely different. Whereas running amok as a rule ends with the death of the person concerned, *ene lenkana* is cured within a few days. Whereas the effect of opium as the original cause of running amok is today no longer regarded as decisive, in every case of *ene lenkana* the copious use of these agents only a short time before will be indicated.

1: Hollis G-5 (ca. 1894-1904) 1905
FL12 Masai FL12

174 A tribe coming from the north like the Masai, and possibly at one time in touch with races influenced by ancient Egypt, may conceivably represent not an improvement of the primaeval African stock but a degeneration of some other race. Still, the accounts which we have of the Bari[1] and Dinka ascribe to them the same vague belief in a supernatural power, which most inquirers have reported as existing among the Masai, and an absence of traditions respecting the origin of the human race[1].

175 The history of the Masai, so far as we know it for the last hundred years, presents as its most important feature a conflict between the pastoral and agricultural sections, ending in the victory of the former and the annihilation of large settlements of the latter. The conflict was disastrous for the race, for the portion which survived depended entirely on cattle and waiting for subsistence. The herds suffered severely from plague in the eighties, and the advent of Europeans and the gradual introduction of the Pax Britannica could not be otherwise than unfavourable to the pre-eminence of a tribe whose prosperity depended so largely on continually plundering their neighbours. Nevertheless from at least 1850 to the early eighties the pastoral Masai were a formidable power in East Africa. They successfully asserted themselves against the Arab slave-traders, took tribute from all who passed through their country, and treated other races, whether African or not, with the greatest arrogance. About 1873 they raided Tanga, on the coast near the present German frontiers. Thomson (*Through Masai Land*, 1885) describes how, in 1883, they entered his camp and ordered about the whole caravan, including himself, as if they had been masters and the travellers slaves. This period of triumph was succeeded by

[231] [24] one of disaster. Rinderpest attacked the cattle and small-pox human beings. The surrounding tribes who had suffered from their raids were not slow to revenge themselves for the oppression and plunder of the past, and a severe famine completed the catalogue of misfortunes. The numbers of the

● 61 [175] Masai were undoubtedly greatly reduced, and at present those found in British East Africa only amount to a very modest figure, variously estimated at from 25,000 to 12,000. The latter estimate, which is the latest and perhaps the most correct, is based on the assumption that there are 3,000 in the

[1] See Hillebrandt, *Die Dinka Sprache*, 1888, p. 48, fn. It is true that some expressions ascribed to the Dinka, such as 'We do not know—God alone knows,' might be interpreted as a consciousness of the loss of traditions.

1:Hollis G-5 (ca. 1894-1904) 1905
FL12 Masai FL12

Naivasha province and goes between Kikuyu and Kilima-Njaro.

The expansion of the tribe seems to have come to an end about the middle of the last century. About 1840 they reached their furthest recorded point in the south and were driven back by the Wagogo and Wahehe. The southward movements of the Gallas and Somalis kept them back on the north-east, though as late as the nineties they raided on the Tana river. It would appear that about 1840 the Turkana drove the most westerly branch of the Masai from the west to the south of Lake Rudolf, where they are now settled. Somewhere about the same period—at the time an old man can remember according to the native expression—the Masai dwelling on the Uasin-Gishu plateau attacked those of Naivasha, and after defeating them were in their turn thoroughly defeated by a combination of Naivasha and allies from Kilima-Njaro. The inhabitants of the Uasin-Gishu were scattered to the four winds: those who escaped their brethren were annihilated by the Nandi, and only a few fragmentary remnants survive in Kavirondo, Lumbwa, and the two villages called Great and Little Kajiado at the south end of Lake Baringo. Another branch called L-Oigelia or Sogoili took refuge in the Nyando valley but were wiped out by the Nandi and Lumbwa. The Laikipia plateau, which is now uninhabited like the Uasin-Gishu, was not depopulated in 1884, when Peters crossed it and had many fights with the Masai. According to one story, the people of Laikipia raided some other Masai near Naivasha about 1840 and carried off their cattle. These cattle were suffering from rinderpest, and the result was that all the stock of the Laikipia took the disease and died. This was considered as a judgment on the Laikipia for raiding their brethren.

At present the agricultural Masai are found chiefly near Lake Natron and south of Mount Meru in German territory. In our Protectorate they are represented only by a few isolated settlements, such as the people of Kajiado, the Dorobosh, and perhaps the people of Sambaru in the Rendile country. It would appear that the name Wakwavi, often applied to the agriculturists, is merely a Swahili nickname borrowed from the Masai Kwavi or Kwapi, meaning plain. The pastoral section classify themselves under five districts, with many subdivisions, namely Kaputei (Kaplio plain), Ilo-siposha (Naivasha), Kisongo (the district south and west of Kilima-Njaro), Uasin-Gishu, and L-Ikiyapuk. The two last districts, as mentioned, have ceased to exist, and those who

2: Bernardi E, M-4 (no date) 1955 FL12 Masai FL12

On the whole, these two authorities stress the linguistic unity of all the Masai. 197

The great majority of the Masai are pastoral, only very few tribes having taken to agriculture. The pastoral tribes follow a semi-nomadic way of life. "They move", writes Lord HAILEY,* "with their herds in order to avail themselves of the seasonal variations in water supplies, so that in effect they practise a system of rotational grazing". The same writer,* reports "a recent estimate" of Masai herds in Kenya which puts "the number of cattle at over 700,000, with 800,000 sheep and a large number of donkeys". For Tanganyika no figure is given. The above estimates show clearly enough how the attitude of the Masai to cattle is a paramount feature of their life. To own cattle is a privilege obtained through initiation, and large herds are a sign of outstanding social status. Cattle are the main economic interest and investment for the Masai.* 233 [221] 191 223 664

The total population of all the Masai may be reckoned at about 500,000. The 1948 census of Kenya's population (see Bibl.) gives for the Samburu an estimate of 20,000, and the following figures: Njemps 5,000, the other Masai 67,201. In 1931 the Tanganyika Masai were reckoned as 35, 188. 162 [64]

* * *

Under the present political situation, the Masai are not administered as a single unit, for they are divided into two sections by the border of Tanganyika Territory and Kenya Colony. 63

In Tanganyika the Masai form one of the four districts of the Territory's Northern Province (the Masai District). In Kenya the main group inhabits the reserve adjoining Tanganyika Masai District, and constitutes the Extra Provincial District (Masai District) of the Colony. The other group (Samburu and Njemps) is incorporated with the Rift Valley Province (Samburu and Baringo District), and partly with the Northern Frontier Province. The geographical separation of the Samburu from the other Masai is the reason why the Samburu were considered, and are still considered, as a non-Masai tribe. But, as DRIBERG remarks, they are true Masai. The splitting of Masailand and the separation of the Masai were made 3 [64] [101] 115

* HAILEY, *Native Administration in the British African Territories, Part I*, London 1950, p. 30.

* *Ib. c.*, p. 107.

* In this connection see the article of L. TAMAS, in *Africa*, 18, pp. 48 ss.

An important factor in the tribal system of the Masai is the presence of medicine-men whose duties are in general connected with the divination of future events, with the administration of drugs, and with the practice of witchcraft. There appear to be three grades of medicine-men, whose spheres of influence are divided into these three categories, but, for practical purposes, it is only necessary to consider the position of the first grade, represented by the person of the Laibon, or "Oloibon," who is the Chief Medicine-Man of the tribe. The history of the Laibon is recorded in Mr. Hollis' book on the Masai, pp. [illegible], and it is unnecessary to enter into it here, but it may be mentioned that Wheelton, who died about 1900, and Lenana, his son and successor, acquired such great influence over all sections of the Masai that the position of Laibon came to be regarded by certain of the European officers who had not carefully investigated the facts of the case, as synonymous with that of a paramount chief. It does not appear, however, that the Laibons have ever attempted to assume a position resembling that of kings of native tribes, and the appointment by Government of Lenana, and, at his death, of his son Sage, to the office of Paramount Chief of the Masai was, in fact, the result of a misunderstanding of the normal state of affairs which steps have accordingly been taken to rectify.

The Laibon

The Masai are a pastoral people.

The pastoral Masai "Moran" is made an outcasting tribe obsessed with their manifest activity in following the pastoral mode that were dreaded throughout East Africa and hindered for many years the passage of caravans by the direct route from Uganda to the Coast. When eventually European penetrated the highlands of British East Africa, they found the Masai with their herds and herds scattered over a wide area. The story of how they were eventually concentrated in one reserve is told in Chapter III., but it is necessary to draw attention here to the effect which this concentration, combined with the introduction of veterinary skill and the cessation of raiding by and against them, had on the Masai. In 1906, before any administrative limit had been placed on the movements of the tribe, it was estimated that the Masai possessed [illegible] head of cattle. In 1911, [illegible] head were said to be in the Northern Reserve alone, and this estimate was subsequently increased to [illegible] when the cattle which were attempting to move south had been thoroughly counted. [illegible] head of cattle moved south in 1911, but in the final move from Laikipia in 1912 and 1913, nearly [illegible] head were counted. By March 1914 all the Masai herds being located in one reserve, the total estimate for the tribe had leaped up to [illegible] and the number of cattle in the possession of the Masai is now supposed to be in the neighbourhood of three-quarters of a million. These latter figures are the estimates of Mr. G. W. Dunstead, who has been the Officer-in-Charge of the Masai Reserve for more than five years, and, in spite of the objection taken by the Masai on superstitious grounds to the counting of their stock, they must be taken to be substantially accurate. It is scarcely reasonable to suppose that the earlier figures, particularly the first two mentioned, are in any way exact, but, after allowance have been made for this, it is obvious that an enormous increase in stock has taken place. In addition to this cattle, the Masai are said to possess something over two million sheep and ten thousand donkeys. The stock-carrying capacity of the 14,000 square miles included within the borders of the Masai Reserve, is limited to a certain extent by the swamps driven by the natives to grazing cattle in areas which from past experience they believe to be infected by disease and, in parts of the Reserve, land which appears to be admirably suited for stock remains unoccupied on that account, no attempt having been made to utilize veterinary skill and treatment in rendering their cattle immune from the disease. With the exception of these areas, the Reserve may fairly be said to be stocked to its fullest capacity, and the Masai, who number all told about [illegible] souls, possess capital to an average amount of rather more than £[illegible] per head. They are thus, in all probability, the richest uncivilized tribe in the world. It is not surprising, therefore, considering their conception of manual labour as degrading, the limitation of their personal requirements and their immense wealth in livestock, to find that they are unwilling to work for wages as do the members of other tribes. Their national diet is meat and milk, both of which they have in plenty, and they can procure any other food or commodity they desire by sale or barter of stock.

[illegible]

[illegible]

[illegible]

[illegible]

In his reply, dated the 3rd of December, 1919, the Secretary of State observed that in his opinion the time had not yet arrived when it was either necessary or desirable to impose a cattle tax on the Manal which might be thought by them to be the object or a consequence of the Manal scare.

The Secretary of State, 3rd December, 1919.

In a despatch to the Secretary of State, dated the 8th of March, 1920, the Governor concluded that a review of the present system of native taxation would be desirable or necessary in the near future, but he considered that this was not a matter of urgency and might profitably be held over until the reorganization of native administration had been effected. The Secretary of State agreed that the question might wait for deferment.

Mr. Bowen, Kaduna, 8th March, 1920.

On the 28th of July, 1920, the Resident Bulkeley wrote that he considered the time had come when a tax should be imposed on the cattle belonging to the pastoral tribes on the ground that the precautions taken by Government to prevent the spread of disease had enabled them to largely increase the number of their herds. He desired that the incidence of taxation should be such as to encourage agricultural industry and discourage pastoral predilection. He therefore appointed a Committee consisting of Bowen, Hopewell (Chairman), McCallum, G. W. Dunnett and Tomlinson, to consider the subject. Owing, however, to the outbreak of war, the sittings of this Committee were delayed and were in fact never held.

Resident Bulkeley, 28th July, 1920.

Mr. Hopewell considered the question in December, 1919, and the first three months of 1920, and submitted a report on the general question of native taxation on the 28th of April, 1920. In that part of his report which dealt with the Manal Reserve, he considered that the Manal in the Manal Reserve presented, as regards occupation and location, a totally different problem from that encountered in considering the non-owning agricultural tribes in the Protectorate. The Manal were pastoralists, whose mode of life, customs and requirements differed from those of agricultural natives. They required much more land than agriculturists, and had many fewer inhabitants to the square mile.

Mr. Hopewell, 28th April, 1920.

Statistics of the Manal Reserve estimated the population at 30,000 souls, the number of horned stock at 300,000 head, and of sheep and goats at 2,000,000 head, while the area of the reserve was approximately 6,000,000 acres. The annual rents paid by the Manal amounted to £6,30,000 only. Mr. Hopewell quoted, for comparison, the case of three agricultural districts, whose total area was 6,120,000 acres, whose population was 300,000 souls, and which paid the 30% tax in lieu and gold tax.

The capitalized value of Manal stock was so large as to make the cattle stock about Rs. 600 per head, women and child, and supposing that this capital amount bound was for 5 per cent. per annum, the annual exchange of the tribe would be worth Rs. 27 per head. The total personal wealth was very small, while they paid less than one rupee each in annual taxes. It was therefore evident that the Manal did not contribute their fair share to the Protectorate revenue, and that some readjustment was necessary in their case.

In regard to the manner in which the Manal should be taxed, Mr. Hopewell observed that their nomadic habits and mode of building hut rendered the method of collecting revenue under a hut assessment a far more difficult matter than it was in the case of agricultural tribes. He also considered that any system of poll tax on adult males would be equally unsatisfactory. He therefore proposed a scheme which had been put forward by Mr. Dunnett and which he outlined as follows:—

In order to find out the approximate taxable value of the Manal, the tax should be worked out as a percentage, based on the assumed commercial value of the herd. The amount thus would be collected in the form of a cattle tax (covering sheep and goats). The average of the reserve being one million souls, the assumed cattle being assessed at Rs. 5 per head, a tax of 1 per cent. on the assessed value would produce a revenue of Rs. 250,000. This amount could be divided amongst the total number of cattle assessed, and would amount to 8 annas per head or half a rupee head of cattle. Mr. Hopewell considered that there would be considerable difficulty in counting the cattle, and suggested

SECTION VII

THE MASAI EXTRA PROVINCIAL DISTRICT

GENERAL NOTE

Masailand constitutes an Extra Provincial District under an Officer in Charge, holding the powers of a Provincial Commissioner, with two District Commissioners, stationed at Kajiado and Narok. The legislation in force in other parts of the Colony applies to the District, but the Outlying District Ordinance, No. 23 of 1911, has also been applied to it, in order to provide a means for controlling immigration from other tribes, a matter to which, as will be subsequently shown, much importance is attached by Masai religionists. The area of the District is 13,177 square miles and the population was estimated in 1925 at 55,000.[1] The density is thus 3.4 per square mile.

The Masai District contains in its more northern section a considerable area of land which ranks for agricultural or pastoral purposes with parts of the neighbouring Highlands reserved for Europeans, though it is to be noted that the rainfall here is more variable than in the central part of the Highlands. The lower parts of the District have a lower and even more variable rainfall, with the result that there is no area, conservatively estimated at a little over 3,000 square miles, which is arid and for all practical purposes waterless.[2] But the value of the large area held by the Masai is not to be judged by its agricultural possibilities, for if the Masai no longer justify the character assigned to them by history as "a virile tribe of predatory nomads," they have at all events maintained their traditional habit of life as a pastoral people, and, though there is some cultivation in the Naivasha/Ngong area and also near Ngong, this forms only an infinitesimal part of the District, and is for the most part carried out by Kikuyu immigrants on behalf of the local Masai.

It is of interest to note that in 1904 the number of cattle was estimated at only 50,000 and the sheep and goats at 600,000. This may have been an underestimate, though it must be realized that the country was still in some extent suffering from the effects of the great rinderpest epidemic of 1891, which had resulted such unmanageable results both on the numbers and the military power of the Masai. By 1914 the estimate had gone up to 600,000 head of cattle and over a million and half sheep and goats.[3] The Masai herds suffered severely in the drought of 1922 and 1924, when their losses of cattle were estimated at over a quarter of a million. But a recent estimate has put the number of cattle at over 700,000, with 800,000 sheep and a large number of donkeys. The further increase in the number of cattle is to some extent affected by the existence of fly, which is prevalent on the South Kaptumo boundary, in the extreme east, and also in the middle area, where the Kajiado and Narok Districts join. But if the present estimate of the stock is correct,

[1] Kenya Colony Blue Book, 1928, page 102.

[2] There is a summary of the physical conditions of the district by L. Jones at page 40 of Africa, January, 1939, together with a useful bibliography.

Tr Hailey G-4 (No date) 1950 FL12 Masai FL12

the Masai case, considering their small numbers, have a larger potential capital per head than any other tribe in East or Central Africa.

Practically the whole population may be said to belong to the Masai tribe, though there are a small number of immigrants, numbering rather less than one thousand in all, ninety per cent. being Kikuyu. As shown above, they are for the most part employed by the Masai in the cultivation of the small area of land used for agricultural purposes. There has been a certain amount of intermarriage, but the penetration of the country by the Kikuyu is viewed with disfavour by the Masai, and three Alien Committees have lately been established in order to consider measures for the control of alien immigration. An area of [illegible] square miles (known locally as Ongamoran) within the Masai Native Land Unit was set aside in [illegible] for "squatters" displaced from European farms, most of whom are Kikuyu.[1] But this area will remain politically separate, and it will not affect the position of the Masai as a homogeneous population.

Early records refer to the existence in Masailand of a number of Dorobo, of whom Masai tradition speaks as the original inhabitants of the country. When Europeans first came into contact with the Masai, part of the Dorobo were still leading a primitive life in the bush, while part served the Masai as herdsmen and in some cases had small herds of their own. These people have, however, now been absorbed by the Masai and are not readily distinguishable from them.

THE MASAI TRIBE

Reference will be found in the Chapter on Tanganyika to the circumstances in which the Masai tribe, as it existed in 1891, was cut in two by the conventional boundary drawn between Kenya and Tanganyika.[2] The area then left to the Masai in Kenya, now estimated at [illegible] square miles, compared with the area of [illegible] square miles now held by the Tanganyika Masai, with an estimated population of [illegible], and a density of [illegible] per square mile. The proceedings as the result of which the Kenya Masai were in [illegible] placed in occupation of their present area have had a prominent place in the controversies connected with the alienation of native lands in the Colony, but it will be sufficient to refer here to the facts as summarized in paragraphs [illegible] to [illegible] of the Report of the Land Commission of [illegible].[3] The Masai lands are now held as a Native Land Unit under the terms of the Native Lands Trust Ordinance 1938 of [illegible] and the Kenya (Native Areas) Order in Council [illegible]. There is, however, one fact which differentiates the Masai lands from those occupied by other tribes under the terms of this legislation, as does hold for the Tanganyika Masai. Whatever the judicial value of the Agreements made with the Kenya Masai in [illegible] and [illegible], it is held, in the words used by the Governor of Kenya in [illegible], that they "have the validity of a Treaty."[4] If so, the terms of the Order confirming the Agreement of [illegible] constitute a moral obligation on the Government to reserve these lands for the exclusive use of the Masai, "as long

---

[3] [illegible] page [illegible]. For fuller details see Chapter [illegible] of Administration and Political History of the Masai Kikuyu, previously referred to.

[4] Despatch No. [illegible] to [illegible]. The Agreement of [illegible] is printed on page [illegible] of the Report of the Land Commission previously referred to.

(29) Ilkiparpar are Sonjo. There is also a small group of Tindiga, leading virtually a hunters life in the Lake Eyasi basin, to whom reference was made in Section 1.[1] There would appear to have been a movement both northward and southward on the part of the tribes, who were previously contained in a very small area by the Masai invasion of the early part of the century.

THE MASAI DISTRICT

(31) The Masai District forms the southern portion of the large block of country in Tanganyika and Kenya, extending to no less than [illegible] million acres in extent, occupied by the Masai tribe, whose numbers were given in the 1952 Census as [illegible] in Kenya and as [illegible] in the 1948 Census in Tanganyika. There will be found in the Chapter dealing with Kenya Colony further reference to the tribal characteristics of the Masai, and it will be sufficient to give here only those facts which have a particular on the position they occupy in Tanganyika.[2]

(34) The southern movement of this tribe from the neighbourhood of Lake Rudolf seems to have come to an end about the middle of last century, but its sporadic but in ships penetrated as far south as the Great Ruaha River and even as Usiha in the Iringa District, whence they were driven back by the Gogo and Hehe. There were many isolated Masai raids after that time, but these were in the main carried out by Kenya Masai, whose incursions were directed towards the coastal areas on the east, and indeed took them as southern as far as Mombasa. The Masai settled in Tanganyika do not seem to have attempted a further movement of any importance into the neighbouring areas of the Territory.

(35) (36) The Anglo-German Agreement of 1890 cut the Masai country into two parts, roughly equal in area, though the population remaining under the British jurisdiction was somewhat larger than that which fell under German rule. The result was to make an effective division between the Kenya and Tanganyika Masai, and though the two sections have retained a community of racial interest, this has not extended to the political field. Such political unity as the Masai people possessed had existed largely for war purposes, and in peace time political or quasi-legal authority was dispersed among the headmen exercising control over the groups having a customary right of pasturage in particular localities. There was moreover lacking in the case of the Tanganyika Masai a motive which might have led them to identify themselves with the Kenya Masai, namely, the need for preserving their lands from alienation by Government for the benefit of Europeans. The troubles created in Kenya by the efforts of Europeans to secure possession of Masai lands[3] were not repeated in Tanganyika, where the Masai have remained unmolested in the occupation of the country they held at the period when European rule was established.

(38) The present Masai District comprises, in the north, the Loliondo area, the dominant feature of which is the vast Serengeti plain, with the extinct volcanoes which mark its southern end. In the centre, south of the Rift Wall, the plateau type of country is characterised by volcanic hill masses, which provide a number of permanent water sources. In the South in extensive flats scrub steppe, with a low and very variable rainfall.

(39) Practically the whole of the area included in the District is used only for pastoral purposes. It traditions is correct in holding that the tribe was once

An Administrative Survey of the Masai Social System

By H. A. Fosbrooke

PREFACE.

The accompanying notes do not pretense to give a 'balanced picture' [2]
of the Masai social system. They were compiled in 1939 when the writer, after 4 years' service in the Masai District of Tanganyika was seconded to study the political system and to submit proposals on administrative reorganisation. These latter are omitted from the present publication, but the chapters on History, the Laibon, the Age-Grade System, the Tribal Officials, and Clan and Family matters are presented in that order and in practically the same form as when originally submitted, and consequently refer to the position as it existed in 1939. This introduction and the conclusion are being written in 1948.

By reason of its origins this material has a heavy bias on the political side of the social organisation; the purely social — birth, marriage and death customs — and the socio-economic — the cattle culture, land usage, etc. — leave a large field of interesting material for future study. It is hoped that one result of the publication of these notes will be to stimulate those at present serving in Masailand in whatever capacity, in both Kenya and Tanganyika, to take up these untouched branches of study in addition to correcting, bringing up-to-date and noting local divergences in this and other published material.

The Masai are known, by reputation or repute, to the majority of [10]
those into whose hands the present publication will fall. Here it will suffice to say that they are a race of semi-nomadic pastoralists, of Nilo-Hamitic stock, occupying a large area of country on both sides of the Kenya-Tanganyika border. The census due to take place this month will reveal their true numbers, and perhaps the editor of News and Records will be in a position to quote an accurate figure before this appears in print. But the whole tribe probably does not exceed 20,000 [5]
adult males or [illegible] persons in all.* It has been frequently pointed out by its critics that the tribe occupied more land and has played a more important part in history than is justified by its numbers, but the same remarks apply to many strong-characteristic and virile races.

To illustrate this paper some of the numerous photographs which I [7 slides]
took during my sojourn in Masailand are reproduced, though they have perhaps suffered through time and inadequate storage; in addition those interested will find that the slides mailed to the bibliography with an accent give an adequate pictorial representation of Masai life. And finally 400 feet of 16 mm. cine film, kindly edited and 'dupped' by the Colonial Film Unit, has been deposited with the Information Officer, Dar-es-Salaam, from whom it may be obtained on loan. Of particular interest are shots

* The Director of Statistics, E.A. High Commission, has kindly supplied the following preliminary estimate figures of the Masai population: Total number of Masai in the Maasai districts of Kenya and Tanganyika — 60,000, of which 10,000 are males — Ed.

[illegible]

THE MAASAI RESERVES

[illegible]

DEMOGRAPHY

144 Population figures for [illegible] and [illegible] were estimated as follows, the [illegible] figure including an estimated [illegible] Samburu:

	Kenya	Tanganyika	Total
[illegible]	[illegible]	—	[illegible]
[illegible]	[illegible]	Samburu: [illegible] Ngorongoro: [illegible] [illegible]	[illegible]

The [illegible] census gives the following figures:

		Male	Female	Total
Kenya	[illegible]	[illegible]	[illegible]	[illegible]
	[illegible]	[illegible]	[illegible]	[illegible]
	[illegible]	[illegible]	[illegible]	[illegible]
	[illegible]	[illegible]	[illegible]	[illegible]
	[illegible]	[illegible]	[illegible]	[illegible]
		[illegible]	[illegible]	[illegible]

* Estimated.

		Male	Female	Total
Tanganyika Territory	[illegible]	[illegible]	[illegible]	[illegible]
	[illegible]	[illegible]	[illegible]	[illegible]
	[illegible]	[illegible]	[illegible]	[illegible]
	[illegible]	[illegible]	[illegible]	[illegible]
	[illegible]	[illegible]	[illegible]	[illegible]
		[illegible]	[illegible]	[illegible]
Total for Mandated		[illegible]	[illegible]	[illegible]

This shows only a small increase over the [illegible] estimate for the Kenya Mandated, when 10,000 Swahili are deducted, but it doubles the previous estimate for the Swahili and shows a substantial increase in the Tanganyika Mandated.

The livestock estimates for the Kenya Mandated are:

	Cattle	Goats and Sheep	Donkeys
[illegible]	[illegible]	[illegible]	[illegible]
[illegible]	[illegible] to [illegible]	[illegible]	[illegible]

The figures for cattle among the Tanganyika Mandated are [illegible]* but these must be underestimated. They vary in fact from about [illegible] to [illegible] according to seasons and other factors.*

The total area of Mandated to Kenya and Tanganyika is about [illegible] square miles or [illegible] acres (10,000 square miles or [illegible] acres in Kenya, and [illegible] square miles or [illegible] acres in Tanganyika). After deducting [illegible] square miles or [illegible] acres from the Kenya Land Unit as being unsuitable because of bush or tsetse fly, the Kenya Masai have about three acres per head of stock which is shared with sheep and goats, whereas in country such as Baringo cattle alone require anything from three to five acres per head, owing to the low rainfall, poor grazing, scarcity of rivers, and frequent droughts. Their Land Unit is also a Game Reserve.

Sources: Swaffield, (1918); E.A. Census, 1948.

PHYSICAL ENVIRONMENT

At the height of their power in the middle of the [illegible] century the Masai occupied a stretch of country which covered some [illegible] miles from north to south, and, at its widest, [illegible] miles from east to west. The northern limit was approximately Lake Baringo (now small lake), [illegible] miles south of Lake Rudolf; the southern, Longido, near

* Information from Mr. [illegible] Tuderman.

13.Huntington E-4 (no date) 1953 FL.12 Maasai FL.12
Agricultural Masai

In 1902 the D-Tiemes numbered about 2,000 (2,400 according to the 1948 Census) and though they are of Masai stock, being descended from a Laikipian section called D-Ongolo, they have adopted a variety of refugee including Kamasia, and become cultivators. According to one Dilmont they had originally four villages on the south end of Lake Baringo, but two were deserted on account of Masai and Suk raids, and some of the inhabitants, having lost all their cattle, took refuge on Dilmont Island in Lake Baringo. They are expert swimmers and possess canoes, though one Dilmont was seen in 1947. Their dwellings are round huts with rather high pitched and somewhat convex thatched roofs, and walls of posts and sticks. These are crowded into two permanent villages known as "Kiongo Kubwa," and "Kiongo Ndogo" in the Ngeleh valley a few miles south of Lake Baringo; the closely packed huts almost touch each other, and the well-walled grounds are surrounded by strong palisades.

In general the D-Tiemes keep as close as they can to the dress and customs of the pastoral Masai; they have circumcision and dances and other ceremonies, and practice the "lmo-lore" system of the pastoralists, though without the monarch. Today they have some 100,000 acres of poor land, most of it unfit for cultivation, but they have acquired, since the establishment of British rule, some 15,000 or more head of cattle, and 30,000 goats and sheep, thus achieving in part the ambition of all D-Ongolo to become cattle people again. In the time of Thomson and Teleki, however, Kiongo was an important station on the caravan route, and we Dilmont noted that they had a large extent of cultivated land. This was divided into blocks (the seat of three to four miles square) which were interrupted by irrigation channels bringing water from dams across the river Ngeleh. This system was still working in Dundas's time, who says that the opening of the main ditch was performed with the "utmost of a sheep at the mouth of the ditch." Besides agriculture, the D-Tiemes fished and hunted, using the bow, and spears of Suk and Turkana types.

It is possible that the fishing group called D-Mdo who live on the east shore of Lake Rudolf is to be classed as D-Ongolo.* They subsist on a diet of fish alone which, when Teleki and von Höhnel saw them in 1888, had produced no ill-effects, but it seems now to have resulted in considerable physical degeneration, and in the appearance of rickets in all members of the group. There seems to be a good deal of Gallla blood in them.

The D-Arusa round Mount Meru are a large tribe of agricultural Masai, originally of Burka stock, but now accepted by the pastoral Masai as worthy of recognition as a group which can pay and receive cattle for compensation in cases of homicide. The Ilangoyo in Southern Mandland are also to be classed as agricultural Masai.**

SOCIAL ORGANIZATION AND POLITICAL STRUCTURE

Social Organization

Life Cycle

From birth to circumcision a male is a boy, *el-ayiok*. At circumcision* he enters an age-set and becomes a warrior, *el-moran*, "one who is circumcised," and may associate with uncircumcised girls. At the *el-gedei* ceremony he becomes an elder, *el-moran*. Warriors may marry when they become senior warriors. After the *el-gedei* the newly made elders attend to their family concerns, and get wives

* E.g. R. Dundas (1911, 71), see 48-49.
** E.g. Lyon and T. G. Fyfe, "The Arusa," (1911, 1947), see Höhnel, 91, pp. 196-98.
* The people known as Kwafera in northern Tanganyika are not Masai, but people of Burka stock who have adopted them.
* There is some uncertainty as to the age at which boys are circumcised. Hollis gives the limits as 10-15 years, Kulmann gives the lower limit as 16 or 17.

Kikuyu FL10

The information collected directly was supplemented by the replies to two questionnaires issued by the Medical Department to district medical officers, medical missionaries, chiefs of tribes and others interested in the investigation. One questionnaire dealt with the dietary customs of natives and the other with the incidence and etiology of ulcers.

II.—FIELD WORK.

(a) Dietary Customs and Incidence of Disease in the Kikuyu and Masai Reserves.

Dr. J. W. Foster was sent out from the Rowett Research Institute to carry out this part of the investigation, and Dr. J. C. J. Callanan, of the Medical Service in Kenya, was specially detailed to work with him for the first five months.

The two reserves chosen for the investigation were the Kikuyu and Masai, the choice being made on account of the fact that the reserves adjoin while the dietary customs of the tribes are very different, the Akikuyu* being almost exclusively vegetarian and the Masai chiefly carnivorous.

The two Reserve areas were visited alternately during a period of over a year and a half, each trip occupying two or three months. Samples of all foodstuffs in common use were collected and despatched to the Rowett Institute for analysis. The samples consisted of articles of diet in the raw state, cooked foods, edible earths, salt substitutes, and natural mineral waters used in cooking.

A physical examination was made of 6,349 Kikuyu and 1,546 Masai† adult natives of both sexes and all ages. The examination was made under eighteen heads, including stature, weight, chest, abdomen and calf measurements; presence of anæmia; condition of teeth and gums; general physical and muscular development; strength as indicated by the dynamometer; presence of hernia, splenomegaly; ulcers.

A similar examination was made of 2,500 Kikuyu and 254 Masai children. The special object of this examination was to compare the tribal incidence, during the growth period, of osseous deformities, dental caries, periodontitis, anæmia, and general signs of malnutrition.

The subjects examined for physical condition were taken at random from the healthy section of the community in all parts of the Reserves. Great care was taken to exclude any sick native who presented himself. Apart from this, no selection was made, and the records may be taken as representatives of the average native of the Reserves.

An estimation was made of the diseases prevailing in the two tribes. Hospital returns were analysed, but, as it became apparent that, for

* The prefix "A" in Akikuyu has a collective sense, the term "Akikuyu" referring to the tribe as a whole, while the term "Kikuyu" has only an adjectival significance.

† It should be noted that the estimated populations of the Kikuyu and Masai Reserves at the end of 1929 were respectively 796,934 and 48,547.

175 but so was the absolute reign of the Masai. The organiza-
175 tion of the sections was much broken up. Many pastoral
*237 Masai had lost their herds and had taken to hunting or
cultivation. Some had been taken in by surrounding
tribes and others taken as captives by them. A great
many had died or been killed in the combination of famine,
• [161] rinderpest, smallpox, and civil war. Therefore the
population of Masai in Masailand around 1900 must have
been quite low. Its lowest ebb probably came around
1892 or 1893, and there had been some recovery in the
next decade. Some Masai had started to rebuild their
[648] herds by stealing cattle. Others bought them by
[921] working for the Germans helping to subdue other tribes.

175 It is uncertain what the fate of the Masai would
648 have been without the intervention of the Europeans.
Those most afflicted with Masai-itis insist that the
Masai were recovering rapidly and that they would have
risen to greater power but for the Europeans, who held
them down and took their land. Those on the other side
say that the Masai were a dying race and that only the
protection of the Europeans enabled them to maintain
their way of life. The truth doubtless lies between the
extreme views. Even Hollis (1905) who was certainly not
anti-Masai felt that they would have to alter their way
of life if they were to survive.

175 • 164 In terms of total population the Masai have greatly prospered under European administration. It has been estimated that at the peak of Masai power, before 1890, the total population of Masai was around 45,000 (Sivart, 1962). By the mid 1920's they had recovered from their series of disasters and their numbers were estimated at about 50,000 (Jackson, 1938). The census of 1948 gave the total Masai population as 107,309 (Fosbrooke, 1948). The most recent census places the population at about 117,000.

175 648 Most of the Masai prosperity in the 20th century has taken place under the English administration. In 1891 the boundaries of the German Territory of Tanganyika stopped short of what is now Tanganyika Masailand, but it was included in the German "sphere of interest" [65] (Kiepert, 1891). Subsequently, apparently because there were so few Masai living in Masailand following their multiple disasters, the Germans created a Masai Reserve that was mostly south of an east-west line through Arusha. This division left the Ngorongoro Highlands, the Loliondo area, and the highlands near Eastern Masailand free for European settlement and displaced the Masai living there. [131] This action further scattered the remnants of the Masai, some of whom moved north into Kenya and others south into

21:Huxley G.T.-5 (no date) 1940 FL.11 Lon
Mag. FL12

million head of scrub cattle, and the one sheep and goats. They *could* export fat steers and hides, but have done next to nothing to improve the quality of their animals. This is because they do not need the cash. There are old men living in mud huts with little but ear-rings, a spear and a blanket who could at any minute realize several thousand pounds for their cattle. Scarcely one of them could not afford a motor-car if he wanted one, probably a Jaguar at that. The plain fact is they do not want motor-cars, or beds, or kitchen sinks, or radios, or refrigerators, or washing machines: they just want cattle, which they have, and which the processes of nature will increase for them without their having to do any disagreeable work.

It is an impasse. The whole machinery of modern society, modern trade, modern development, has been halted by the Masai's refusal to keep up with the Jones's, or the Kennons in this case. It is like a great Britannia aircraft grounded by a midge in the works. Modern civilization runs on avarice as cars on petrol, and if there is no pump where you can fill up with avarice, you simply stay where you are.

But even the Masai are not really free of avarice: it merely takes a different form. If they do not want bicycles and trousers, they do want more cattle, and this has led them into a great error. Instead of rejecting everything the West offered them, they accepted the hypodermic syringe of the vets. First of all the vets put an end to rinderpest, and then, rather less successfully, dealt with various other diseases that were keeping their herds in check.

No doubt it would have needed superhuman self-denial on the part of the Masai to have rejected this magical means of ending the periodic epidemics that had wiped out all but a remnant of their cherished herds. Yet these were the means by which nature had kept herds and habitat in balance. Vegetation, controlled by constant factors like rainfall and soil structure, cannot multiply as creatures of the animal kingdom can, and do. The fact remains that to accept the vet's syringe was fatal to the Masai, and to offer it to them, as the Government did, without also insisting upon some means of keeping down the livestock population, was an act of remarkable

S: Bernardi E, M-4 (no date) 1955 FL.12 Masai FL.12

On the whole, these two authorities stress the linguistic unity of all the Masai. 197

The great majority of the Masai are pastoral, only very few tribes having taken to agriculture. The pastoral tribes follow a semi-nomadic way of life. "They move", writes Lord Hailey,* "with their herds in order to avail themselves of the seasonal variations in water supplies, so that in effect they practise a system of rotational grazing". The same writer,* reports "a recent estimate" of Masai herds in Kenya which puts "the number of cattle at over 700,000, with 800,000 sheep and a large number of donkeys". For Tanganyika he gives no figure. The above estimates show clearly enough how the attitude of the Masai to cattle is a prominent feature of their life. To own cattle is a privilege obtained through initiation, and large herds are a sign of outstanding social status. Cattle are the main economic interest and investment for the Masai.* 233 [20] 1[3] 425 [24]

The total population of all the Masai may be reckoned at about 150,700. The 1948 census of Kenya's population (see Bibl.) gives for the Samburu an estimate of 30,000, and the following figures: Njemps 5,600, the other Masai 67,300. In 1951 the Tanganyika Masai were reckoned as 52, 100. [27] [26]

* * *

Under the present political situation, the Masai are not administered as a single unit, for they are divided into two sections by the border of Tanganyika Territory and Kenya Colony. 651

In Tanganyika the Masai form one of the four districts of the Territory's Northern Province (the Masai District). In Kenya the main group inhabits the reserve adjoining Tanganyika Masai District, and constitutes the Rift Provincial District (Masai District) of the Colony. The other group (Samburu and Njemps) is incorporated with the Rift Valley Province (Samburu and Baringo Districts), and partly with the Northern Frontier Province. The geographical separation of the Samburu from the other Masai is the reason why the Samburu were considered, and are still considered, as a non-Masai tribe. But, as Beech remarks, they are true Masai. The splitting of Masailand and the separation of the Masai were made 1[3] 1[4] [01] 115

S: Bernardi E, M-4 (no date) 1955 FL12 Masai FL12

ter", for Sims, "is by no means clear, but there exist vestiges of a ceremony now practised in conjunction with fertility rites, etc., whereby the senior elders retire and hand over the government to the junior elders". Unfortunately, no details of such "vestiges" are indicated, nor is a similar ceremony mentioned by any other authority. CL1 CL4

In 1909 Fosbrooke compiled a census of the class- and sub-sections being some of the Kisonga. Above we reproduced the considerable figures of the age units; it is now of interest to give the figures of the same census for the age-classes. CL1 CL3

	LAIKI	Kisonga	Sumaiwa	Ingumbai	Longidu	Total	
Classes	0/1 LOGOMI	1	–	–	–	1	Old men
	1/2 MEK	2	1	–	1	4	
	2/3 ALA	14	13	9	22	57	
	3/4 ITI	30	32	29	30	120	Senior Elders
	4/5 EYO	49	48	34	42	213	Junior Elders
	TALA	194	194	69	119	576	

The above totals should be compared with the total of the age-units mentioned, which are as follows:

TALA	193	189	66	124	572	Initiates

A special officer is elected at the spokers. He is called *el-lo-ravaign*.[1] His functions are not very clear. He is described by Fosbrooke[2] as having "no duty", though he is held in great CL1 CL4

[1] The o[illegible] one refers evidently to the elder's decorations. The *ravaign* are the ear-rings worn by the elders.

[2] Fosbrooke, l. c., p. 65.

division to necessitate or render advisable a departure on this total from the general policy to be pursued in dealing with the tribe as a whole.

The Tribal Divisions

The Tribal Divisions of the Masai as they are recognized for the purposes of the administration of the tribe are as follows:—

Purko

The Purko is the largest and most important division. They number about 10,000 and of these some 10,000 come from Loikipia. There are rather more than 5,000 Morans, who inhabit five large villages. The names of the "Sirite" are I Kimwani, I Sambu, I Ainan, I Rupuli and I Ilpiri. In 1918, the Kimwani Purko Morans decided to divide, and while one part retained the name of Kimwani, the other adopted the name of "I Kidonet." In 1937, the Purko were estimated to possess 70,000 head of cattle, 1,000,000 sheep and 4,000 donkeys. They live in the country known as Ngarua and in Ol-Doinyo.

Loita

The population of the Loita Division is about 4,000 of whom some 700 are Morans. This division formerly lived near Ngong but when Sendeu, their mulkiwanan was quarrelled with Lenana, they moved into German territory returning subsequently to the Loita Hills where they now are. The Morans "Sirite" are known as I Pangwa and I Kimwani. The Loita are estimated to possess 40,000 head of cattle, 200,000 sheep and 700 donkeys.

I Chopuk

A small division known as the I Chopuk inhabits the same region as the Loita. They number about 800 of whom 40 are Morans. They are said to possess 1,000 head of cattle, 10,000 sheep and 100 donkeys. A small number of I Chopuk also live in German East Africa.

Siria

The members of the Siria Division generally inhabit the Loita Country and they recognize Sendeu as their Laiboni. Their population is estimated at 800 of whom about 60 are Morans. They possess 6,000 head of cattle, 10,000 sheep and 200 donkeys. A small portion of the Siria have amalgamated with the I Ole Kiteu.

Siria

The Siria Division also recognizes Sendeu as Laiboni. They inhabit the Ol-Doinyo country, number about 1,200 of whom 80 are Morans, and possess 45,000 head of cattle, 30,000 sheep and 50 donkeys.

I Dumat

The I Dumat have one location with Purko by whom they were recognized some years ago. They are to be found on the Loita Plains and number 900 in all of whom 60 are Morans. They are estimated to possess 6,000 head of cattle, 30,000 sheep and 100 donkeys (see p. 87).

Kaikenyiku

The members of the Kaikenyiku Division number 2,000, of whom 200 are Morans, and possess 60,000 head of cattle, 200,000 sheep and 2,000 donkeys. They inhabit the country known as I Hill and Moran, and the neighbourhood of Mount Suswa. The "Sirite" of the Morans are named I Rupuli, I Pangwa and I Kimwani.

I Ole Kiteu

The I Ole Kiteu Division inhabits the country near the German border south of Lake Magadi. The population numbers 1,200 of whom 80 are Morans, and they possess 15,000 head of cattle, 80,000 sheep and 100 donkeys. The Morans are divided into two "Sirite" both known as I Kimwani.

Ngurumans

The Ngurumans form a survival of the old agricultural Masai, but they have discontinued agriculture and now live in the same manner as the pastoralists. They inhabit the country near the south of the Uaso Nyiro River. They number 400, of whom 40 are Morans, and possess 1,000 head of cattle, 10,000 sheep and 50 donkeys.

Kwapuo

The Kwapuo number 2,400, possess 45,000 head of cattle, 175,000 sheep and 500 donkeys. Their Morans number 180 and are divided into three "Sirite" named I Kiteu, I Tetaia and Seuru, and they inhabit the country between Kajiado and the German border.

The Sighiroi of the Sighiroi inhabit the country to the neighbourhood of the Ngong Hills and Ol Doinyo Rashi. To this division belong the subdivisions of the 2 Inter Clans of which Sogai is now the chief. The Division is estimated to possess a population of 1,000 of whom 100 are Morans, 40,000 head of cattle, 40,000 sheep and 300 donkeys.

The 2 Dale Lekerrik came from Lekiyan in 1910 and are sometimes known as the Ewaso Ronyo. They have a considerable admixture of Kikuyu blood in them. They inhabit generally the neighbourhood of Ol Doinyo Rashi and their population is estimated at 700, including some 70 Morans. They are said to possess 5,000 head of cattle, 20,000 sheep and 70 donkeys. Their Morans are divided into two "Sirits" namely 2 Tumes and Sogai.

The Kaputei are to be found in the neighbourhood of the Ewaso Ronyo. Their population is estimated at 2,000 including 170 Morans, and their possessions at 30,000 head of cattle, 100,000 sheep and 400 donkeys. Their Morans are divided into four "Sirits" whose names are 2 Sokomo, 2 Sogai, 2 Kidonet and 2 Sogai.

The Sighiroi of Lekedirok inhabit the country to the north of Kilimanjaro, which country is owned by the Engare Sonyo, Kidotiro, Ewaso, 10 of Tumes and Sonko streams. The population of this division is estimated to number about 2,000 of whom 100 are Morans. These are divided into two "Sirits" namely 2 Kinti and 2 Sogai. The live-stock possessions are said to number 40,000 head of cattle, 170,000 sheep and 300 donkeys.

In addition to the Masai, there are considerable numbers of Wandorobo ("2 Tumes") living in the Masai Reserve. These numbers are probably not less than three or four thousand, and many of them possess considerable herds of cattle, and live the life of ordinary Masai, from which it is difficult to distinguish them. They may be conveniently divided into two classes, namely, those who live in the bush and forest, and those who possess cattle. The former possess little or no live-stock, and subsist almost entirely upon wild animals and honey, while the latter live in villages and subsist only to a very limited extent on game.

The former are to be found mainly in the neighbourhood of the Rift, but small parties of them are also met on the Uaso Nyiro, on the Lower Mara River, along the Sotik border, and in the Trans-Mara region. They live on bee nibbles and the smaller game animals, in rough shelters in the forests, or in the huts in some of the Masai villages.

The latter are to be found on the Uaso Nyiro, in the neighbourhood of Ol Donyo and Ol Doinyo Rashi, on the western bank of the Mara River, and in the Mara country. In all, they probably number about 1,000.

There exists in the reserve, a special tribe of outlaw, somewhat similar to the Wandorobo, called 2 Kwenes, who dwelt into weapons, but are treated as tolerated, and are not allowed to marry Masai women.

To complicate, the Masai are a native, conservative, clothed people, nominally governed by Council of Elders, who elect themselves to be hereditary to deal with the idle body of warriors whose wives have not disappeared, but who are still sufficiently industrious to render sufficient the wants of their wives. They have been concentrated in one area, where they have secured enormous herds of cattle of a poor quality, and countless sheep. No suitable means of employment has as yet been found for the males of the tribe as a whole, though they are experts in the care of stock, and have possessed fighting qualities of a savage nature, which spread the terror of their name far and wide. They have considerable latent powers of organisation, endurance and ability, but these are largely discounted owing to their unreliability; they have always evinced that it is in their best interests to be loyal to the British Government, and have never been responsible for any serious disturbance, being too proud to work, and rich enough to disregard fame, they are probably the most backward educational native tribe in the East Africa Protectorate.

"The political and military organisation of the Masai has been so fully described by the various travellers, notably Mr. Thomson, who have made it their study, that it is unnecessary for me in this report to reproduce the information which, without his greater knowledge than I can pretend to possess, have already supplied on this subject. There seems, so far, but little hope that this wild people will, as a whole, be weaned from their predatory mode of life, and induced to become peaceful subjects. Though a few of them settled at Ngong Hills have recently begun to take to agriculture, under the supervision of the local officials.

"The total number of the Masai in the Uasin district, including the Kamasians, is estimated by Mr. Cornwallis at 30,000. There is one settlement at Ngong Hills, include 600 "Ghedes" or warriors under 30, commanded by "Laplanas," and about 4,000 old men, women and children."

In another part of this report the Acting Governor writes as follows:—

"Mr. Gibbons, who is in charge of Kibwezi, introduced the practice of employing Masai women to carry the mails, and they have proved, I believe, very satisfactorily, covering the 180 miles of the third stage in five days. The average time now taken to transport the mails from Machakos to the Kibwezi Fortin, a distance of 280 miles, is twenty days, or about 14 miles a day. The weight of each load of mails is 30 lbs."

In a subsequent passage, dealing with the slave trade, Mr. Arthur Hastings writes:—

"The trade in Uganda is confined to the Sudan of Gina, and is chiefly to Masai women and children.

"The origin is as follows:—When the Masai of Naroo Moru, near Kenia, were decimated about four years ago by an epidemic of smallpox, following upon a severe cattle plague, which alleged that warriors to go long distances to raid for cattle, and thus have their trade almost extinguished, the Kikuyu people, their hereditary foes, fell upon them in overwhelming numbers, massacring their old men and carrying off their women and children as slaves. These they are now selling at low rates, having more of them than they want, to local Arab or Swahili middlemen, who, driven by our patrolmen from the coast, can only carry on their trade with safety in inland districts as yet unoccupied by us, and who resell the slaves thus purchased at a profit to the cattle Europeans throughout eastern Uganda, these latter people being all Germans too, and therefore requiring to be supplied with such slaves as they may need from other tribes.

"Some of the Masai girls are kept by their Swahili purchasers as concubines, and these, when they have learnt in a year or two enough Swahili to pass in the Swahili from as roads women, will go down with their masters to the coast, where a few of them (not having been children) may be secretly sold to other Arabs or Swahilis, but Mr. Sub-Commissioner Cornwallis, who knows Uganda well, assures me that they usually all remain in Gina, and further whether fifty of them in a year even leave it."

Referring again to the activities of Swahiles, Mr. Arthur Hastings wrote:—

"Of late there have been symptoms of unrest among the Masai, which have made it necessary to keep a special watch on them. Swahiles, Chief of the Lake division of the race, who speaks sometimes in English and sometimes in German, tactfully, has been endeavouring to persuade his brother Lenana, the Chief of the Masai of Naroobo, all of them on one side of the border, to join him in a general movement against the Germans in Kilimanjaro, who recently chastised a local tribe of Masai, the Wa-Arabs, for the murder of two German missionaries.

"In anticipation of trouble in this quarter, I sent reinforcements to Naroobo, and the simultaneous arrival of troops from Uganda at Naroobo and at Ngong Hills from Machakos seems to have induced Lenana to decline Swahili's proposals, which, though primarily directed against the Germans, really aimed at a general rising against all European control."

With regard to the population of the Boers as a tribe, it seems to have been [illegible] [illegible]

[illegible]

[illegible]

[

[illegible]

Prior to the meeting, Mr. Dalby visited the Cache Creek Indian Reserve and several of the adjoining farms and obtained the following information. The Cache Creek Band of this tribe numbered [illegible] and [illegible] souls, and had two or three hundred [illegible] head of cattle and 30,000 sheep and goats. [illegible] head of these cattle were in the habit of grazing on land belonging to Captain Gregory, who received rent in kind in return for the use of [illegible] head of cattle, which was allowed the privilege without payment. The remaining [illegible] or [illegible] cattle were for the most part in the Indian Reserve.

[illegible]

The two reserves assigned to the Cache Creek Band in February, 1861, were represented by a strip of absolutely bald and stony soil [illegible] of adjacent farms belonging to Captain Gregory which would [illegible] and [illegible] one quarter [illegible] of acres of [illegible] acres. The Band were informed that, when the reserve had been allotted to them, they could expect the questions of boundaries to definitely settled. They were also given to understand that, in lieu of [illegible] acre, they would be [illegible] a [illegible] of [illegible] head of [illegible] cattle on every head of [illegible] cattle, sheep or goats.

[illegible]

In July, 1861, the Provincial Commissioner, Ashcroft, reported that the [illegible] had occurred between Chief Lorenzo and the boundary Lorenzo, Well-known, leading man in the Bonaparte, [illegible] had been [illegible] Chief [illegible] the Bonaparte Indians who is now [illegible] at Ashcroft and had [illegible] considerable influence. Charges of [illegible] had been brought against Wellcome, with the result that he promised [illegible] to move, with the other Bands, from Lorenzo into the Bonaparte Band Reserve. The following [illegible] a [illegible] arrangement [illegible]. It appeared, however, that such a [illegible] would be the cause of bitterness between the Cache Creek and the other Bands, who have little in common, and it was decided to hold the matter over, at any rate until the Band Reserve was an accomplished fact.

[illegible]

In May, 1862, the attention of the Secretary of State was requested to an exchange of land held by Captain Gregory in the Bonaparte Province for an area in the Lillooet District. Captain Gregory was willing to exchange 10,000 acres, to be used for an extension of the Cache Creek Band Reserve, for 30,000 acres on the Lillooet District. The Secretary of State approved this arrangement in June, 1862, and the Provincial Commissioner, Ashcroft, was instructed to take steps to carry out the extended Cache Creek Band Reserve.

A description of the Cache Creek Band Native Reserve was accordingly drawn up and read as follows:—

"The reserve is divided into three parts:

"No. 1. Commencing at the point where the Yalorm Ditches Service Road crosses the Bonaparte (or Thompson) River the boundary follows the right bank of this river down stream to the junction with the Bonaparte (or Fraser) River; thence along the left bank of the Bonaparte River up stream to the point where it is crossed by the Yalorm Ditches Service Road; thence along this road to the division of Ditches Service to the point of commencement.

"No. 2. Commencing at the point where the Bonaparte River is crossed by the Yalorm Ditches Service Road the boundary follows that road to the division of Ditches to the most southerly corner of portion L.O. 487; thence in south-westerly direction along the eastern boundary of L.O. 487 to the intersection with the eastern boundary of L.O. 488; thence southerly and westerly along the eastern and southern boundaries of portion L.O. 488 to the Bonaparte River; thence along the right bank of the Bonaparte River down stream to the point of commencement.

"No. 3. Commencing at the most westerly corner of portion L.O. No. 488 on the Yalorm Service Road the boundary follows the western boundaries of L.O. 488, 489, 490, 491 in a north-westerly direction to the most northerly corner of the latter (which is also the western corner of L.O. 492); thence in a south-westerly direction along the western boundary of L.O. 492 to the Bake River;

(power)

[illegible]

[illegible]

[illegible]

The total number of population, given in Table, [illegible], are as follows:—

Question No.	Name of Districts	Population	Hindus	Muslims	Sikhs	Jains	Parsis
[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

[illegible] women, acting on their guardians and instructions. But after the period devoted to family matters the newly made elders also start thinking about their prestige. Thus, at the moment, the Dwari are responsible for both ages of women, Kiwuki and Mwiriko, yet the Dwari are already engaged in the preliminary ceremonies, endangers and explosis, of the future women. This means that under the age grade system, two generations of elders are responsible for two generations of women for a short time (note overlap on chart). But the elders who shoulder most political responsibility are the 1 group or guardians of the main body of women. The matter is by no means clear, but there exist vestiges of a ceremony now practised in conjunction with fertility rites, etc., whereby the senior elders retire and hand over the government to the junior elders.

So it should come more to account that after his service as a warrior a Mawi does not settle into a dead level of elderhood. The different generations keep themselves aloof in such matters as deputations to the Lathen (though at times they combine) and to the meetings preceding and ceremonies following such deputations. A modern tendency to be noted is that when ranged at settle matters each generation will rank and act by itself. It is natural that men of equal age should associate, but the age grade system provides a clear-cut means of providing for this.

[illegible] The following table, compiled in 1936, gives some examples of the distribution of population amongst the then existing age-grade generations. It is probable that there were a few more Nyangati and Lathen than the table indicates, but that they had been exempt and omitted from the tax-registers which were used as the basis of enquiry.

[illegible]

Distribution of Population by Generations.

	Kiwuki.	Dwariwuki.	Nyangati.	Lathen.	Total.
Nyangati ...	1	—	—	—	1
Lathen ...	2	1	—	1	4
Dwiriki ...	10	13	6	20	47
Dwari ...	30	32	15	30	108
Dwariki ...	40	40	30	43	213
Total Elders ...	124	136	60	113	433
Kiwuki ...	43	120	30	200	493
Mwiriko ...	41	30	11	34	116
Total Women ...	159	150	40	234	609
Grand Total ...	267	300	130	347	1,042
% Women to Total ...	60.0	50.3	42.3	67.5	57.9

The two most striking facts that emerge from this table are that more than half the adult male population were at the time women, and that the Mwiriko or left hand age formed only a quarter of the women population.

[illegible] The basic function of the age grade system is doubtless military, and now that the necessity for maintaining a standing army has been removed it ought be thought that the early demise of the system is an object to be desired and encouraged. True, modern conditions make

[illegible] number of women available; as times a poor relation will pass to a poor [illegible] with a richer one; again, mothers and mothers-in-law and [illegible] brothers' wives are frequently included, and numerous married women are found staying on with their fathers. Thus a commonly arranged 'pair' is seldom found in practice.

The practical effect of this system is that a Shaw elder attempts to make a constant succession of wives, marrying new ones to replace those who depart with their sons. As there are no unmarried adult women amongst the Shaw, this means that until old men take to wife girls only just past the age of puberty. As such girls have previously been accustomed to the companionship, both sexual and social, of the young, it is little to be wondered at that they frequently run away, or attempt to run away, with their erstwhile companions. The elders have no idea of preventing this by making the girls' married life more attractive than their previous one, their only remedy is force.

The two primary motives for polygamy are the desire for children, and the necessity to have women to tend the cattle. There is little sexual jealousy amongst the Shaw; within the aiguam the wives are communal to all aiguamen, and an aiguamen known to be the father of one's child is regarded as a special friend. Intercourse between men of one age and the wives of another is normally prohibited, but its extensive practice is acknowledged by the Shaw, and is fact receives general connivance. Concerning the economic motive for polygamy, increasing herds necessitate more women to tend them, and at the same time offer the means of obtaining such women. But that the actual dowry is heavy — usually three heifers and a bullock — but a man prefers to marry off his daughters to a rich elder, rather than to a poor man. Thus economics and sociology are closely linked, and action in one sphere will have repercussions in the other.

The extent to which polygamy is practised can be judged from the following table —

Distribution of Wives amongst Adult Male Population.

	Kilinga		Ilemotoo		Engaremati		Longido		Total	
	men	wives	men	wives	men	wives	men	wives	men	wives
Total unmarried	102	—	120	—	50	—	121	—	493	—
One wife	43	43	42	42	50	50	124	124	259	259
Two wives	40	80	40	80	25	50	48	96	153	306
Three wives	10	30	12	36	11	33	19	57	48	156
Four wives	6	32	6	24	5	20	1	4	28	80
Five wives	1	5	2	10	1	5	—	—	4	20
Over five wives	—	—	—	—	—	—	4	28	4	28
Total polygamists	60	—	60	—	32	—	81	—	237	—
Total of men and women	235	233	243	244	139	138	346	350	993	993

These figures were obtained by reading through tax registers to groups of elders, who supplied the information. The number of wives shewing in the registers were not revealed to them, and it was noted that in many cases the numbers given by the elders exceeded those recorded in the books.

The percentages to be drawn from this table are of special interest when compared with another table. For this reason they are tabulated below, in conjunction with those of the Dorobo, figures from Brown and Huntt's "Anthropology in Action", page 68.

Marriage Statistics.

				[illegible]	[illegible]	
Unmarried men	...	...	...	[illegible]	[illegible]	of adult
Men with one wife	...	...	...	[illegible]	[illegible]	male
Men with two or more wives			...	[illegible]	[illegible]	population.
Wives for every 100 married men			...	[illegible]	[illegible]	

Two points of interest arise from these figures. The first is the much larger proportion of unmarried men amongst the Masai. These fall mainly in the younger class, as the following table shows :—

Marriage of Masai.

	Kilonge	Sonniere	Engarenaut	Longido	Total
Total women	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
Total married women	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
Percentage married	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

The other interesting point is that one would expect both the percentage of polygamous marriages to total marriages, and the number of married women per 100 men to be much higher in the case of the Masai than the figures actually reveal. The reason for this lies in the number of dependent women not classified by the Masai as wives. The first table shows that for 100 adult males there are only [illegible] wives, but census figures show a preponderance of females over males, and the [illegible] males probably represent at least 1,200 adult females, the balance being made up by mothers (with husbands still alive) living with their sons area, deceased brothers' wives with male issue, (not therefore taken to wife), etc.

In one area the distribution of the women (wives only) amongst the ages was worked out; it was found that there were approximately 2 wives to every Dwati, 1.5 to every Dareto and 0.5 only to every Kisale.

Although it was found that on an average each gate pays only four teeth, the probability is that there are usually more than four bots to a gate, for those moran who pay tax but do not possess a bot are thought to be more than offset by those women who do possess a bot yet pay no tax. The number of cattle to each gate were examined on the Longido area, with the results shown in the table below :—

/[illegible]/

[illegible]

0.00 The future of the Maori People. -- Weighing the effect of the people-preserving and people-destroying forces. -- Polygamy. -- Nutrition. -- Fertility. -- Child mortality. -- Free love. -- Organization. -- Work. -- Epidemics. -- National pride. -- Clash of the culture of the Maori with that of the Europeans. -- The incompatibility of the two here the Maori. -- Harmful consequences of the improvement. -- Difficulty of becoming missionary.

[illegible] In order to make a prognosis about the future of the Maori people it seems necessary, first of all, to weigh the people-preserving and people-destroying forces established in the people, in its character and customs, and then to observe the phenomena that appear which the Maori meet the Europeans. We have many examples of the fact that polygamy does not promote an increase in the population to the extent that monogamy does as a rule. As the reason for this phenomenon one finds an accumulation of wives in the hands of the wealthy, and, as a consequence of that, celibacy for lack of women among very many of the less well-to-do and among the poor. It is obvious that under such circumstances polygamy leaves very many women neglected. But it is different among the Maori. For here there is such a surplus of women -- perhaps in part again as a result of polygamy -- that no man remains celibate. In fact the possession of only one woman is an exception. Hand in hand with this goes the not so unequal distribution of property; in practice there are scarcely any poor people. Another reason to which /[illegible]/ the decline in population among many polygamous peoples is attributed is that polygamous marriages as a rule are relatively poorer in children than monogamous ones. This objection is not to be taken into consideration here either, for we have seen that the fertility of the Maori women is very great. Yet, in order fully to consider the polygamy of the Maori in its economic effect, we must observe the milieu in which it exists. The polygamous household of the Maori may be compared to a work company, to which the property, theoretically belonging solely to the house father belongs in practice. The house father is the chief

[For information on the number of births per woman of the sample of 39 Masai women taken by Merker, see category 116, pp. 546, 548-550, 558-559, and 563-585.]

/199 cont./

853 bring back the milk secretion by a copious drinking of liquid sheep fat. Meanwhile the child is nourished with cow's milk.

757 For pains in the uterus (eñ gusset) and in the uterine ligaments (es sabôl, es sābô) the woman drinks a root decoction of ol mañgulai (Grewia villosa).

847 824 [237] To induce an abortion, the one concerned drinks a decoction of dried goat manure or a strong docoction of os segi (Cordia quarensis) or ol durgó root. During the subsequent two or three days of convalescence she takes a weak decoction of ol mokotan bark or one of the bark of ol oilale (Colubrina asiatica).

• 163 Concerning fertility, the relationship of the sexes, and child mortality I was able to discover the following. The largest number of one woman's confinements that became known to me was 17. The 87 old women questioned had given birth to 548 children all together, which gives an average of 6.3 confinements for one woman. Of these, 231, therefore 42.2 per cent, were boys, 371, therefore [165] 57.8 per cent, girls. Before their circumcision 38.7 per cent of the children died, including the stillbirths.

845 842 It should also be mentioned that the realization of a twin pregnancy is regarded as having arisen through one conception.

/349 cont./

178 that are started with as a rule and which one therefore finds in all the
241 settlements. Yet despite the ease of production of the field crops,
the transition to agriculture nevertheless is taking place in a way
178 that is reducing the population in extraordinary fashion. First of all,
182 the acclimatization process slowly being accomplished demands a
164 great sacrifice of human lives. The Masai, little afflicted with
165 fever in the dry steppes, suffers with it quite seriously in the moist
regions in which mosquitoes are permanently at home. Thus on two
occasions in the same new settlement I found all the adults and many
children sick with fever. Another one had just been abandoned by
its inhabitants, leaving the sick behind. The ones left behind,
principally men and boys, were badly reduced by fever and, in
addition, suffered to a great extent from virulent leg ulcers, whose
great extent -- in many cases they covered the entire lower leg,
from knee to ankle -- probably is to be traced back to a general
weakening of the body by fever and lack of food; for such ulcers
are not common among nomadic Masai, and, where they occur,
/350/ they remain smaller and show a tendency to heal rapidly.
Other illnesses arise from the unfamiliar diet. The rapid transition
[262] from an almost pure meat diet to an almost pure vegetable diet
makes demands on the stomach and intestines that a body weakened
by fever is seldom equal to. Sickness and death from this cause
are frequent and are increased further by the consumption of bad
water. Thus, more than half the people in one settlement com-
plained of painful diarrhea and bloody stools. All these acclimati-
[842] zation illnesses seem also to manifest their effect in decreased
fertility of the women and increased child mortality. I was repeat-
[163] edly struck by the small number of sucklings (two-year suckling
period) and older children. Thus early in 1902 in Ngaruka, between
Lake Manyara and Lake Natron, among a number of about 50 women,
I found only twelve children, three of them babies. According to
the statements of the parents, very many children had died of various
ailments, especially fever, stomach and intestinal affections, several
178 also had perished in Masai attacks. For the Masai who are becoming
619 sedentary, the ones still living among the "people" as nomads are
721 a scourge that scarcely falls short of the illnesses just mentioned in

1: Hollis G-5 (ca. 1894-1904) 1905
FL12 Masai FL12

174 A tribe coming from the north like the Masai, and possibly at one time in touch with races influenced by ancient Egypt, may conceivably represent not an improvement of the primaeval African stock but a degeneration of some other race. Still, the accounts which we have of the Bari and Dinka ascribe to them the same vague belief in a supernatural power, which most inquirers have reported as existing among the Masai, and an absence of traditions respecting the origin of the human race[1].

175 648 The history of the Masai, as far as we know it for the last hundred years, presents as its most important feature a conflict between the pastoral and agricultural sections, ending in the victory of the former and the annihilation of large settlements of the latter. The conflict was disastrous for the race, for the portion which survived depended entirely on cattle and raiding for subsistence. The herds suffered severely from plague in the eighties, and the advent of Europeans and the gradual introduction of the Pax Britannica could not be otherwise than unfavourable to the pre-eminence of a tribe whose prosperity depended so largely on continually plundering their neighbours. Nevertheless from at least 1850 to the early eighties the pastoral Masai were a formidable power in East Africa. They successfully asserted themselves against the Arab slave-traders, took tribute from all who passed through their country, and treated other races, whether African or not, with the greatest arrogance. About 1859 they raided Vanga, on the coast near the present German frontier. Thomson (*Through Masai Land*, 1885) describes how, in 1883, they entered his camp and ordered about the whole caravan, including himself, as if they had been masters and the travellers slaves. This period of triumph was succeeded by one of disaster. Rinderpest attacked the cattle and small-pox [131] [164] human beings. The surrounding tribes who had suffered from their raids were not slow to revenge themselves for the oppression and plunder of the past, and a severe famine completed the catalogue of misfortunes. The numbers of the 161 Masai were undoubtedly greatly reduced, and at present those 175 found in British East Africa only amount to a very modest figure, variously estimated at from 25,000 to 12,500. The latter estimate, which is the latest and perhaps the most correct, is based on the assumption that there are 7,500 in the

[1] See Mitterrutzner, *Die Dinka Sprache*, 1866, p. 56, &c. It is true that some expressions ascribed to the Dinka, such as 'We do not know—the wise men know,' might be interpreted as a consciousness of the loss of traditions.

1: Hollis G-5 (ca. 1894-1904) 1905
FL12 Masai FL12

101 634 claim to belong to them live elsewhere. Merker gives as the principal divisions three provinces, Kisongo, Loita, and 101 634 635 Olbruggo. This is perhaps not according to Masai traditions, but is not incorrect as a practical description of the present distribution of the tribe. The Loita and Olbruggo, also known as Elburgon and Purko, are both subdivisions of the Naivasha district, of whom the former acquired importance by refusing to accept the present Laibon, Lenana, and following instead his brother Sendeyo. Besides these districts, there 614 are four clans representing genealogical not territorial divisions: Aiser, Meñgana, Mokesen, and Molelyan. The Aiser seem to enjoy a certain primacy. The medicine men all belong to this clan, which is specially connected with Mount Ngong (to the south of Kikuyu), also called Ol-doinyo loo-'l-Aiser, the mountain of the Aiser.

561 According to the social system of the pastoral Masai the male sex is divided into boys, warriors, and elders. The first [304] stage continues until circumcision, which may be performed any time between thirteen and seventeen, or sometimes in the case of poor people not till twenty. Those who are circum- 561 884 cised about the same time (see p. 261 for details) are said to belong to the same age, and are known collectively by a distinctive name, such as 'the White Swords' or 'the [302] Invincibles.' After circumcision the warriors plait their [291] hair, but, except for a small skin hanging over the shoulders, and their arms and ornaments (which are described by Mr. Hollis), [262] go absolutely naked. They subsist entirely on meat, milk, [276] and blood, and in particular may not smoke or touch intoxicants. They do not live with the married people, but in 342 836 separate kraals with the immature unmarried girls, with whom they are allowed to cohabit freely. Tradition[1] (see 561 p. 117) ascribes this practice to the fear that if girls were kept away from the society of their own warriors, they would let themselves be seduced by the enemy; but the remedy has been worse than the danger it was to avert. The direct physical evil is considerable, and is partly responsible for the diminishing numbers of the race. Besides this, female morality after such a girlhood was naturally low, even when [177] the Masai kept to themselves. Now that they have come 764 into contact with civilization, prostitution and venereal disease [548] have become deplorably frequent. About the age of twenty- 561 885 seven or thirty, or nowadays when raiding is forbidden somewhat earlier, a warrior marries and settles down. If he

[1] It is said that among the Dinka, Bari, and Shilluk there are similar [171] customs of free love.

7: Hailey G-4 (No date) 1950 FL12 Masai FL12

divided into two sections, the agricultural ('l-oikop) and the pastoral Masai, there now remains in Tanganyika little vestige of the former.[1] A few scattered plots are cultivated by Masai, but it is with the help of alien labour. For the rest, there a little cultivation by the small Sonjo Tribe (3,521 in the 1948 Census), a people living below the Rift Wall who have not been assimilated by the Masai. The only other tribe in the District, the Dorobo (believed to number about 1,500), who are known traditionally as the "hunting people," are possibly a survival of the original inhabitants, and have become practically a servile class to the Masai.

As a pastoral people the Masai are semi-nomadic in the sense that they move with their herds in order to avail themselves of the seasonal variations in water supplies, so that they in effect practise a system of rotational grazing. They are credited with the possession of three-quarters of a million cattle and large herds of sheep and goats, but the number of their stock is subject to large and rapid variation in times of drought, and moreover East Coast fever, rinderpest and other diseases take a heavy toll of them. In the late 'eighties a combination of drought and disease almost wiped out their cattle and greatly reduced the numbers of the people themselves. Though like many other African pastoral tribes they make a cult of their cattle, they show little interest in improving their quality, and in the past have been prepared to dispose of them only in so far as they might need cash for their Poll Tax or for the few articles of food required to satisfy a people whose ordinary diet is limited to milk, meat and blood. To some extent, this position was improved during the recent War, which provided a stimulus to production of beasts for sale.

From an economic point of view therefore the Masai present a difficult problem, since the contribution they make to the economy of the Territory does little to justify their occupation of so extensive an area as twelve million acres. From a social point of view they are also a problem, owing to their reluctance to avail themselves of facilities for education. And as will be further explained in the following pages, they present an equally difficult problem of native administration, for their social system is still reminiscent of a period when their chief concern was in fighting or raiding at the expense of their neighbours.

THE FORMATION OF THE SYSTEM OF NATIVE AUTHORITIES

As already indicated, the diverse social and economic conditions prevailing in different parts of the Province have been reflected in the variety of forms taken by the Native Authorities as now constituted. Before, however, proceeding to describe these in detail, it will be convenient to give here a statement which summarizes their chief features. See page 284.

THE MOSHI NATIVE AUTHORITIES

In the Moshi District the present formation of the Chagga Native Authorities is the result of a somewhat radical reorganization carried out in 1946. Up to that time the Chagga had been split up over nineteen chiefdoms, divided from each other not only physically by the deep ravines of the mountain side, but also politically by the obstinate clan feuds and jealousies of past days. These chiefdoms were all treated as of equal standing, though their jurisdiction varied from 11,500 taxpayers in the Machame chiefdom to 400 in the Mrao. They were united in a Council of Chagga Chiefs, which was conspicuous mainly

Agricultural Masai

In 1932 the Il-Tiamus numbered about 2,250 (3,423 according to the 1948 Census), and though they are of Masai stock, being descended from a Sambur section called Il-Doigio, they have admitted a variety of refugees including Kamasya, and become rather mixed. According to von Höhnel they had originally four villages at the south end of Lake Baringo, but two were deserted on account of Masai and Suk raids, and some of the inhabitants, having lost all their cattle, took refuge on Kokua Island in Lake Baringo. They are expert swimmers and possess canoes, though von Höhnel saw none in 1887. Their dwellings are round huts with rather high-pitched and somewhat convex thatched roofs, and walls of posts and sticks. These are crowded into two permanent villages known as "Njemps Kubwa" and "Njemps Ndogo" in the Tigrish valley a few miles south of Lake Baringo; the closely packed huts almost touch each other, and the mud-walled granaries are surrounded by strong palisades.

In general the Il-Tiamus keep as close as they can to the dress and customs of the pastoral Masai; they have circumcision and *eunoto* and other ceremonies, and practise the "free-love" system of the pastoralists, though without the *manyatas*. Today they have some 180,000 acres of poor land, most of it unfit for cultivation; but they have acquired, since the establishment of British rule, some 12,000 or more head of cattle, and 30,000 goats and sheep, thus achieving in part the ambition of all Il-Oikop to become cattle people again. In the time of Thomson and Teleki, however, Njemps was an important station on the caravan route, and von Höhnel noted that they had a large extent of cultivated land. This was divided into blocks (he says of three to four miles square) which were intersected by irrigation channels bringing water from dams across the river Tigrish. This system was still working in Dundas's time, who says that the opening of the main ditch was performed with the sacrifice of a sheep at the mouth of the ditch.[12] Besides agriculture, the Il-Tiamus fished and hunted, using the bow, and spears of Suk and Turkana types.

It is possible that the fishing group called Il-Molo who live on the east shore of Lake Rudolf is to be classed as Il-Oikop.[13] They subsist on a diet of fish alone which, when Teleki and von Höhnel saw them in 1888, had produced no ill-effects; but it seems now to have resulted in considerable physical degeneration, and in the appearance of rickets in all members of the group. There seems to be a good deal of Gelaba blood in them.

The Il-Arusa round Mount Meru are a large tribe of agricultural Masai, originally of Bantu stock, but now accepted by the pastoral Masai as worthy of recognition as a group which can pay and receive cattle for compensation in cases of homicide. The Baraguyu in Southern Masailand are also to be classed as agricultural Masai.[14]

SOCIAL ORGANIZATION AND POLITICAL STRUCTURE

Social Organization

Life Cycle

From birth to circumcision a male is a boy, *ol-ayioni*. At circumcision[15] he enters an age-set and becomes a warrior, *ol-murrani*, "one who is circumcised," and may associate with unmarried girls. At the *ol-gesher* ceremony he becomes an elder, *ol-moruo*. Warriors may marry when they become senior warriors. After the *ol-gesher* the newly made elders attend to their family concerns, and get wives

Kikuyu FL10

K 164

child population since those with active yaws are discouraged from attending school. It is known, however, that bone deformities are produced only in the tertiary stage of the disease. Callanan (1926) noted in about 2,000 cases of yaws in children that 32·1 per cent. of male children and 21·6 per cent. of female children had the disease in the tertiary stage. Hence, even assuming that all children have yaws, and that every case of tertiary yaws involves bony deformity, it is obvious that in at least half of the 62·6 per cent. of male children, and 43·7 per cent. of female children with bone deformities, the occurrence of these deformities cannot be explained as due to yaws.

In addition to bone deformities, 40 per cent. of the boys had some obvious dental defect, 48 per cent. were clinically anæmic, and 62 per cent. suffered from spongy gums. There was also a high incidence of enlarged tonsils and cervical adenitis. The general condition was poor.

Kikuyu girls showed a lower incidence of all defects than the boys and were much superior in general condition.

M 164

The Masai village children present a very different picture, bone and dental defects and anæmia being relatively uncommon.

M [146]

The results of the physical examinations are presented graphically in Graphs 7 to 10. It should be noted that, while there appears to be a correlation between diet and the incidence of bone and dental defects and anæmia, there is none between diet and the incidence of enlarged tonsils and cervical adenitis.

K M 164

Table showing percentage Incidence of different Defects in Kikuyu and Masai Children.

	Kikuyu.		Masai.	
	Boys.	Girls.	Boys.	Girls.

All dental defects	40·0	28·8	8·3	7·3
Anæmia	47·8	38·9	11·7	8·5
Enlarged tonsils	56·0	53·3	35·0	52·4
Cervical adenitis	52·0	47·6	40·0	59·8

K M [143]

In the course of the investigation, records of cases attending native hospitals in the Kikuyu and Masai reserves were examined as to the incidence of various conditions. The data for the Kikuyu include figures from the hospitals at Keruguya, Fort Hall, Nyeri and Githumu. Unfortunately, there is only one hospital in the Masai reserve, that at Narok, the seat of the district commissioner and a trading centre. The patients are therefore not all Masai, about 20 per cent. being Indians or natives of other tribes. We have no information as to the distribution of cases between these and Masai. The following table shows the results expressed as percentages of the number of cases analysed :—

Kikuyu FL10

K M 164

It appears at once that the incidence of yaws, malaria, helminthiasis and ulcers is higher amongst the Kikuyu, while, on the other hand, the occurrence of chronic constipation and arthritis is more frequent amongst the Masai. Pulmonary disease appears to be somewhat more frequent amongst the Kikuyu, especially in the in-patients.

It is obvious, however, that hospital statistics cannot truly represent the general incidence of disease in a native tribe. For this reason an attempt was made by the field worker to estimate the proportions of the diseases encountered most frequently in the course of his survey. Altogether, about 12,000 natives of both tribes were seen. Of those who attended for medical treatment, a large number in both tribes required dental extractions, and many were cases of local injury and conjunctivitis. Conjunctivitis is very common amongst the Kikuyu, especially the women, and less common amongst the Masai. The following table indicates approximately the incidence of the most common diseases in the two tribes (as percentages of the total number of cases of these diseases encountered in each tribe) :—

	Kikuyu.	Masai.
Bronchitis	28	4
Pneumonia..	3	—
Tuberculosis	6	1
Ulcers	33	3
Malaria	18	2
Gonorrhœa..	1	8
Intestinal stasis	4	45
Arthritis	2	35
Helminthiasis	5	2

With the exception of pulmonary conditions, this estimate is in good agreement with the hospital data. As regards pulmonary disease, the field worker's estimate is 37 per cent. for the Kikuyu and 5 per cent. for the Masai, while the hospital statistics (calculated on the same basis) show 34 per cent. in Kikuyu and 27 per cent. in Masai. Different possible explanations might be offered for the high figure from the Masai hospital. We have already noted that 20 per cent. of the patients at this hospital are not Masai. The figure for pulmonary disease might possibly be altered to some extent by exclusion of natives other than Masai. Again, we have no information as to possible dietary and environmental differences between Masai living in the neighbourhood of Narok as compared with the more remote parts of the Reserve. In this connection it is of interest to note that Masai prisoners in Nairobi Gaol appear to be particularly susceptible to pulmonary infections (Ann. Med. Rep. Kenya, 1923). It might be thought that their susceptibility is increased by the drastic change in diet and environment to which they are subjected in gaol. It is obvious, in any case, from this observation, that the Masai have

M [184] [697]

14:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Kikuyu FL10

no marked tribal immunity to pulmonary conditions, and that any superior resistance they may show under natural conditions is probably correlated with either superior diet or environment. KM 164

It was the general impression of the field worker that disease was less common amongst the women in the Kikuyu reserve than amongst the men. This impression is supported, as far as helminthic infection is concerned, by observations by Vint (1929). In a series of post mortem examinations of 104 cases of men and women, only 19, or 18 per cent., were found free from helminthic infection. Of the 104 cases, 11 were women and 4 of them, or 36 per cent., were free from helminths. Similar evidence is found in clinical records of examinations of fæces at Nairobi Medical Laboratory in which 74 per cent. of men were found to be infected and only 49 per cent. of the women.

Tuberculosis also, as judged by hospital statistics, appears to be less common in women than in men. Wilson (1928) says " There is one noteworthy feature of all our tuberculosis statistics, and that is the overwhelming proportion of male patients," and he also states that pulmonary tuberculosis is rare in native children.

There is, of course, always the difficulty about hospital data that it may be argued that women do not go to hospital as much as the men, but even if this is true, since pulmonary conditions constitute a large proportion of all hospital cases, it seems unlikely that the proportion of women with tuberculosis going to hospital would be lower than that of men.

These indications, taken along with the marked superiority of girls over boys as described from the clinical examination of children, and the admittedly superior general condition of women as compared with men, point to an effect on general condition and health of the difference in diet of the sexes. There can be little doubt that the dietary of the young children, the girls and the women, is better balanced than that of the older boys and men, and this appears to be clearly reflected in differences in physique and health. KM 146

III.—LABORATORY AND HOSPITAL WORK.

The laboratory work was carried out by the late Dr. J. M. Henderson in conjunction with Dr. Kelly, Dr. Harvey and other members of the staff of the Medical Research Laboratory in Nairobi, which is under the direction of Dr. W. H. Kauntze. It included analyses of hospital and prison diets and metabolism experiments on native prisoners to determine the effect on weight, composition of the blood, and retention of calcium and phosphorus, of certain additions to these diets. KM 125

14:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Kikuyu FL10
Kenya FL1

Ka 146 125

calcium deficient diet, the first effects of increasing the intake of calcium would be in the consolidation of the existing bone rather than in increased rate of growth in length. The suggestion of a favourable effect on the younger boys, however, points to the desirability of further tests. It would also be of interest to determine in tests carried over much longer periods whether increases such as those procured in this experiment represent merely temporary stimulation of growth, or whether they would be maintained and represent true increases in height.

After supplement feeding was stopped, the measurements of height and weight were continued from March to September. The results are tabulated below.

Diet.	Average heights—inches.			Average weights—lb.		
	March.	September.	Increase.	March.	September.	Increase.
Basal	62·533	63·192	0·659	107·067	108·442	1·375
Maize	62·955	63·741	0·786	107·366	108·071	0·705
Maize and bone flour ..	62·863	63·540	0·677	107·669	109·065	1·396
Milk	62·986	63·743	0·757	112·871	111·643	−1·228

It will be seen that the rates of increase in both height and weight are less in all groups than in the period August to March. As regards height, the beneficial effects of the supplements appear to be carried over into the post period, but only the maize and bone flour group continued to put on weight at a greater rate than the controls.

The superiority of the results with milk during the feeding tests is in agreement with the results of milk feeding experiments on school children in Scotland (Orr, 1928, Leighton and Clark, 1929). In these tests, made on 1,157 children, quantities of milk varying from ¾ of a pint to 1 pint of milk, according to age, were fed from November, 1927, to June, 1928. Half of the children received milk and the other half a supplement of biscuits equal in caloric value to the milk. The average increases in height in the milk group were 23·5 per cent. greater than in the controls, and the average increases in weight 45·37 per cent. greater.

MK 164 125

(c) The Etiology of the Tropical Ulcer.

Since tropical ulcer is so common amongst the Kikuyu and comparatively rare amongst the Masai, and since the dietary habits of these two tribes are very different, it was thought that some deficiency in the diet might be a predisposing cause. A study of the etiology, with special reference to the nutritional state of the patients, was therefore made. Clinical data, with notes on the effect of different forms of dietary treatment, were collected in 140 cases, and blood

14:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Kikuyu FL10

MK 164 125

examinations were made to ascertain whether any differences could be detected between ulcer and non-ulcer cases.

(i) *Description of Ulcers.*

The ulcers occur chiefly on the lower outer part of the legs, most commonly of all on the lower outer aspect of the left leg. On admission to hospital they vary in diameter from about 1 to 6 ins., the edges being raised and of low vitality, and the floor covered with blood-stained exudate and foul-smelling debris. In many cases tendons protrude and are necrosed, and in some the bone is exposed and possibly dead or dying. Bacteriological examination showed a characteristic combination of Vincent's fusiform bacillus and a spirochæte. It should, however, be noted that each of these organisms has been regarded as accidental contamination, *e.g.*, by Mendelson (1918) in the case of the spirochætal infection, and Mei (1920) in the case of Vincent's bacillus.

(ii) *Associated Conditions.*

(*a*) *Trauma.*—In 125 cases, for which histories were obtained, trauma was said to have occurred in 92. Among farm labourers a prick by hard sisal leaves was the commonest injury. Such slight injuries must, however, be of almost daily occurrence in natives with bare feet and legs, either in the bush in the case of those in the reserves or in labour gangs, more especially on sisal plantations. There appears from the replies to the questionnaire on this subject to be a concensus of opinion amongst medical officers that immediate treatment of injuries, however slight, leads to a decrease in the occurrence of ulcers, and protection of the feet and legs greatly reduces the number of cases. While, therefore, it must be admitted that slight injuries do doubtless precipitate the development of ulcers and determine their location, it is difficult to believe that they are the sole cause. Indeed, there appears to be a general impression that, although trauma may be the immediate exciting cause, there is an underlying condition which predisposes to the development of ulcer, and retards its healing. Malaria, syphilis and intestinal parasites have been suggested as predisposing causes.

(*b*) *Malaria.*—It has frequently been stated that the incidence of tropical ulcer shows a close parallelism with that of malaria. In the present investigation, 123 ulcer cases were examined for malaria, and 28, i.e., 22·8 per cent., were positive. According to observations by Colonel James (1929), the proportion of native children whose blood contains malaria parasites may vary from 33 to 80 per cent., and Brennan (1926) found in Kisumu that of 1,000 slides examined for malaria parasites, 507 were positive. Anderson, T. F. (1929) in Teita found the incidence of malaria in adults to be 30 per cent., and Ross (1929) in the Kavirondo Reserve, found an incidence of 35 to 50 per cent. in the general population. It is obvious that, in the cases studied, the incidence of malaria was not higher than that in the general population.

14:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Kikuyu FL10

M
K
164
125

From the replies to the questionnaire issued by the Medical Department, it is difficult to establish any correlation between malaria and ulcers, the incidence of malaria in ulcer cases, as stated by different correspondents, varying from 0 to 100 per cent. As far as this brief study goes, there is, therefore, no evidence that malaria is an important predisposing cause of ulcer.

(*c*) *Syphilis.*—It has been suggested by some writers, *e.g.*, Stitt, that most cases of tropical ulcer are syphilitic in origin. In the present study of 123 cases, 15 per cent. showed a positive Wassermann. The following table shows how this compares with the percentage of positive reactions in sections of the general native community examined :—

Subjects.	*No. examined.*	*Percentage with definitely positive Wassermann.*
Kenya police	55 ..	29
Prisoners in Nairobi Gaol ..	100 ..	43
Ulcer cases from Kisumu ..	165 ..	55
Ulcer cases at native hospital ..	123 ..	15·4

It has to be remembered that a positive Wassermann is found in cases of active yaws. As far as these figures go, therefore, there does not appear to be any correlation between incidence of syphilis and that of ulcers. This is in accordance with results obtained by Halpin (1918), who found only one positive Wassermann in a total of 35 cases examined, and with the observations in Cocos and Perim of Edge (1921), who found no correlation between syphilis and ulcers.

(*d*) *Intestinal parasites.*—In 122 cases examined, 78·7 per cent. were found to be infected with intestinal parasites. Helminthic infection was found in 73·8 per cent. of the cases. These figures are compared in the following table with the incidence as determined by Callanan (1927) in 1,000 cases in the native hospital, including ulcer cases :—

	General hospital cases (including ulcers).	*Ulcer cases.*
Intestinal parasites ..	75 per cent.	78·7 per cent.
Helminths	65·8 ,,	73·8 ,,

There is a higher incidence of intestinal parasites, especially helminths, in ulcer cases, but it is doubtful whether the difference is significant. The incidence of intestinal parasites in the general native population varies rather widely. Ross (1929) in the Kavirondo Reserve found the incidence varying from 27·5 to 70·6 per cent. Philip (1927, 1, 2) in the Wateita found an incidence of 61 per cent. in the general population and 97 per cent. in 34 coast prisoners. Briscoe (1929) found 57 to 82 per cent. infected amongst the Wakamba.

14:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Kikuyu FL10

M
K
164
175

Hence the incidence of parasites in ulcer cases is not conspicuously higher than in the general population, and since in 22 per cent. of the ulcer cases the presence of intestinal parasites could not be demonstrated they cannot be regarded as an important etiological factor.

(*e*) *Tribal, sex, and seasonal incidence.*—The most outstanding feature with regard to the tribal incidence of ulcer is that brought out by the survey (p. 34), namely, the high incidence amongst the Kikuyu, and the relatively low incidence amongst the Masai. This is confirmed by the replies to the questionnaire which state that true indolent ulcer is rare amongst the Masai but common amongst the Wakamba, Kavirondo, Kikuyu, Luo and Lumbwa tribes. Ulcer is relatively uncommon also in the Swahilis. We have not sufficient evidence to enable us to say whether racial differences can be correlated with ulcer, but the prevalence of the condition throughout the tropics makes this appear unlikely. With regard to diet, the difference between the Masai and Akikuyu has already been discussed in the first section of this report, and it is known that the Swahili have a mixed dietary. The diets of the other tribes mentioned above, in which ulcer is common, are somewhat similar to that of the Akikuyu.

As regards sex incidence, of the 140 cases studied in this investigation only 3 were women. This however cannot be taken as any indication of the relative incidence in the two sexes, since a high proportion of the cases in Nairobi Hospital are derived from labour gangs. Of the replies to the questionnaire which dealt with the question of sex incidence, 5 stated that ulcer is more common among men, 2 among women, and 4 that there is no sex difference. Among the subjects weighed and measured by the field worker, there were more ulcers in adult females than in adult males, but among the children examined, ulcers were more common in the boys. In the Kikuyu Reserve at least, the women do most of the hard work and are consequently likely to be more exposed to injury than the men. On the whole, the balance of evidence seems to point to a somewhat higher incidence amongst men than amongst women.

M
K
164
196

It is interesting to note that the admissions of ulcer cases to hospital commonly increase just as the long rains break. This is a season when disease amongst cattle is said to be more frequent. Since the growth of vegetation, and consequently the diet of both cattle and natives is affected by the rainfall, the high incidence of ulcer at the end of the dry season suggests the implication of a dietary factor.

Indirect evidence in the same direction is afforded by Breinl's (1915) survey of disease in British New Guinea. He found that there was a marked regional difference in the incidence of ulcer depending on the use of sago as the staple article of diet, and the consequent frequent slight injuries from the spines on the leaves and

000 trunk of the sago palm. Although Breinl gives no details regarding the dietary, we know from the work of Cilento (1926) and Strong (1927) that the food of the natives of New Guinea is chiefly carbohydrate, and that the general condition and health is poor. Edge also considers that dietary deficiencies play an important part in the etiology of ulcer.

M
K
164
146

Such information as could be collected in the present study of the etiology of ulcer seems to warrant the tentative conclusion that neither malaria nor syphilis can be regarded as causative agents. The influence of intestinal parasitic infestation, if any, is not prominent. Trauma is probably an important exciting cause, superimposed upon a condition of low resistance, which is probably the most important factor, in as far as it decreases the natural healing powers and increases susceptibility to invasion by the characteristic micro-organisms. This condition of low resistance may possibly be correlated with dietary deficiencies.

M
K
141
125
164

(iii) *Effect of Dietary Treatment on Rate of Healing.*

The effect of various additions to the diet on the rate of healing was studied in 140 cases. These were divided between two wards to facilitate the treatment. The ordinary hospital diet (p. 20) was used as the basal diet. The additions consisted of tomatoes, lemons, cod liver oil, a mineral mixture similar to that used in the prison metabolism experiments, and milk. These additions were, at one time, given all together, later the tomatoes, lemons, cod liver oil and mineral mixture were given in one ward, and milk in the other.

In addition to the dietetic treatment, the routine hospital treatment, consisting of saline baths, eusol dressings and fomentations, and, where indicated, scrapings, was continued.

The patients were weighed regularly, and daily clinical notes were taken of the general condition of the patients and the rate of healing of the ulcers. This material does not lend itself to statistical treatment. All that can be given is a descriptive account, with the conclusions reached by the observer from the mass of detailed data recorded in the course of the investigation.

In the first period, all the supplements referred to above were added to the hospital diet for one ward. This was followed by an improvement in general condition of the patients, increase in weight, and " according to the general impression " of the observer, more rapid healing of the ulcers. Later, the milk ration was withdrawn from this ward and given to the control ward, after which no detectable difference was noted in the rates of healing in the two wards. The milk appears, therefore, to have been of as much value as all the other supplements together.

The observer emphasises the fact that in no case, either with the supplements all together, or separately, was there any dramatic improvement in the rate of healing. The only conclusion possible

14:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Kikuyu FL10
Kenya FL1

M
K
146
164
125

was that the supplements improved the condition of the patients, and pari passu with this improvement there appeared to be a more rapid healing of the ulcers.

This conclusion is supported by a consideration of the gains in weight of the patients and the number of weeks required for recovery, a comparison of which affords the only quantitative measure of the effect of supplement feeding. The data are shown in the following table :—

Age.	20–22.	Over 25.	Under 16.	23–25.	17–19.
Number in group	6	23	32	11	19
Gain per man per week in oz.	13·3	12·8	10·6	8·8	8·4
Weeks to recover	8·3	10·2	10·5	11·7	12·9

It will be seen that the rate of increase in weight is not correlated with the age of the subjects.

The conclusion cannot, however, be taken as more than an indication, since it cannot be assumed that all cases were at the same stage and of the same degree of severity, and since some were discharged before healing was complete.

The dietary tests, therefore, showed that none of the substances tried had any marked effect on the rate of healing, but that the rate of healing appeared to be correlated with the general condition of the patients.

(iv) *Blood Examinations in Ulcer and Non-ulcer Cases.*

Ka
164
147
125

In order to ascertain whether ulcers could be associated with any constant deviation from the normal in the composition of the blood or in physiological adjustments, the calcium and inorganic phosphorus content of the blood were estimated, the sugar tolerance and blood pressure determined, and blood counts made in a number of ulcer and non-ulcer subjects.

(a) *Calcium content.*—Estimations of serum calcium were made on 90 prisoners and farm labourers not suffering from ulcers, and on 57 ulcer cases, with 13 Europeans as controls. The following figures show the ranges and averages :—

Serum Calcium—mg. per 100 c.c.

Class of case.	No.	Range.	Average.
Prisoners and farm labourers ..	90	7·3 to 11·0	9·4
Ulcer cases	57	7·0 to 11·2	9·7
Ulcer cases on admission	46	7·0 to 11·2	9·6
Ulcer cases on discharge	11	9·7 to 11·2	10·3
Europeans	13	10·7 to 12·5	11·2

14:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Kikuyu FL10
Kenya FL1

Ka
164
197
125

of blood for phosphorus determinations, 15 gm. urea being given in each case :—

Urea Concentration Tests.

Inorganic P.		Hours after administration of urea.			
		1.		2.	
Ulcer case.	Mg. per 100 c.c.	Urine vol.	Urea.	Urine vol.	Urea.
		c.c.	%	c.c.	%
1	4·17	310	0·85	130	2·54
2	4·72	200	1·16	80	3·00
3	4·08	162	1·86	72	4·00
4	5·26	115	2·00	70	4·37
5	6·02	610	0·78	80	3·90

It will be observed that the concentration of urea is within normal limits, being in all cases over 2·0 per cent. in the second hour (the accepted standard, Maclean, 1924). Hence the very high blood inorganic phosphorus in ulcer cases cannot be attributed to renal insufficiency. The general fact of an increase is, however, in agreement with what we have seen to occur with diets ill balanced in having an excess of phosphorus and deficiency of calcium.

(*c*) *Sugar tolerance.*—In 34 subjects, of whom 16 were ulcer cases, the sugar tolerance was investigated. Tests were also made on three Europeans as a control against the possible effect of climatic conditions.

The detailed results are given in Appendix 3. Graph 11 shows the nature of the results obtained. It will be seen that the Europeans conform fairly closely to the standard curve. The natives, on the other hand, show a distinct lag. This is in agreement with tests on Indians by Bhatia and Coelho (1925), who found that those accustomed to a vegetarian diet, chiefly carbohydrate, showed a lag in the rate of return to normal after ingestion of glucose. There is little difference between the curves for ulcer and non-ulcer cases.

(*d*) *Blood pH and alkali reserve.*—It was intended to investigate the pH and alkali reserve of the blood but, owing to delay in the transit of apparatus, the work had just begun when Dr. Henderson became ill. The only available data are a few preliminary observations on the pH, which showed no marked deviation from the normal.

Ka
M
K
197
125
169

(*e*) *Blood-pressure.*—Blood-pressure estimations were made on a number of Kikuyu, both on indoor and outdoor work, and on ulcer cases. With these were compared estimations on natives belonging

14:Orr & Gilks D-4 (no date) 1931 FL12 Masai FL12
Kikuyu FL10
Kenya FL1

Ka
M
K
147
125
164

to other similar tribes, on Masai and on Europeans. The following table summarises the results :—

Blood-pressure—mm.

Tribe.	Kikuyu in-doors	Kikuyu out-doors	Kikuyu all	Others in-doors	Others out-doors	Others all	Masai	Euro-peans	Ulcer cases
Number	40	14	54	31	15	46	28	16	31
Average age	29	28	28	24	32	27	28	29	19
Systolic	110	119	112	111	123	115	117	118	98
Diastolic	76	82	77	79	87	82	79	75	64
Pulse P.	34	37	35	31	36	33	38	41	35
Weight, lbs.	127	130	128	132	128	128	133	—	—

The figures for Europeans correspond fairly closely with the normal standard, with a tendency to be slightly low. This is in agreement with other observations (Breinl and Young, 1919-20: Roddis and Cooper, 1926: Fleming, 1924). The ulcer cases are definitely lower than non-ulcer, and statistical analysis showed the difference to be significant. There is, however, a difference in average age between the two classes, which may account for at least part of the difference in blood pressure. Analysis of the data shows that there is little difference between ulcer cases over 20 years of age and those under 20, the former giving an average of 99 mm. and the latter 98. It is probable, therefore, on the whole that blood pressure may tend to be low in ulcer cases. It is most likely that this depends not so much on the ulcer *per se*, as on the lowered vitality and restricted activity of the patients.

Ka
147
125

(*f*) *Blood cell counts.*—Cell counts were made on 28 ulcer cases with 21 non-ulcer cases and eight Europeans as controls. The results were as follows :—

	Europeans.	Non-ulcer natives.	Ulcer cases.
Leucocytes	10,725	9,590	11,978
Erythrocytes	5,835,000	5,590,000	5,687,000
Hæmoglobin	91·5%	86·0%	81·2%
Colour index	0·95	0·92	0·85
Polymorphs	64·5	47·0	41·0
Lymphocytes	27·5	41·0	45·0
Large mononuclears	4·2	4·2	7·1
Eosinophiles	4·0	7·1	5·1

There was a lymphocytosis in all natives, ulcer and non-ulcer cases. In ulcer cases the hæmoglobin was somewhat low, but the difference is probably not significant. A diminution in polymorphs and increase in eosinophiles has been observed by others in Europeans in the tropics (Breinl and Young, 1919-20).

(v) *Conclusions.*

In all these blood examinations, the only outstanding point of difference between ulcer and non-ulcer cases is the high inorganic phosphorus in the blood in ulcer. It is of interest to consider the calcium and inorganic phosphorus results together :—

	Serum calcium, mg. per 100 c.c.	*Inorganic phosphorus, mg. per 100 c.c.*
European standards ..	10·0 to 10·5	.. 3
Europeans in Kenya ..	11·4	.. 3·43
Non-ulcer natives ..	9·4	.. 3·68
Ulcer cases	9·7	.. 4·55

It appears very unlikely that the alteration in balance of calcium and phosphorus in the blood of the natives should be in any way due to environmental influences, since both elements are increased in approximately the same proportion in Europeans. We have already seen that a shift in the direction of high phosphorus, low calcium, occurs in experimental animals on diets containing an excess of phosphorus and deficient in calcium, and the lack of balance in the native dietary, which is closely similar to these experimental diets, would suffice to explain a high phosphorus and low calcium content in the blood. It does not, however, explain the difference between ulcer and non-ulcer cases, for the ulcer cases are so much higher in inorganic phosphate than the non-ulcer that their calcium would be expected to be significantly lower. Instead of being lower, it is at least as high.

It would be of great interest to know whether in the individual case a rise in calcium or phosphorus occurs subsequently to the development of ulcer, and also whether any change occurs in the form in which calcium is present in the blood. It has been suggested by Greenwald and Gross (1925) that part of the calcium may normally be held in solution in the blood as calcium phosphate, which would be physiologically inert. An increase in this fraction might be thought to occur. Further, Ashford and Hernandez (1926), in analyses of the blood of over 500 subjects in Porto Rico, report that blood calcium is low, relatively to accepted standards, especially in cases of " nutritional unbalance," and that the decrease is chiefly in the diffusible fraction.

Ka
164
146

It is stated that tropical ulcer cannot be produced by experimental inoculation of the characteristic organisms unless an artificial necrosis of the skin is first produced. (Blanchard, 1914 ; Breinl, 1915.) It does not occur in Europeans, according to Edge (1921), except where the diet is restricted. It would be of the greatest interest to know whether it could be experimentally produced by inoculation of the organisms into animals in which the composition of the blood had first been altered by feeding an ill-balanced, high phosphorus, low calcium diet.

Ka 164 146

In the absence of further information, it can only be said that the results of this investigation suggest that susceptibility to ulcer, which appears to be general amongst natives on ill-balanced diets of the type mentioned, is correlated with a high blood inorganic phosphate, occurring with a normal, or slightly subnormal calcium, and that the actual occurrence of ulcer is associated with an exaggeration of this abnormality.

IV.—SUMMARY OF RESULTS.

M K 146 164

Preliminary observations and a review of existing information suggested that disease is more prevalent amongst native races than is generally supposed, and indicated that the incidence of certain diseases might be correlated with diet.

A survey of two tribes, the Masai and Akikuyu, showed that the diet of the former consisted to a large extent of milk, meat and raw blood, and that of the latter mainly of cereals, roots and fruits, the bulk of the diet being cereals. The outstanding points of difference in chemical composition of the two diets were that the Masai have a relatively very high intake of protein, fat and calcium, while the Kikuyu have a high intake of carbohydrate and a low one of calcium. Differences were found in the dietary customs between men and women in both tribes, the diets of the females approaching in each case to the mean between the diets of the males.

M K [262]

M K [141]

Physical measurements showed that the full-grown Masai male is on an average, 5 inches taller and 23 lb. heavier than the full-grown male Kikuyu, and his muscular strength, as determined by the dynamometer, is 50 per cent. greater. Marked differences were found in the incidence of disease in the two tribes, bony deformities, dental caries and anæmia, pulmonary conditions and tropical ulcer being much more prevalent amongst the Akikuyu. On the other hand, intestinal stasis and rheumatoid arthritis were more common amongst the Masai.

Ka [146]

Analyses showed that routine Hospital and Prison diets are markedly deficient in calcium, the average daily intake being only about 0·3 gm. Ca, as compared with the assessed requirement of about 1 gm.

K Ka 147

Examination of the blood of Kikuyu and other natives on a similar dietary showed that the concentration of calcium was lower than the European standard, the average of 90 cases, prisoners and farm labourers (not pathological) being 9·4 mg. per 100 c.c. serum, as compared with 10·0 to 10·5 mg. in Europeans at home, and 11·4 mg. in 13 Europeans in Kenya. The range of variation in blood calcium was wide, from 7·3 mg. to 11·2 mg., the highest figure being below the mean for Europeans in Kenya.

Kikuyu FL10
Kenya FL1

MK 196 whether, if the milk had been continued, there would have been a difference in adult stature. The results of the measurements of the Kikuyu and Masai at first sight suggests the latter alternative. But, MK [199] although there has been a good deal of intermarriage between the two tribes, they were originally of different stock, and we have no information as to whether, or to what extent the differences in stature and physique may be inherited characters. It would be an interesting study to correlate diet and stature in different countries, to ascertain whether any correlation exists between the quality of the diet and mean adult stature.

MK 164 196 K [199] There are differences in the incidence of disease in the two tribes, and one of the tribes, the Akikuyu, show abnormalities in the composition of the blood. The diet of this tribe is very rich in carbohydrate, relatively rich in phosphorus, but deficient in calcium. Experimental data have been brought forward to lend support to the suggestion that deficiencies in the diet, abnormal composition of the blood and reduced susceptibility to certain diseases which have been noted in this tribe, may be correlated. The possibility that diet may influence the susceptibility to certain infectious diseases raises one of the most important problems in nutritional research.

MK 196 With regard to the bearing of the results of the investigation on conditions in Kenya, we are probably justified in concluding that the diet commonly in use amongst the Akikuyu and other tribes of similar customs is badly balanced, being too rich in carbohydrate and deficient in calcium. It is probably deficient also in other substances required as constructive material for growth, and in certain of the vitamins. On the other hand, the Masai, with a diet at the opposite extreme, possibly have too little vegetable food rich in carbohydrate and cellulose. Improvement might be brought about by increasing the use of green vegetables by both tribes, and of milk by the Akikuyu.

The problem is therefore one which concerns not only medical and public health, but also agricultural authorities. A general improvement of agriculture and animal husbandry amongst the Akikuyu will almost certainly be accompanied by an improvement in the health and working capacity of the natives themselves.

This problem is not confined to Kenya. It appears to exist in many different areas in our tropical dependencies. It may be judged from the introductory statements in the early part of this report that the loss of health and efficiency attributable to deficient diet is, therefore, of considerable economic importance.

/179 cont./

Infectious Diseases

757 For dysentery (eňg ga en gohöge os sarge) the sick one is given
• 164 much liquid sheep-fat or melted butter to drink.

Malaria (eňg odjoňgáni). At the start of the chill, the patient is given an emetic, for example, a cold, strong extract of the bark of ol mokotan (Albizzia anthelmintica). Even before the fever breaks out, a decoction of os sogonoi bark is administered, through which, in many cases, the outbreak of the fever is supposed to be prevented or alleviated.

753 It is interesting that the Masai -- so they say -- have always
825 regarded the bite of the mosquito as a prerequisite for an attack of malaria. They say that the latter, with its bite, inoculates the person with a poison that causes malaria. For this reason they never
[361] lay out their kraals in the vicinity of a swamp or other standing water, and also avoid those places in whose surroundings during the rainy season longer standing puddles form. /180/ In order to drive away the mosquitoes they burn (in the camp or in the hut) the peppermint-scented ol eňoroň (Plectranthus Merkeri, Gürke). If a kraal is badly afflicted with mosquitoes, its inhabitants leave it immediately out of fear of fever (1).

1. So they told me as early as 1895. When, at the beginning of 1896, Zendeo with a number of his people came to Moschi, I received in reply to my question as to whether they had to suffer much with fever the answer: "No, there are no mosquitoes near our kraals."

757 Other emetics are: root powder of ol aisai (Cyathula Lindowina Vlks.), which is taken stirred in water; a decoction of roots and stalks of ol gurschaschi (Barleria mucronata Lindau); a root decoction of ol moran (Solanum nigrum); the boiling down of a handful of bark or root of ol duňgui (Harrisonia abyssinica Oliv.); a cold extract of five finger-size pieces of the bark of olti (Acacia mellifera Bth.)

/180 cont./

757 and the chewing of the root of ol asajet (Withania somnifera Z.) are regarded as acting especially vigorously. Children are given an infusion of the leaves of ol magingi (Moschosma multiflora [Hoch.] Bth.), because it has a considerably milder effect.

753 757 They call another greatly feared fever ol oirobi l'en duhúr and see its original cause in the bite of a kind of tick living underground, which they designate as en duhúri jámon. The patient is given liquid sheep fat mixed with the powdered grains of ol odoa (Maesa lanceolata Forsk.). Presumably this fever is identical with relapsing fever, for [136] which Professor Robert Koch identified as the carrier of the spirilla [164] a species of tick living underground (Ornithodorus Larigni) (2).

2. During the day Ornithodorus hides in cracks of buildings or in the ground and emerges as soon as a victim approaches. Merker's conjecture could therefore correspond to the truth, and the more so since to me too the Masai designated and displayed an unquestionable Ornithodorus as the carrier of a fever. The ed. Dr. S.

757 Against chickenpox (e riri or en diabobon) no medicine is known. [164] The sick person remains in the hut, is given as a drink a little milk mixed with fresh blood and sheep-tail fat, two things that are regarded as strengthening; furthermore, as food, a piece of mutton roasted in the skin at the open fire.

For protection against smallpox (ol maschúgu or ol minjaloi) [751] healthy persons are inoculated in two incisions on the forehead with the smallpox pus en gimek) of a sick person. Smallpox patients are [164] given a decoction of the roots of en dulele (Solanum campylacanthum) mixed with cattle blood as a diaphoretic and at the same time a nourishing remedy. In order to increase the sweat secretion, the [758] patient is laid beside the hearth fire. Diet; no drink except the above-mentioned medicine; as food, the head of a sheep roasted in the skin or another piece of mutton similarly prepared.

/180 cont./

757 Elephantiasis scroti (en dorenge) is regarded as a punishment of
753 God for incest committed. A therapeutic treatment is unknown.
• [164] Other forms of elephantiasis are said not to occur among the Masai; the one mentioned seems to be infrequent to the point of having disappeared.

757 /181/ To cure the parasitic cutaneous eruption (1)

> 1. The eruption heals within three days if the affected places on the skin are well covered with a noninritating salve (for example, zinc ointment), after they have been previously cleaned with soap.

(el bebedo) called upele by the coastal people, the body is rubbed with oil obtained from the ol dimuai tree (Commiphora sp.), whereupon healing follows in two to three days -- as I was able to find out for myself a few times.

164 I have never seen among the Masai the frambesialike schiwaki sickness (2)

> 2. Schiwaki is often mistakenly taken for lues. With the administration of potassium iodide the schiwaki sores heal in the course of two to three weeks.

very common on the Kilimandscharo. To a corresponding question I always received the answer that this very infectious disease is unknown to them.

Ailments of the Respiratory Organs

757 Against head colds (ol oirobi l oñ gumeschi = cold of the
[164] nostrils) one snuffs tobacco mixed with the powdered bark of the en doroniki tree. In severe cases, as a diaphoretic, one administers the juice of the tuber of ol amboschi (Momordica cardiospermoides Kl.) or a decoction of eng aitetoijai kete (Aneilema Johnstonii K. Sch.).

/181 cont./

757
164

Bronchial catarrh (es sedja eñ geroget = cough). The patient is given a handful of the powdered bark of ol marbait (Croton spec.) stirred into fresh cattle blood, or a paste that consists of a third of a liter of liquid honey and two handfuls of the powdered bark of os sogonoi. A decoction of the bark of ol okiteni is supposed to have a loosening effect; for the same purpose one also chews the bark bast of ol debbe (Acacia Merkeri) and of ol bararuai or ol bariroi (Lonchocarpus Bussei spec.), and eats the unripe fruits of ol amriake (?). The mother gives small children the juice obtained by chewing a species of Fagara (ol oisuggi) or ekum (Spilanthus Acmella L.) or the leaves of eñ gawarna (Cluytia Kilimandscharica Engl.).

Ailments of the Digestive Organs

For nausea one drinks a decoction of the bark bast of ol bararuai (Lonchocarpus Bussei sp.) stirred with liquid sheep-fat, or one takes an emetic, such as: stronger than the ordinary doses of ol mokotan, ol odoa (Maesa lanceolata), ofti (Acacia mellifera).

Diarrhea and abdominal pain (ekwet eñ gohóge or eñ gorotik, the latter word designates the watery excrement). To check it, one drinks extracts or decoctions of the bark of ol bugoi (Terminalia Brownii Fres. var. Merkeri Engl. and Terminalia Hildebrandtii Engl.) or of ol nai (Acacia spirocarpa Hochst.). In addition, bark extracts of ol ñañboli (Ficus Sycomorus), a decoction of the bark of os sagararám (Bauhinia reticulata D. C.), of the root /182/ bark of ol amai, goat-meat broth in which a few pieces of the root of ol ama (Ximenia americana L.) have been boiled, or a root extract of ol amerori mixed with milk. The powdered bark of ol ugunonoi (Heeria pulcherrima) stirred into fresh milk is regarded as a quick and sure remedy. For abdominal pains a decoction of ol gbénia (Cassia obovata coll.) is administered, or a leaf extract of ol magutugut, also called ol magingi kete (Clerodendron discolor [Kl.] Vtke.). Because of its mild action, the extract or decoction of a Commiphora species (o'ropande) mixed with beef bouillon or an infusion of the leaves of os siteti (Grewia bicolor Juss.) is popular. Pregnant women
000 prefer this medicine to the ones previously mentioned. In order to

/182 cont./ In order to
751 avoid the onset of a case of diarrhea as a consequence of the very popular copious enjoyment of liquid fat, a root decoction of the above-mentioned ol ama tree (Ximenia americana L.) is administered.

757 Constipation (ol gǒlomi). The most popular remedies in severe
• 044 cases are a decoction or extraction of the bark of ol jani 'njugi (Embelia kilimandscharica Gilg) mixed with fat, or, in milder cases, the pepperlike grains of ol odoa (Maesa lanceolata Forsk.), which are chewed.

[827] Regarded as aiding digestion is the bark of ol mata (Thespesia Garckeana F. Hoffm. and Dombeya reticulata Mast. vel aff.), of en demǧscho, also called ol eguǧugi (Turraea Volkensii Gürke), which is drunk mixed with meat broth, and of a still unknown Acacia species (ol alili), which is why the warriors, during their meat feasts, add these powdered barks to their drinking water, as well as an extract of the pounded root of ol ebulǒt (Bridelia cathartica Bert).

"To clean out the stomach" the warriors take, once every three or four months, a medicine called en janigitti, consisting of the bark decoction of ol odoa (Maesa lanceolata), ol mokotan (Albizzia anthelmintica), ol marbait (Croton spec.), ol jani 'njugi (Embelia kilimandscharica Gilg), ol getalassua (Myrica kilimandscharica Engl.), os sugurtuti or ol dinjai (Cissus quadrangularis).

As Tonicum roborans /strengthening tonic/ and beautifying
[826] agent, pulverized bark of ol dǐmǐgǒmmi (Pappea capensis Eckl. et Zeyh.) is added to the drinking water. It is supposed to make the skin softer and more elastic, as well as to give rise to an increase in the padding of fat through which sharp contours are rounded. The remedy is especially popular among warriors.

757 For liver pains (aia e munjwa) one drinks a decoction of the
164 bark of os sodjo (Enclea fructuosa).

For spleen pains and spleen swelling (aia ol dassin), the powdered bark of the same tree, stirred to a paste with honey, is eaten or, mixed with honey beer, is drunk, as is a root decoction of os senetoi (Cassia didymobotrya Fres.), which as a rule is mixed with milk.

/183/

752 164 Liver and spleen abcesses are supposed to be cut open to drain off the pus. I saw scars in the areas in question several times, but was never able to observe the operation itself.

757 164 For so-called bilious fever (ol odoa = the gall), an emetic is taken first, either a strong dose of grains of the ol odoa (Maesa lanceolata) or a bark extract of ofti (Acacia mellifera); then one drinks a root decoction of ol deregeli (?) or of ol manuai (?).

To get rid of intestinal worms (taeniae [ol gurto, el gurt] and ascarids [ol budi, el budok]) one uses decoctions of the bark of ol mokotan (Albizzia anthelmintica), of the root of ol deregeli (?), of the fruits of ol odoa (Maesa lanceolata), or also of the powdered bark of ol jani 'njugi (Embelia kilimandscharica Gilg), the latter of which is always taken with fat since otherwise it is too acrid and easily causes violent abdominal pains with diarrhea.

To cure ancylostomiasis (eig ǵa eí gijábe) one administers a decoction of the bark bast of ol mokotan (Albizzia anthelmintica); the bark bast is cooked with meat; the patient drinks the meat broth.

Venereal Diseases

757 [164] [548] Gonorrhea and especially lues are quite rare among the Masai. This is due in part to the absence of professional prostitution, and in part to the fact that the Masai are familiar with the dangerousness of these diseases and their easy transmissibility. Those stricken with lues are segregated and may not enter any kraal until the external symptoms of the illness have disappeared; during this time they live outside the kraal in a superficially built hut surrounded by thorn branches for protection against predatory animals. Accordingly lues is called eng ea auló, formed out of eng ea = the sickness, auló = outside the kraal. Lues patients drink a great deal of liquid fat and liquid butter for a cure. One drips on the lues ulcers, as well as on [439] those of the chancres, juice of the leaves of ol aisigirai (?), sprinkles on them a powder made out of the leaves of ol agaramóni (?), or burns them with Cuprum sulfuricum, which the Masai obtain in trade with caravans.

/183 cont./

757 For gonorrhea they use a whole number of medicaments, to some of which they attribute only or chiefly a diuretic effect, to others a healing effect as well. The principal remedies are the following: decoction of the bark of ol jani 'njugi (Embelia kilimandscharica), often mixed with calf urine; furthermore of os sagararam (Bauhinia reticulata), ol debesi (Acacia cfr. verrugia Schwfth.), ol mokotan (Albizzia anthelmintica) and ol gelai (?); a root decoction of the latter is also used, as well as of ol orondo (Cissus sesquipedalis Gilg), ol assassiai (Osyris tenuifolia Engl.), ol dorotua, and, finally, dococtions of the dried root bark of o'remit (Salvadora persica) and of the wood of a Rhus species (ol mesigie kete), which is regarded especially as a diuretic.

[164] /184/ For cystic catarrh one drinks a weak decoction of the root of o'remit (Salvadora persica).

832 A bark decoction of ol dimigŏmmi (Pappea capensis) is regarded as an aphrodisiac for men, one made out of ol mokotan (Albizzia anthelmintica) for women. The bark of the trees ol giloriti (Acacia [263] abyssinica) and ol okiteni, used as seasoning for meat broth, is supposed to have the opposite effect among the warriors.

These last two remedies, however, are by no means regarded [147] as sedatives, but, on the contrary, as stimulants. The people explain the effect ascribed to them here with the words: the warrior does not like the odor of the girl, by which probably a specific foetor urinae /stink of urine/ more or less clinging to the clothing of all women is to be understood.

Nerve Ailments

757 With headache (eńg ea ol ogunja) a blister is produced on each [164] of the temples and on the nape with the fire twirler (ol biron) rubbed hot; more rarely one ties a cord rather tightly around the forehead [177] and the occiput. The latter remedy is not peculiar to the Masai, but has been adopted in places from other peoples.

[164] For earache (eńg ea ŏń gia) one pours warm butter into the ear.

/184 cont./

757 With toothache (eng ga ol alai) one bites on a very hot residuum
• [164] of fat with the aching tooth. Pieces of twigs of o'remit (Salvadora
[515] persica L.) and ol abalasas (Dodonaea viscosa L.) chewed to resemble
a brush at one end serve as toothbrushes.

[162] For rheumatic pains in the muscles one makes use of massage,
which is practiced by the women, or one makes poultices with the
pulp of the pulverized root of o'remit (Salvadora persica), which
[593] also finds use otherwise as a "mustard plaster." Married men have
[385] themselves massages by their wives to get rid of pains in the leg
muscles after long marches, whereas the warriors scorn this help as
unmanly. Furthermore one administers a root decoction, preferably
mixed with a broth from steer meat, of o'rarait (Cissus rotundifolia
[Forsk.] Vahl.) or of ol logiono (Pentas zanzibarica [Kl.] Vtke.),
or also a decoction of the wood of ol gonjel (Rhamnus prinoides
l'Herit.). For rheumatic pains in the back one drinks a root decoction,
sweetened with honey, of ol asasia l os subertai (Osyris tenuifolia
Engl.). To cure articular rheumatism a root decoction of ol ogino
(Boerhavia diffusa L.) is administered. Besides these remedies, those
that are regarded as diaphoretic, especially the above-mentioned ol
amboschi (Momordica cardiospermoides Kl.) and eng aitetoijai kete
(Aneilema Johnstonii K. Sch.), are also given.

276 Other than for curative purposes the warriors regularly, and, to
be sure, for the entire duration of their membership in the warrior
[126] standing, take various nerve /185/ stimulants. These are taken
especially on war expeditions and, even more, during the meat
feasts forming the preparation for these. One of the most popular
stimulants is the bark of the frequently mentioned ol mokotan
(Albizzia anthelmintica). One pounds a piece of bark bast the size
of two hand-palms with a club and then lets it steep for a few minutes
in still hot meat broth. The other stimulants are: ol dinjai or os
sogurtuti (Cissus quadrangularis); an arm-long piece is cut up and
boiled in water. The extract is taken mixed with goat-meat broth.
Equally strong in effect is the root of ol ongrua (?). One takes a
piece of root three centimeters thick and approximately ten centi-
meters long, chops it twice, and cooks it with beef broth. The
decoction smells disgusting.

/189 cont./

757 means rare that two or three rows are cut for one operation. Most adult Masai have such scars in greater numbers; however, one also often finds people whose entire torso is literally covered with cupping scars. It seems as though the people like to avoid being cut twice in the same spot.

Upon swellings one puts the pulp, allegedly acting as a resolvent, of the chewed plant of ol agaramóni (Crossandra nilotica Oliv.).

752 757 .164 Abcesses, when they are ripe, are punctured with a small, pointed, double-edged knife and cut open only after the draining of the pus by pressure. Then the wound is washed out with tepid water and cleaned out, using the nail of the index finger, as well as possibly also the aforementioned knife, as a sharp spoon. Finally, one sprinkles on it a caustic powder made from the root of ol gneriandus l en doje (Plumbago ceylonica). The surgeon does not apply a bandage.

Abcesses of the mammary gland are merely punctured and emptied.

With panaritium the nail is removed and the wound washed out.

Suppurating lymph glands (ol gnarnari eti ñ gimek) are treated like abcesses, but the lymph gland is cut out before the application of the caustic powder.

An ailment called ol dododoi l en daré = goat ulcers (1)

1. This is most probably a matter of anthrax carbuncle.

by the Masai manifests itself in that the person afflicted has one, less frequently two, hard lumps the size of a hazelnut under the skin, tapering into a taillike point at the bottom. I saw these ulcers (em boroi) and their scars -- somewhat larger than a mark piece -- on the temples, on the chest, on arms, legs, and on buttocks. As [753] the original cause the people cite the eating of meat of goats or sheep that died of eng ea nairogua = hot sickness (2).

2. Pulmonary anthrax.

758
757
[752] /189 cont./
The hard lumps are cut out. During the illness the patient is given a diet of meat roasted on charcoal and, as medicine, a decoction of the roots of ol demellua /190/ (Solanum setaceum) or ol oki with the addition of honey; a root decoction of eh gogi (Lycium cf. arabicum Schweinfurth) mixed with milk or meat broth or such of ol amelóki (Maerua Johannis Vika. et Gilg), which, as a rule, is mixed with a little honey or fresh livestock-blood, is also regarded as curative. The patient drinks this liquid when he is thirsty. The illness is supposed to lead to death if this diet is not adhered to and the patient takes in particular cold water or milk, as well as cooked meat. On the other hand, if the prescribed way of life is observed for two or three months, the lump, gradually pushing outwards, is said to fall off. Since, however, the continuous meat diet is too expensive and the herb medicines cannot be obtained without difficulty, the operation is preferred in by far the most cases.

752 A persistent fever connected with swelling of the three pharyngeal tonsils, accompanied by violent coughing and considerable loss of
• [164] strength, especially common in youthful age, the Masai call ert el muli = gland sickness. Very probably it is a matter of adenoidal proud flesh in the nasopharyngeal cavity. The patient turns to the surgeon to be cured. The latter, putting his hand into the patient's mouth, scrapes the pharyngeal tonsils with the nail of his index finger, or with a small knife, so strongly that they bleed profusely. A rather large number of people whom I questioned about the success of the cure asserted that they always could count on certain recovery. Two of my boys, Masai youths about 11 to 12 years old, fell ill with the above symptoms. In spite of careful symptomatic treatment, their recovery of strength was so unsatisfactory that, upon their request, I gave them permission to go to a nearby livestock-kraal in the steppe for relief. After eight to fourteen days they returned, healthy and refreshed, and told me, which corresponds to the truth, that the surgeon had treated them in the manner described.

Fresh, simple wounds (en duñoto, n dungot) are cleaned as was described above for the ulcers, but during this one tries to avoid unnecessary irritation, for fear of greater bleeding. On this account, many surgeons do not proceed with treating the wound until several

/345 cont./

182 shareholder, the rest of the shares are in the hands of his wives, who
595 acquire these shares through the birth of a son. Through this the wives, who have the duty to tend and care for the livestock, are interested in the preservation of the property in the most extensive way. This is the one factor of the polygamy of the Masai promoting prosperity with all its advantages for the political economy. The other lies in the fact that many women give birth to more sons for one man than one woman could. Here, however, male offspring are augmenters of the paternal property. The boy grows up to become a warrior and brings his family the spoils of the numerous raids, through which not only is the herd increased, but, through the supply of new blood, is also improved.

Polygamy among the Masai is therefore a natural institution. Without it large masses of women would be deprived of their natural occupation, a condition that seems impossible for a primitive people. It is, moreover, a source of prosperity, which, among a culture-poor nomadic people, can only make itself felt favorably for their preser-
[146] vation as a people. From it follows, first of all, good nutrition, which makes the body resistant to the effects of illnesses. It corre-
[165] sponds to my observations that among the Masai in general, among
[164] adults, fewer cases of death occur as a consequence of illness than is the case among the Negroes living in their vicinity. Also, serious illnesses are more infrequent among them than among the former
182 and are milder in their course. The circumstance that abortion is
847 practiced by the women in only very rare exceptional cases also undoubtedly acts to promote health. One can sufficiently observe the harm that this bad custom has often caused primitive peoples among the various neighbors of the Masai, though indeed there are also exceptions to this. Thus, I met a number of Dchagga women who went through this operation four to six times and allegedly, as well as apparently, without harm.

182 In contrast to the high fertility there is also a rather high child
165 mortality, though infanticide is entirely unknown. It is definitely
854 beneficial for the child that through work the mother is not kept
[847] outside the kraal, but can always remain in the vicinity of the child.
[853] The long nursing period of about two years is also advantageous.

/345 cont./

182 Harmful to the child's health, on the other hand, are the poor huts,
165 which are always /346/ filled with dense smoke, and furthermore
854 the lack of cleanliness and the faulty diet. The belief, widespread
[362] among all African primitive peoples, that fat gives strength and
[853] health leads to the stuffing of the baby, despite all its struggles and
146 screams, with unbelievable quantities of butter. Sour, as well as
856 stomach and intestinal affections, and ailments of the respiratory
• [164] organs are therefore also the principal illnesses that carry off the babies. If one compares the high mortality among children with the very low one in later life, and if one further considers that, in inspecting the Masai kraals, one finds almost only healthy people full of energy, one cannot resist the thought that the treatment of the children, especially the babies, unconsciously aims at culling out all the weak elements at an early age and preserving for the people only the most vigorous ones that are equal to the demands of life. Seen from this standpoint, that of natural selection, the high child mortality seems less unfortunate. Finally, the late age
182 at which the men enter their first marriage is unfavorable for popu-
582 lation increase. Until about the 28th or 30th year of life the Masai
832 belongs to the warrior standing, and he may marry only after leaving
837 it. This circumstance in turn makes free love, such as exists in the warrior kraals, an understandable social institution. One must judge this arrangement on the soil in which it grows, in order to remain objective. From the same standpoint we shall have to judge more leniently the free love existing among the married, which, despite numerous restrictions, appears to us like a continuous prostitution
[948] of the woman. One can do this all the more since through that professional prostitution is excluded here, and consequently the possibility of infection is greatly reduced; this last circumstance is undoubtedly to be regarded as people-preserving. Actually the Masai
[164] maintain that in former times (before the great livestock epidemics) venereal diseases only very rarely occurred. Immorality is rightly
182 regarded as a people-destroying factor, and history teaches us by
831 many examples how licentious and refined sensuality was one of the grounds that caused the decline of higher peoples. Here among the Masai, however, it is not a matter of this unnatural kind of

/349 cont./

178 that are started with as a rule and which one therefore finds in all the
241 settlements. Yet despite the ease of production of the field crops,
the transition to agriculture nevertheless is taking place in a way
178 that is reducing the population in extraordinary fashion. First of all,
182 the acclimatization process slowly being accomplished demands a
• 441 great sacrifice of human lives. The Masai, little afflicted with
465 fever in the dry steppes, suffers with it quite seriously in the moist
regions in which mosquitoes are permanently at home. Thus on two
occasions in the same new settlement I found all the adults and many
children sick with fever. Another one had just been abandoned by
its inhabitants, leaving the sick behind. The ones left behind,
principally men and boys, were badly reduced by fever and, in
addition, suffered to a great extent from virulent leg ulcers, whose
great extent -- in many cases they covered the entire lower leg,
from knee to ankle -- probably is to be traced back to a general
weakening of the body by fever and lack of food: for such ulcers
are not common among nomadic Masai, and, where they occur,
/350/ they remain smaller and show a tendency to heal rapidly.
Other illnesses arise from the unfamiliar diet. The rapid transition
[262] from an almost pure meat diet to an almost pure vegetable diet
makes demands on the stomach and intestines that a body weakened
by fever is seldom equal to. Sickness and death from this cause
are frequent and are increased further by the consumption of bad
water. Thus, more than half the people in one settlement com-
plained of painful diarrhea and bloody stools. All these acclimati-
[192] zation illnesses seem also to manifest their effect in decreased
[163] fertility of the women and increased child mortality. I was repeat-
edly struck by the small number of sucklings (two-year suckling
period) and older children. Thus early in 1903 in Ngaruka, between
Lake Manyara and Lake Natron, among a number of about 50 women,
I found only twelve children, three of them babies. According to
the statements of the parents, very many children had died of various
ailments, especially fever, stomach and intestinal affections, several
178 also had perished in Masai attacks. For the Masai who are becoming
619 sedentary, the ones still living among the "people" as nomads are
721 a scourge that scarcely falls short of the illnesses just mentioned in

/350 cont./

178 its effect. Hated as faithless and despised as agriculturalists, the
619 sedentary ones are constantly plagued by raids that not only cause
72 them great loss in human lives, but also take away any possibility
[829] for them to arrive at any improvement in their way of life by keeping
livestock for the attainment of the meat and milk diet so necessary
[177] for them. Moreover, the frequent intercourse with sedentary Negroes
[164] and caravan people leads to an increase in the cases of venereal
582 diseases. Premature marriages of girls, which can not happen among
178 the Masai still living as nomads, is not rare among the sedentary
184 ones and often enough leads to the death of the young woman who
165 is scarcely more than a child and whose bony structure, despite her
attained capability to conceive, is not yet developed. Finally, it
178 must still be mentioned that no doubt the longing for the formerly
182 free life in the broad steppes and the feeling of humiliation over
having become a so deeply despised cultivator of the soil oneself
are factors that have a wasting effect. The latter circumstance also
[186] brings with it a decrease of national pride. The barrier that kept
[177] Negroes out of the community of the Masai has fallen. A disadvan-
[144] tageous race mixture hurting the people is slowly taking place.
Among the Wakuafi this process was more rapid in their period. At
[648] that time no European administration prevented their raiding exped-
[721] itions in Negro regions, from which they brought home livestock
and women experienced in agriculture.

177 In frequent -- almost daily -- intercourse that soon springs up
178 and then continues to exist between the Masai who have become
sedentary and the settled Negroes, the Masai naturally also share
in the disadvantages that /351/ come to the Negroes through the
encounter of their lower culture with our higher one.

178 We have seen how many difficulties sedentation brings to the
177 Masai, and it is therefore not surprising that a part of those who
361 have already become sedentary give up their fixed residences again
after repeated failures. These then often join the Wandorobo, to
live by hunting, and call themselves this.

*136 of Lake Victoria have long been occupied by dense human populations supported by the abundant fish of the lake [164] and the well watered agricultural land nearby. Movement of these people eastward into Masailand has been restricted by tsetse flies which carried both human and animal trypanosomes, and by the Masai within the past two centuries.

The one area where in historic times there was a significant break in the barriers of Western Masailand is in the northeast corner. The races of Thomson's gazelle, wildebeest (Fig. 5), and kongoni that were found in Western Masailand, were also found in the Kedong region of the Rift near Mt. Suswa, and northwards (Roosevelt and Heller, op.cit.). Wildebeests, as an example, were found in the Rift north and west of Nairobi at least until the time of the first world war. Meinertzhagen (1957) records them as being found on the south shore of Lake Naivasha in 1902. Roosevelt and Heller (1914) showed wildebeests occupying the center and west of the Rift in the vicinity of Mt. Suswa just south of Naivasha in 1909 and 1910, and Percival (1928) noted their distribution slightly earlier as extending to the East Rift Wall (near the present Kijabe). The animals involved were definitely the western form and not the

[TEXT CONTINUED ON PAGE 35]

*133 The map (Fig. 3)! shows the numbers of rivers that rise in the hills from the Kenya border to the northern edge of the Serengeti Plain. The Bologonja and several smaller springs are perennial, but most of these watercourses flow only during wet periods, or following occasional heavy rains during the dry periods (Fig. 18). At this time the catchment areas of the scattered hills are critically important.

*13 In the hills between the boundary of the Serengeti National Park and Loliondo, cutting, overburning, and overgrazing by the Masai have seriously reduced the watershed values of the area. Runoff is torrential after rains, and virtually no dry season surface water is available through the area. There are several *[312] [232] bore holes (Fig. 19) which have the effect of concentrating livestock and causing very severe overgrazing in the vicinity.

• [164] Across the hills in the park destruction of the vegetation has been very much less, largely because it is an area infested by tsetse fly, so the Masai have not grazed it much. The vegetation provides fair watershed and even the scattered dry season storms produce some surface water.

! [See p. 19.--Analyst]

*136 and the species of fly, It can vary from a few days to several weeks. When feeding, the fly may ingest trypanosomes from the blood of the host animal. Trypanosomes complete their life cycle inside the tsetse fly and after a varying period, usually about three weeks, the fly can infect another host animal while feeding [164] upon it. One trypanosome causes sleeping sickness in man and another the nagana disease in cattle and some other ungulates.

[164] Human sleeping sickness was formerly relatively common in the area from Ikoma and Banagi westwards. It has not been much problem since the late 1930's, presumably because the human cases have received treatment so that there are few infected host humans for the flies to bite. Nagana disease is common throughout the study area wherever there are tsetse flies. The cattle in the area are generally quite susceptible to nagana, while goats and sheep are highly resistant. The susceptability of various species of wild animals varies greatly from species to species, but most of the common wild ungulates are not affected, although some may serve as reservoirs for the trypanosomes.

Tsetse flies are quite specific in their host preferences. Langridge (1960, 1961) and Lamprey, et. al.

/199 cont./

853 bring back the milk secretion by a copious drinking of liquid sheep fat. Meanwhile the child is nourished with cow's milk.

757 For pains in the uterus (eñ gusset) and in the uterine ligaments (es sabol, es sabo) the woman drinks a root decoction of ol mañgulai (Grewia villosa).

847 824 [237] To induce an abortion, the one concerned drinks a decoction of dried goat manure or a strong docoction of os segi (Cordia quarensis) or ol durgó root. During the subsequent two or three days of convalescence she takes a weak decoction of ol mokotan bark or one of the bark of ol oilale (Colubrina asiatica).

163 Concerning fertility, the relationship of the sexes, and child mortality I was able to discover the following. The largest number of one woman's confinements that became known to me was 17. The 87 old women questioned had given birth to 548 children all together, which gives an average of 6.3 confinements for one woman. Of these, 231, therefore 42.2 per cent, were boys, 371, therefore [165] 57.8 per cent, girls. Before their circumcision 38.7 per cent of the children died, including the stillbirths.

845 842 It should also be mentioned that the realization of a twin pregnancy is regarded as having arisen through one conception.

/345 cont./

182 595 shareholder, the rest of the shares are in the hands of his wives, who acquire these shares through the birth of a son. Through this the wives, who have the duty to tend and care for the livestock, are interested in the preservation of the property in the most extensive way. This is the one factor of the polygamy of the Masai promoting prosperity with all its advantages for the political economy. The other lies in the fact that many women give birth to more sons for one man than one woman could. Here, however, male offspring are augmenters of the paternal property. The boy grows up to become a warrior and brings his family the spoils of the numerous raids, through which not only is the herd increased, but, through the supply of new blood, is also improved.

Polygamy among the Masai is therefore a natural institution. Without it large masses of women would be deprived of their natural occupation, a condition that seems impossible for a primitive people. It is, moreover, a source of prosperity, which, among a culture-poor nomadic people, can only make itself felt favorably for their preservation as a people. From it follows, first of all, good nutrition, [146] which makes the body resistant to the effects of illnesses. It corre- [165] sponds to my observations that among the Masai in general, among [164] adults, fewer cases of death occur as a consequence of illness than is the case among the Negroes living in their vicinity. Also, serious illnesses are more infrequent among them than among the former 182 847 and are milder in their course. The circumstance that abortion is practiced by the women in only very rare exceptional cases also undoubtedly acts to promote health. One can sufficiently observe the harm that this bad custom has often caused primitive peoples among the various neighbors of the Masai, though indeed there are also exceptions to this. Thus, I met a number of Dschagga women who went through this operation four to six times and allegedly, as well as apparently, without harm.

182 165 854 In contrast to the high fertility there is also a rather high child mortality, though infanticide is entirely unknown. It is definitely beneficial for the child that through work the mother is not kept [847] outside the kraal, but can always remain in the vicinity of the child. [853] The long nursing period of about two years is also advantageous.

/345 cont./

182 Harmful to the child's health, on the other hand, are the poor huts,
• 165 which are always /346/ filled with dense smoke, and furthermore
854 the lack of cleanliness and the faulty diet. The belief, widespread
[362] among all African primitive peoples, that fat gives strength and
[863] health leads to the stuffing of the baby, despite all its struggles and
[146] screams, with unbelievable quantities of butter. Soor, as well as
[856] stomach and intestinal affections, and ailments of the respiratory
[164] organs are therefore also the principal illnesses that carry off the babies. If one compares the high mortality among children with the very low one in later life, and if one further considers that, in inspecting the Masai kraals, one finds almost only healthy people full of energy, one cannot resist the thought that the treatment of the children, especially the babies, unconsciously aims at culling out all the weak elements at an early age and preserving for the people only the most vigorous ones that are equal to the demands of life. Seen from this standpoint, that of natural selection, the high child mortality seems less unfortunate. Finally, the late age
182 at which the men enter their first marriage is unfavorable for popu-
582 lation increase. Until about the 28th or 30th year of life the Masai
836 belongs to the warrior standing, and he may marry only after leaving
837 it. This circumstance in turn makes free love, such as exists in the warrior kraals, an understandable social institution. One must judge this arrangement on the soil in which it grows, in order to remain objective. From the same standpoint we shall have to judge more leniently the free love existing among the married, which, despite numerous restrictions, appears to us like a continuous prostitution
[548] of the woman. One can do this all the more since through that professional prostitution is excluded here, and consequently the possibility of infection is greatly reduced; this last circumstance is undoubtedly to be regarded as people-preserving. Actually the Masai
[164] maintain that in former times (before the great livestock epidemics) venereal diseases only very rarely occurred. Immorality is rightly
182 regarded as a people-destroying factor, and history teaches us by
831 many examples how licentious and refined sensuality was one of the grounds that caused the decline of higher peoples. Here among the Masai, however, it is not a matter of this unnatural kind of

The villages, *eng ang*, pl. *ing angite*, is the minimal territorial unit. Villages are distributed within the minor sections. JOHNSTON,[15] had already noted that "they generally range within certain districts". A village is the residence of one or more elders with his or their wives and cattle. A man after his marriage does not live in the same village as his father, unless the latter has become senile and unable to cater for himself. 621 [591] [888]

The internal structure of the village is based on the gatesystem. This consists in a proper arrangement of the house on the sides of the village's gates. The village consists of a large yard enclosed by a thorny fence with gates opening at opposite sides. The house are built on the right and left sides of each gate, every gate with its houses belonging to a single elder. The usual arrangement is as follows: the first house on the gate's right is the dwelling of the owner's first wife; the first house on the left side is that of his second wife; the second house on the right side is that of his third wife; and the same alternating order is followed if marries more wives. The central yard is reserved for cattle. The elder's cattle are allotted to each of his wives according to her rank in the house. Cattle in possession of one side of the gate cannot be inherited by the other side. When inheritance takes place it is with great care that one tries to avoid cattle interchange.[16] The gate system, observes FOSBROOKE,[17] is an ideal, and "a symmetrically arranged gate is seldom found in practice". When people move in search of better grassland, the village is not destroyed, but simply evacuated. During the owner's absence the houses may be occupied by other temporary tenants. At the reverse migration the owner comes back to his old village if this is not irreparably decayed, and it is agreed by custom that any foreigner who might have found shelter in the house must vacate the place to the original owner. 621 361 [428] [166]

Another type of Masai village should be mentioned here. It is 621

*648 Resignation of Sir Charles Eliot.

The policy subsequently adopted by the Secretary of State for Foreign Affairs in dealing with applications for land, which had been received in respect of areas inhabited by the Masai, led to the resignation of Sir Charles Eliot, and hastened the concentration of the Masai within the confines of reserves set apart exclusively for their use, the policy which Sir Charles Eliot had maintained should be resorted to only in the last extremity.

*648 311 166 Mr. Hobley's investigations regarding Laikipia.

While he was acting Commissioner, Mr. Hobley continued to collect information on the subject of the Masai grazing grounds and came to the conclusion that the Masai were not effectively occupying at any period of the year more than one-fifth of that grazing. He considered, however, that the concentration of the Masai in certain portions of the Rift Valley could only be regarded as a tentative solution of the Masai question, while the final settlement of the problem could be attained by placing the whole of the Masai tribe on the Laikipia highlands. He described Laikipia as an extensive plateau stretching from Loroghi mountain on the north to the Uaso Narok on the south and south-east and bounded on the west by a steep escarpment. Until 1890, this plateau had been inhabited by a powerful branch of the Masai, called the Laikipia, who were in that year attacked and dispersed by the Purko division with the loss of all their cattle. The great cattle plague of 1891 killed off most of the Purko captures and they once more retired south leaving Laikipia practically unoccupied. The western part of the plateau was not so well watered as some of the Rift Valley, but the Masai reported that owing to better distribution and the considerable amount of rainfall the grazing was more dependable than and superior to that of the Rift, and had formerly carried much larger flocks and herds than those possessed by the Masai in 1904. The Masai also expressed themselves as quite satisfied in regard to the water supply on Laikipia and as willing to move from the Rift Valley to the plateau.

Sir Donald Stewart's views.

On his arrival in the Protectorate, Sir Donald Stewart gave immediate consideration to the matter and came to the conclusion that the removal of the Masai from the Rift Valley into two reserves was the only real settlement to the question. Masai and Europeans could never live together without endless trouble and friction; the Laikipia lands were well known to the Masai and well suited to them; they were some way removed from the Railway and not tempting to the settlers then in the Protectorate, though it was quite possible, he wrote, that when the Masai had grazed down the grass and got it sweet, envious eyes would be cast on their lands. He, therefore, emphasized the necessity of making these Laikipia lands an absolute native reserve for the Masai and asked that no applications for land by the settlers would be entertained within its limits.

Agreement of 1904.

On the 9th of August, 1904, he held a meeting with the Masai Chiefs at Naivasha, at which were present Lenana, Masikondi, Legalishu and other principal chiefs representing the Purko, Kakonyukye, Loita, Damat and L'Otayok sections of the tribe. After explaining the position to them, he asked if it was true that they were agreeable to move to other lands of their own free will and give up the Rift Valley to European settlement. They replied that they were willing to do so under certain conditions, which appeared to be reasonable, and Sir Donald Stewart made a formal agreement with them, embodying their requests. This agreement was translated to and signed by all of them, and the Commissioner also signed, with a proviso that the Secretary of State's approval was necessary before the agreement became valid. Later, he held another meeting with the Masai of the Kaputiei, Matapatu, L'Odo Kilani and Sighirari divisions, at which the same three head chiefs were present. The agreement was read over and explained to them and they asked to sign the paper. The text of this agreement, the "Masai Agreement of 1904," is to be found in Appendix 1.

The settlement arrived at was to be enduring "so long as the Masai as a race shall exist." Compensation was stipulated for in respect of a few small plots of cultivation (which would not amount to more than some two thousand rupees in all), and the Commissioner saw no objection to the reservation of a tract of land on Mount Kinangop for the exercise of their religious ceremonies connected with circumcision. The land which had been used in 1903 was situated seven miles

648*
311
166

to the north-east of Naivasha, in an open plain without either timber or water, and the land now asked for was some seven miles beyond, situated at the base of the hill Ngorinitu, along which runs a small though perpetual stream, the Nagarangata, and an area of some five square miles was considered sufficient for their requirements. A road area, half a mile broad, would be beaconed off as a path by which Masai could travel between the areas reserved for the two sections of the tribe and an administrative station would be established on Laikipia.*

Secretary of State's approval.

Lord Lansdowne conveyed his approval to the Agreement by telegram on the 15th of October, 1904 and by despatch on the 21st of that month, and in his despatch he concurred in the opinion that Masai and Europeans could never live together without friction. The remarkable influx of colonists from South Africa and elsewhere and the rapidly increasing number of applications for permission to settle in the Rift Valley lent force to these considerations. It was clear that the squatting of numerous colonists on the land over which the Masai flocks and herds had hitherto roamed without hinderance and the need of all new-comers to gain access to the principal watering-places must inevitably lead to disputes and probably to disturbances which might easily assume the shape of a bitter and vindictive struggle between the two races. This aspect of the case had come forward prominently owing to the fact that a large number of intending settlers had applied for grants which would practically absorb the best and most favoured grazing grounds of the Masai between Lakes Nakuru and Naivasha.

The Secretary of State recapitulated the position which had been arrived at with the East Africa Syndicate with whom arrangements were being made in June and July, 1903, for the grant to them of 500 square miles of land in the Naivasha Province, north and east of the Railway. It was not, he said, until the terms with the Syndicate had been finally arranged that he was warned that this grant, to which by that time the Government was committed, would materially curtail the best grazing grounds of the Masai; that the effect of large additional grants in the same vicinity would be to deprive the tribe of the best of their remaining pastures; or that the Masai had, in formal conference, only undertaken to raise no objection to the grant of the Syndicate land on the condition that the remaining grazing grounds were left to them.

He had, therefore, come to the conclusion that it would be advisable at least temporarily to exclude European settlers from the lands which still remained to the Masai in the Rift Valley after the grant of this concession, but he realized that this step was tantamount to the provisional creation of a Masai reserve in the Rift Valley. He, therefore, welcomed the solution of the problem proposed by Sir Donald Stewart in the form of the Agreement of 1904, by which the Masai would move from their old country and thus make it available for European colonization and which would involve the definite and permanent establishment of two reserves for the northern and southern sections of the tribe respectively.

The Secretary of State emphasised the fact that the definite acceptance of the policy of native reserves implied an absolute guarantee that the natives would, so long as they desired it, remain in undisputed and exclusive possession of the areas set aside for their use. In concluding his despatch, he remarked that the scheme submitted appeared to offer every possibility of a satisfactory solution of a difficult problem, and that he was the more glad to be able to express his approval, as it could probably not have been withheld without occasioning much disappointment to the Masai and shaking their confidence in the authorities of the Protectorate.

The Masai Move, 1904.

Steps were at once taken to move the Masai from the Rift Valley to Laikipia and from Nairobi to Ngong. The latter move was undertaken without difficulty, but some pressure had to be put on the Masai, of the Rift Valley, to induce them to leave their grazing grounds for the Northern Reserve. The separation of one

* On August 9th, 1904, the day on which Sir Donald Stewart met the Masai Chief at Naivasha, he signed the lease to the East Africa Syndicate Limited, the terms of which are alluded to in page 180. Though no reference is made in the Agreement with the Masai it must be presumed that the area so demised was excluded from the lands set apart for the Southern Masai Reserve by the Agreement of 1904.

*648
311
166

part of the tribe from the other was regarded with suspicion, it being suspected that the Government were adopting this policy in order that they might the more easily annihilate the tribe by defeating the sections each in turn. Further, almost immediately after the move commenced, it was found that the water supply there was totally inadequate for the requirements of the Masai.

The Masai, in fact, so neglected to carry out the terms of the agreement, as largely to destroy its meaning. Five sections, referred to as the Kiburgu, Gekunuki, Loita, Damat and Laitutok undertook to move absolutely to Laikipia. A considerable portion, estimated at about one quarter, of the first-named section remained in the Southern Reserve or in the uninhabited country between the Uaso Nyiro and Mara Rivers. The Kakonyukye (Gekunuki) moved from the neighbourhood of Naivasha to Il Melili and the southern slopes of the Mau. The Loita continued to occupy the Loita Hills and Plains. The Damat made use of the country watered by the Southern Uaso Nyiro and its tributaries and the last named section continued to inhabit the region to the north of Kilimanjaro.

Extension of the boundaries of the Northern Masai Reserve.

The boundaries of the Northern Masai Reserve had been fixed by the Agreement of 1904 as follows:—

On the north, the Loroghi Mountains.

On the west, the Laikipia Escarpment.

On the south, the Lesuswa or Nyam and the Uaso Narok, and

On the east, the Kisima.

A short while before his death, Sir Donald Stewart, realising that the area so enclosed was inadequate, promised an extension of the original boundary, but he died before he had been able to place on record what had occurred at a conference held with the representatives of the Masai and those settlers who had taken up land in the area proposed for this extension. The provisional boundaries agreed upon seem to have been:—

On the east of the Aberdare Range, the Uaso Nyiro.

On the west of the Aberdare Range, the southern boundary was the Equator and the western boundary the crest line of the Osobugo loo-'l-dian and the Laikipia Escarpment.

Further extension of the Reserve.

This extension, however, was insufficient, and Sir James Hayes Sadler, in February, 1906, proposed a further enlargement, making the southern boundary of the reserve the northern boundaries of the East Africa Syndicate land, the eastern boundary the Uaso Nyiro, and the western boundary the crest of the Osobugo loo-'l-dian, as before. Several settlers, who were under the necessity of vacating their land, were compensated by additional grants elsewhere.

Northern Reserve a Closed District.

By a Proclamation, dated the 30th of May, 1906, the Northern Masai Reserve, whose boundaries are therein defined, was declared a closed district.

The further extension of the Northern Reserve.

On April 6, 1906, the Secretary of State signified his concurrence with these proposals. But the Northern Masai were still discontented. Their stock, after the removal from the somewhat foul grounds of the Rift Valley, had increased enormously, and at least once every year they had to break the boundaries of their reserve, both on the East and on the South, the grazing within the reserve allotted to them being insufficient. On the East they were permitted, every dry season, to cross the Uaso Nyiro and pasture their herds and flocks between that river and the Uaso Nanyokye, *i.e.*, over an area of 200 square miles outside their reserve. On the South, they settled on the shores of Lake Ol Bolossat, and Sir James Hayes Sadler asked, on November 23, 1906, that these grazing grounds might be relinquished by the East Africa Syndicate in exchange for land elsewhere, the lands so relinquished to be handed over to the Masai. No agreement, however, was come to with the East Africa Syndicate, and although this area was much used by the Masai, it never actually formed part of their reserve.

In the year 1907 there was a partial failure of rains and the Masai were allowed to break their boundaries eastwards across the Uaso Nyiro, southwards towards Mount Kippiperi, and westwards towards Lake Solai. Their stock was estimated by Mr. Collyer, the District Commissioner Rumuruti, at 70,000 head of cattle, and 1,750,000 sheep and goats, and it was amply demonstrated that, for their large and increasing herds, the grazing to be found in the Northern Reserve would be totally inadequate in a period of severe drought. It was suggested that the time was opportune for inducing the Masai to part with their superfluous cattle, but proposals were also considered for the permanent and final extension of their reserve. On September 23rd, 1908, Sir J. Hayes Sadler forwarded to the Colonial Office a recommendation made by Mr. Bagge, that the 200 square miles east of the Uaso Nyiro should be definitely added to the reserve, but no extension of this nature was made and the subject was dropped, when more detailed consideration was given to the possibility of moving all the Masai from the Northern Reserve.

Proposals to extend the Northern Reserve.

648* 311 166 131

When the move of the Northern Masai was started at the end of 1904, the Provincial Commissioner at Naivasha thought it would be advisable to keep a few Masai near the Government station, in order that Europeans of the Rift Valley might the more easily obtain the services of herdsmen and servants. These Masai, of the Kakonyukye division, were allowed to settle with their cattle on Government land. The rapid increase of the stock belonging to the Purko Masai, on Laikipia, caused an insufficiency of pasturage for the Kakonyukye Masai, who had moved north from the Rift Valley and these latter, therefore, gradually returned to join their friends and relations near Naivasha. They took up their residence on all the unoccupied farms, squatted on the East Africa Syndicate land, grazed over the whole of the Commonage, and became a general nuisance. They were repeatedly warned by Mr. Bagge and others that they must leave Naivasha, but the move was not undertaken until 1910, when they went to the Loita Plains, to the west of the Masai Southern Reserve, afterwards called the extended Southern Reserve, taking with them some 10,000 head of cattle and 30,000 sheep and goats.

The Kakonyukye Division.

648* 311 166

In addition to these Kakonyukye Masai, there lived in the Loita Plains about 2,000 Masai, with 20,000 cattle and half a million sheep and goats. Some of these were Sendeu's (Loita) Masai, whilst others were Purko Masai, who, instead of moving to Laikipia in 1904, went South and occupied what was at the time an unexplored region.

Purko on the Loita Plains.

In the year 1908, various suggestions were made with a view to moving the Masai from the Northern Reserve to the area lying between the Mara River and the Southern Uaso Nyiro. This country, like Laikipia, had formerly been occupied by various sections of the Masai, the Loita, L'Otayok and Damat, who had, for the most part, disappeared from the area. The suggestion to move the Masai was undoubtedly made in the interests of European settlers, some of whom had cast envous eyes on the grazing grounds of Laikipia, as Sir Donald Stewart had prophesied when submitting the Masai Agreement of 1904.

The suggested removal from Laikipia.

In the month of December, 1908, Mr. McClure and Captain Monckton, the Assistant District Commissioners of Ngong and Sotik, after extensive tours through the Loita country, submitted reports in which it was stated that the area south of Sotik and between the Uaso Nyiro and the Mara River, comprised some 2,300 square miles, of which 1,300 square miles were waterless. The Masai population numbered approximately 2,270, with 20,000 cattle and 100,000 sheep. The land, as a whole, was unsuitable for European settlement, though several areas might be regarded as good farming land, but these were so disconnected, as to render impossible their proper supervision. Further, permanent streams were so far apart as to preclude the possibility of allotting such farms on a continuous system. The land was generally suited to the requirements of a nomadic and pastoral tribe such as the Masai.

Reports on Loita.

On the 4th of January, 1909, the Governor mentioned the proposal to Lenana, and somewhat to his surprise, found that the Laibon was entirely in favour of it, provided that the settlers left the suggested area, but he doubted whether the

Lenana's views.

*648
311
166

water in that country was sufficient for the requirements of the Northern Masai. Lenana's main object in recommending the move was to re-amalgamate the various sections of the tribe, in order to enable him once more to exercise direct control over all his followers. Ever since the removal of the Northern Masai to Laikipia, he had found his authority to be waning. The Rift Valley Masai had been separated more from the Nairobi Masai than Lenana had expected when the Agreement was signed. This separation was, to a large extent due to the fact that the Government had failed to carry out all the conditions of the treaty. The road half-a-mile broad, which was to have been left inalienated between the reserves had been reduced to such an extent that it was practically useless for cattle, and the land on either side had been leased to Europeans. In August, 1908, the movement of cattle between the reserves was altogether prohibited, owing to quarantine regulations, and the Masai of Laikipia were thus, to all intents and purposes, cut off from their Laibon at Ngong. Legalishu, who was present at the meeting, could not be induced to give his opinion on the subject. The Governor stated that the question of the move would not be contemplated by the Government unless it was in accord with the expressed wishes of the Masai, and he refused to comply with Lenana's suggestion that the matter might be settled without delay, for he considered that further investigation was necessary to ascertain whether the suggested area was suitable for the accommodation of the Northern Masai.

Reports on the Loita Plains.

As Lenana was so much in favour of the move, and as the reports sent in by Mr. McClure and Captain Monckton, though not enthusiastic, had been sufficiently encouraging, the Governor gave orders for two senior officers to inspect the country, and Messrs. Bagge and Hollis were entrusted with this work. The driest season of the year, March, was chosen in order that the country might be seen at its worst, and an extended tour was made through a part of Mau, Il-Melili, Ngatet and the Loita Plains to the Mara River, thence along the Anglo-German frontier, the Loita Hills and the Southern Uaso Nyiro to Naivasha. The gist of the reports submitted by these officers was that the land and grazing were, on the whole, good, but that there was an insufficiency of water and, much as they would like to see all the Masai concentrated in one reserve, they could not recommend the move until steps had been taken to irrigate the land, and until the settlers who were living in the area had been given farms elsewhere. Mr. Bagge, however, pointed out that the inclusion in the reserve of any of the country known as the Mau Plateau had not been considered, and that it was probable that by engineering works the water supply might be considerably increased. He suggested that an engineer should be sent into the area to report on the prospects of irrigation near the l'Ongaianet River.

Irrigation of the Loita Plains.

On Sir J. Hayes Sadler's departure from East Africa, Mr. Jackson instructed Mr. Watts, the Commissioner of Public Works, to visit the Loita Plains, and to report on the possibility of irrigation. At the same time, the settlers in the area which might be allotted to the Masai, were to be approached with a view to ascertaining if they would be prepared to move, should the scheme be carried through on consideration of receiving compensation on Laikipia or in the vicinity, to the extent of their present holdings, plus half as much again. Mr. Watts drew up an elaborate report and showed that by the expenditure of £5,280 the whole of the area could be watered. He also estimated that after deducting 1¾ million acres for grazing of game, forest and waste areas, there remained 2¼ million acres of good grazing land available for the support of 150,000 cattle and 1,200,000 sheep, reckoning seven acres per cow and one acre per sheep. A sum of £2,000 was inserted in the Estimates for 1910-1911 as a commencement for the irrigation scheme, but was disallowed by the Secretary of State.

E-Unoto Ceremony, 1910.

In August, 1909, the District Commissioner of the Northern Masai Reserve reported that the Purko warriors wished shortly to proceed to the Kinangop reservation which had been set aside for the E-Unoto ceremonies, and to take some 10,000 cattle with them. The Purko Masai living in the Loita Plains likewise asked, through Lenana, for permission to proceed to Kinangop. Arrangements were made with the East Africa Syndicate, and the Northern Masai were

permitted to take their cattle to the Kinangop Reserve, but, although the Masai living in the Loita Plains were informed that they themselves might go to Kinangop, they were forbidden to take their cattle with them for fear of infecting, with East Coast fever, the stock belonging to the European farmers through whose lands they would have to pass, and of carrying this disease to the Northern Reserve. 648* 311 166 561

By December, the Northern Masai, with 10,000 cattle but unaccompanied by their principal chiefs, Masikondi and Legalishu, had moved to Kinangop, but the ceremonies were commenced prematurely, for Lenana, on hearing that the Southern Purko might not take their cattle with them, withheld his sanction, which is necessary, according to the custom of the tribe, before a start can be made. On January 14th, 1910, he sent orders to Kinangop for the warriors to proceed with their cattle to the Southern Reserve in order to hold the ceremony at Ngong. At the same time he appealed to the Governor and pointed out that, unless his authority were recognized and his instructions obeyed, he feared a disruption between the two sections of the tribe.

On February 2nd, Sir Percy Girouard held a meeting at Nairobi, at which were present Lenana and those elders of the Northern Reserve that were taking part in the ceremony on Kinangop. Lenana made a direct appeal to the Governor, and stated that the condition of affairs which had arisen since the last E-Unoto ceremony, whereby free inter-communication between the two sections of the tribe had become impossible, was gradually but surely disintegrating his authority, a matter of great regret both to himself and to his people. It was, he explained, an unheard of thing that there should be two ceremonies for one section of the tribe, one on Kinangop and the other at Ngong, and, since the Southern Masai were forbidden to take their cattle to Kinangop, he desired the Northern Masai to proceed to Ngong to hold the ceremony there. He further stated that it was his most earnest wish that all the Northern Masai should move from Laikipia and inhabit the proposed extended Southern Reserve. The Governor informed Lenana that he could not sanction the move of all the Masai without consulting Masikondi and Legalishu, but, as regards the ceremony, he was quite willing that it should be held at Ngong if that was Lenana's wish and if he could arrange matters with the people concerned. The Masai elders then proceeded to Lenana's kraal to discuss the matter with him there, with the result that they returned to Kinangop, and, having collected their cattle, proceeded with the warriors to the Southern Reserve. It was, fortunately, unnecessary for the Government actively to intervene in support of the Laibon.

Meeting at Kiserian.

On February 24th, 1910, a second meeting was held at a camp known as Kiserian, close to Lenana's kraal near Ngong, with the Masai. At this meeting there were present, besides Lenana, Masikondi and Legalishu, respectively the senior elder and the spokesman of the senior warriors (who are generally referred to as the two chiefs) of the Northern Masai. These two representatives of the Northern Reserve not only agreed to the suggested move but expressed themselves in favour of it. It was accordingly proposed to carry it out as soon after the rains had commenced as practicable. 648* 311 166

The Commissioner Mr.

Mr. Collyer, the District Commissioner of the Northern Reserve, was appointed Special Commissioner for the move, and, as several Provinces and interests were affected, he was directed to correspond with the Secretary for Native Affairs, who was to arrange the details, and submit recommendations for the displacement of the white settlers from the Southern Uaso Nyiro.

Everything went well. The majority of settlers were public spirited enough to consent to the Masai passing over their farms, and four separate routes were arranged. Special officers were deputed to accompany the mobs of cattle and a survey was commenced on Laikipia for farms to which the settlers from the Southern Uaso Nyiro might proceed.

In April, gastro-enteritis, which for some time past had been prevalent all along the line from Naivasha to Kisumu as well as in the northern Masai Reserve, broke out among the Masai herds in epidemic form. It is possible that this had [232]

*648
311
166
D32]

something to do with the readiness of the Masai to move, for their methods of quarantine are to quit foul ground and drive their herds on to fresh pastures. Be that as it may, the Masai started towards the middle of April of their own accord, and before the Government was really ready, those from the extreme north of the reserve pressing south, and those on the southern boundaries leaving the reserve by the routes that had been arranged. The drought may have expedited their movements, for no rain had fallen in the Northern Masai Reserve whilst there had been a plentiful quantity on the Loita Plains, on Mau, and near the railway.

The Move Suspended.

On April 20th, 1910, a telegram was received from the Secretary of State ordering the move to be suspended and before the end of the month, steps had to be taken to send the Masai back to their reserve. The Secretary of State's telegram was followed by a despatch, dated April 22nd, 1910, intimating that, inasmuch as the agreement signed in 1904 was solemn and binding, it could not be cancelled without the clearest proof that the proposed agreement was in accordance with the wishes of the Masai and especially of the northern section. A document must be procured of equal formality with that of 1904 and must be signed by an equally representative body of Masai. Owing to the severe form which the cattle disease had taken, it is probable that the move could not have been undertaken in any case for fear of infecting the stock on European farms and in the Loita Plains, and this was made the excuse for the postponement. But the Masai were neither willing nor, indeed, able to remain in their reserve, for there was very little grazing owing to the drought and the ground was foul; and before many weeks were past, between twenty and thirty thousand cattle had been driven across the Northern Uaso Nyiro. Permission was afterwards granted to the Masai to occupy the 300 square miles between the Rivers Nyiro and Nanyokye.

The Meeting of May 20, 1910.

On May 20th another meeting was held at Ngong, and a provisional agreement was entered into between the Governor and the Masai, according to the terms of which the tribesmen, being satisfied that it was to their best interests that the Masai people should inhabit one area, and not be divided into two sections, as must arise under the treaty of 1904, agreed to move from Lelikipia to the Loita Plains, when the Governor should notify them. There were present, as representatives of the Masai, Lenana, Mashonoli, and Legalishu, Sabori (whose position in the Southern Reserve was analogous to Mashonoli's in the Northern Reserve), the heads of clans, *i.e.*, the principal elders, of the Northern Reserve, and the spokesmen of the senior, the junior, and the coming age-groups of warriors. The Governor was supported by Messrs. Hobley and Lane, Provincial Commissioners, Mr. Combe, Crown Advocate, Mr. Hollis, Secretary for Native Affairs, and Mr. Collyer, the District Commissioner of the Northern Reserve. The Rev. Dr. Scott was also present as an independent witness. The agreement which was entered into by the Masai of their own free will, was translated and fully explained to them. There was, however, one dissentient voice, and, during the discussion which preceded the signing of the agreement, Legalishu said he did not consider the new area large enough. The Governor informed the Masai that the move, if it was to take place at all, must be a voluntary one, and he asked Lenana, Mashonoli, and Legalishu to depute representatives to visit the country with Mr. Collyer. He further promised the Masai that, if they did not wish to move, they need not do so, and that if they did move, and the area was found to be too small, the country across the Mara River towards Kisii would be included in their territory. Before a final agreement could be entered into, the return of the party that would go and inspect the land would be awaited, and their report considered.

Mr. Collyer's visit to the Loita country.

Mr. Collyer spent two months in the Loita Plains, on Mau, and Ngatot, and in the Il-Molili country. The two men from the Northern Reserve who accompanied the party were both nominated by Legalishu, and, when they returned to Lelikipia in August, they reported that the proposed area was too small, that there was an insufficiency of water, and that the Kisii would steal their cattle. This report was accepted by the chiefs and elders of the northern section, and a large gathering, led by Mashonoli and Legalishu, met at Rumuruti, on August 27th, 1910, to

640*
311
166

before Mr. Collyer, the District Commissioner, eighteen decisions. They said that, as their Laibons wished them to move, they were ready to go if the Government ordered them to do so, but that they did not wish to leave Laikipia. As this was their determination, no attempt was made to influence them, no pressure was put upon them, and the subject was not again broached to them.

640*

941

The death of Lenana.

On March 7th, 1911, Lenana died. He had been suffering from dysentery for a month, but was getting better, when he suddenly collapsed. The Assistant District Commissioner in charge of the Southern Masai Reserve, Mr. Crewe-Read, was with him a few hours before his death, and discussed various minor questions with him. Lenana did not mentioned his successor, as is the custom with the Masai Laibons, for he only realized a short time before he died, that his last hour had come, but, when he felt he was dying, he made the following speech in the presence of numerous witnesses:—

"Tell the Government to look after my children and to give them the money which I should have earned if I had been alive. Tell my people to obey the Government as they have done during my life. Tell the Laikipia Masai to move with their cattle to the Loita Plains."

April 2nd was fixed upon as the date for a meeting with the Masai representatives of both the Northern and Southern Reserves in order to select a successor to Lenana. Mashonoi, the senior elder of the Northern Masai, was too unwell to proceed to Ngong, but he delegated his powers to two of the members of his clan. Legalishu, with the other heads of the clans and the spokesmen of the various age-grades from the Northern and Southern Reserves, were present, and the proceedings were watched on behalf of the Government by Mr. Lane, Provincial Commissioner of Naivasha, Mr. Hollis, Secretary for Native Affairs, and Mr. Crewe-Read. Seggi, Lenana's eldest surviving son, a youth of thirteen years of age, was unanimously chosen as Laibon. Owing to his youth, it was decided to appoint two Regents to assist him in governing his people, one for the Southern and one for the Northern Reserve. Sipuroro, a cousin of Lenana, was selected as Regent for the south, and Legalishu for the north. When these nominations were concluded, Legalishu stated, on behalf of the Northern Masai, that he wished to ask that they might be permitted to move to the extended Southern Reserve. This change of opinion was undoubtedly due partly to the dying wishes of Lenana and partly to a fear of disruption between the two sections of the tribe. On the other representative expressing a like request, the Masai were informed by their Provincial Commissioner that they would have to proceed to Nairobi and approach the Governor personally on the matter.

[819]

The agreement of 1911.

640*
311
166

Sir Percy Girouard held a meeting with the Masai representatives on April 3rd, 1911, in Nairobi. Legalishu, as spokesman of the Northern Masai, again stated that it was their wish to move to the extended Southern Reserve. The Governor repeated that, if the move were to take place, it must be a voluntary one, that the Masai were completely free to accept or reject the proposed arrangement, and that, if they did reject it, the pledges made to them by the Government in 1904, would be scrupulously adhered to. They thereupon replied that it was their own wish that they might be allowed to move. A formal treaty was drafted, and another meeting was held on April 6th. The members of the Executive Council and the Provincial Commissioners were summoned, and, in the presence of all, the Governor asked the Masai whether or not they wished to move to the extended Southern Reserve. The reply was again in the affirmative. Several minor points were then discussed, Legalishu acting as spokesman. The principal matter was the water question. The Masai stated that, if the Government would help to improve the water supply, they themselves would contribute towards the work by the payment of hut-tax. They requested that all Europeans should be removed from the area, and that as much as possible of the area known as "The Prescribed Land," which had been applied for by Mr. Percy Cobb, should be given to them. Protection from possible birth raids was asked for and granted. Finally, the Masai begged to be allowed to start the move as soon as there was sufficient grass along the routes, and asked that they might not be hurried. They were informed in reply, that the move was contingent on the approval of Sir

#CA8 311 166

Majesty the King, and that, if they were permitted to move, they would be allowed to proceed slowly. After this, the treaty was translated and fully explained to them, and the Masai affixed their marks in the presence of the European officers. The treaty was then sent to Ramsayeli to ascertain if Mashkoeli and each of the old men as were too infirm to attend the meeting at Ngong approved of the terms.

The agreement, as drafted, was submitted to the Secretary of State, who approved of its terms, by telegram, on the 29th of May, and by despatch on the 3rd of June, 1911.

The Masai Move of 1911.

The Masai were accordingly informed that the Government had agreed to their moving from the Northern Reserve into an extended Southern Reserve. The move was arranged to proceed along four routes throughout June, July and August. No compulsion of any kind was used, and administrative and veterinary officers were detailed to escort the stocks of cattle across the European farms.

Congestion on the Move.

One of the routes, which proceeded by Lake Naivasha, went straight into the extended Southern Reserve, and those Masai who travelled by this route soon reached the Loita Plains. The other three routes converged on the top of the Mau into "The Promised Land." The first Masai to arrive on the plateau went right through to their destination, but the succeeding parties, finding the grazing good, remained, erected their kraals, and decided not to push forward into the plains below. Unfortunately, no precautions were taken to induce them to leave the plateau, and there was consequently a great congestion at the commencement of the heavy rains, which usually fall on the Mau towards the end of August and in September. The roads became impassable, and the people and stock suffered from cold and discomfort. They accordingly returned to the European farms lying between Njoro and Elmentaita Stations on the Uganda Railway.

Masai to return north.

In consequence of this check, the Secretary for Native Affairs and the Director of Agriculture were sent, on August 21st, to investigate the situation, and they reported that there was nothing to show that the move was other than temporarily checked. It had, however, considerably affected the views of some of the people, and a desire appeared, more particularly on the part of Legalishu, to return to the north.

Masai removed to Lalkipia.

As it was impossible for the Masai to remain on European farms near the Railway for any length of time, the Governor issued directions for them to be sent back to the southern part of Lalkipia, and to the land belonging to the East Africa Syndicate, adjacent to the former Northern Masai Reserve. The carrying out of the necessary arrangements were entrusted to Mr. John Ainsworth, Provincial Commissioner, Kisumu, who met the Masai representatives at Elmentaita and Nakuru early in September. Mr. J. K. Hill placed 100,000 acres of Syndicate land at the disposal of the natives, and the move outwards into this land was completed by September 18th.

Character of the Move.

This check was undoubtedly the result of the Masai having proceeded too quickly. They pressed forward even when asked by European farmers (through whose farms they were passing) to hold back, the farmers being desirous of trying to come up a trade with them. No police measures of any kind were adopted, testifying to the voluntary character of the move. It appears that the Masai did not suffer to any extent by the journey, and the losses reported were those which would naturally take place in large movements of stock.

#CA8 311 166 420

Under-estimation of Masai stock.

The move had brought to light one matter of importance; previous estimates of the number of stock possessed by the Northern Masai had been greatly underestimated, and the probable figure was computed at 200,000 cattle and 2,000,000 sheep, a large increase over the original estimate, made in 1911, of 60,000 cattle and 1,000,000 sheep. That such an error should have been made is accounted for by the superstitious opposition of the Masai to the counting of any of their stock.

Report on Extended Southern Masai Reserve.

A report submitted by the Director of Agriculture at this time stated that the extended Southern Reserve was, more or less, fully stocked, partly owing to the fact that those Masai who had originally occupied the Southern Reserve had broken their boundaries, and driven their flocks and herds into the extended reserve, and partly owing to the arrival of 50,000 cattle and half-a-million sheep from Laikipia: The extended reserve was, however, stated to be capable of holding more stock if necessary, and investigations were immediately made regarding the suitability of the land across the Mara River.

Trans in the Ol-Orokuti.

The tour of investigation was undertaken by the Director of Agriculture and the Director of Public Works, and the report sent in was to the effect that the area available consisted of one million acres of the finest grazing land in the Protectorate, exceedingly well-watered, and superior to the former Northern Reserve. The country was practically uninhabited, owing, it was said, to the fact that some years before the Masai who then occupied the country were decimated by small-pox while, simultaneously, almost all their cattle died from rinderpest. Messrs. J. K. Hill and C. O'N. Chaplin, two prominent settlers, accompanied the Director of Agriculture on his tour, and submitted separate reports, testifying to the excellent quality of the land in question as a grazing area. In view of the eminent desirability of including all the Masai in one reserve, the Governor felt compelled to recommend that this further area should be allotted to the Masai.

Laikipia compared with the Southern Extension.

The position at this point was that an area of 4,300 square miles on Laikipia, of which not more than 1,200 was well-watered, was to be exchanged for 6,500 square miles in the south, of which 1,500 was described as some of the best stock country in British East Africa, and through the remaining 5,000 square miles of which flowed the perennial rivers, the Mara and Uaso Nyiro. It was further stated that the whole of this southern area was free from tsetse fly or other disease-carrying fly.

The Move suspended.

Meanwhile, on receipt of information respecting the check in the move, the Secretary of State had wired instructions that those natives who had not been provided with suitable accommodation in the south must be immediately provided for in the Northern Reserve. They could not be allowed to remain on private lands without giving rise to future difficulties, and the whole question of an eventual move must be suspended until the suitability and capacity of the new reserve had been thoroughly examined, it had been inspected by representatives of the Northern Masai, and until their full and free assent to the resumption of the move had been obtained. The actual move, if these conditions were fulfilled, must not be made until the Governor had satisfied the Secretary of State that an adequate water supply would be immediately available, and that the preparations for proper supervision of the move were complete.

Census of Masai on Laikipia.

After the check which took place in 1911, and the subsequent withdrawal on to European farms, the Masai returned to the Northern Reserve. Officers were immediately detailed to make a census of the Masai on Laikipia, and the returns showed a population of not more than 4,000 adults, together with 100,000 cattle and 1,068,100 sheep. It was calculated at the same time that there was, in the Southern and extended Southern Reserves, accommodation for 331,000 cattle; and it was therefore decided that the extensions of the Southern Reserve were more than capable of holding all the Masai stock from the north.

Trans in the Ol-Orokuti.

In November, 1911, six elders and a few warriors from the Northern Reserve accompanied Mr. R. W. Hemsted on a tour of inspection of the trans-Mara country. They were shown every part of the Ol-Orokuti (trans-Mara) area, and unanimously expressed the opinion that the country was eminently suitable for the Masai and their cattle.

In the same month Legalishu deputed four elders to visit the district, and these elders accompanied by Mr. Hemsted, toured the Ol-Orokuti for fourteen days. Their opinion on the area was not expressed, and they returned nothing but evasive answers, at the same time admitting that the grazing was sufficient and the water supply adequate.

Meeting at Naivasha.

On the 10th of February, 1912, a meeting was held at Naivasha between the representatives of Masai from the Northern, Southern and extended Southern Reserves and the Secretary for Native Affairs (Mr. Hollis), supported by the Provincial Commissioner, Naivasha and several other administrative officers. There were present Masikondi and Legalishu with some thirty elders of the Northern Reserve, Ngaroya, the Regent of the Southern Reserve, carrying the iron club, as representing the Laibon, Ole Kotikosh and other Purko Masai, who had already moved into the extended Southern Reserve, and Ol le Seti with other Kakonyukye Masai. Legalishu and Masikondi stated that they did not now wish to move and that they believed the country offered to them in exchange for Laikipia was inadequate. Ngaroya said that he was authorised to inform them that it was the Laibon's wish that they should move south and so reunite the tribe, but the northern chiefs declined to carry out this wish of the Laibon. Ole Kotikosh expressed the desire of the rest of the Purko division to be allowed to proceed with the move south, and Ol le Seti stated that most of the Kakonyukye were already in the extended Southern Reserve and that the remainder wished to follow. As a result of this meeting the members of the Purko division who had remained in the north were permitted to move with their cattle, and arrangements for the move were entrusted to the Provincial Commissioner, Naivasha, on the 18th of February. The influence against the move exerted by Legalishu, however, was so great that although several of the Purko wished to proceed they were prevented from doing so, and small success attended a visit to Laikipia carried out by Ngaroya and Ole Kotikosh with a view to using their influence in favour of the move.

Directions to the Masai for move.

On the 8th of May, while Sir Percy Girouard was on leave in England, the Secretary of State decided that the Masai should be directed to move to the Southern from the Northern Reserve, but he gave instructions that the lands vacated in the north must not be dealt with in any way until the matter had received his approval.

Arrangements for the move.

Arrangements for the move were at once put in hand. On the 10th of May, Mr. Bowring, the Acting Governor, proceeded to Naivasha accompanied by Mr. Hollis, Dr. Milne, the Principal Medical Officer, and Mr. Brandt, Acting Chief Veterinary Officer, in order to discuss with Mr. McClellan and the local officials the details of the move. Two routes only were to be used, one via Elmentaita and across the Mau by the road known as "The Promised Land," and the other via Gilgil and Elburu and across the Mau near Lake Naivasha. A broad track, twenty-five miles long, had been cut through the forest from the western slopes of Mau to the Mara River. Not more than 10,000 cattle were to be allowed to move in the first instance by each route and no further mobs were to follow until the first ones had settled down. Adequate arrangements were made for the supervision of the move and medical and veterinary officers were provided.

Meeting at Naivasha, 21st May, 1912.

On the 21st of May, a meeting was held at Naivasha when it was explained to the Masai that the Government had decided that the terms of the treaty entered into on April 2nd, 1911, should be kept and that the northern Masai would be required to move. The chiefs offered no opposition, and, indeed, appeared to be relieved that the Government had come to a decision on the matter. Ngaroya, the Regent of the Southern Reserve, expressed his thanks on behalf of the Laibon and stated that it was a great satisfaction to all the Masai to know that they would be brought together again and not be divided into two sections. Legalishu agreed to move with the first batch and to help the others to settle after they had crossed the Mau.

The "Masai Case."

On the 28th of June, 1912, Mr. A. Morrison addressed the Colonial Office, intimating that he, in company with Mr. A. D. Hume and Mr. A. W. Buckland, had been instructed to act for Legalishu in the taking of legal proceedings against the Government on behalf of the Masai. Action was brought in the High Court by Ol le Njogo and others against the Attorney General and others in May, 1913, and the case was dismissed with costs by the Chief Justice. An appeal was made to the Court of Appeal for Eastern Africa in December, 1913, but the appeal was dismissed with costs. Conditional leave to appeal to the Privy Council was

648* 31 166

granted, but lapsed owing to the appellants failing to give security for costs. Further details of the proceedings will be found in Appendix 3.

While the move was in progress the question of the allotment of land to settlers who were affected by the removal of the Masai from Laikipia was brought up. The claimants fall into two distinct categories, viz. :—

Allotment of land to Settlers.

(1) Those who, in 1904, abandoned their farms, or claims to farms, on Laikipia in order to make room for the Masai who were, in that year, settled in the Northern Reserve: and

(2) Those who had abandoned their farms in the Lemek Valley and in the Southern Uaso Nyiro in connection with the move then progressing.

The original intention in respect of those of the first class was to make grants of land to them elsewhere. These Laikipia settlers were allowed time to make their selections, but, before these selections had been made, the removal of the Masai from Laikipia was mooted and the settlers preferred to wait in the hope of being, after all, able to take up their land on Laikipia as originally intended. The negotiations for the surrender of claims of those settlers who came within the second category were begun in 1909, and were carried out on the basis of a grant of land equal in area to that surrendered in the Southern Reserve, plus fifty per cent., or a sum of money, by way of compensation for improvements, if any. It was understood that no definite promises had been made that the Laikipia lands would be available for exchange, but there was little doubt that it had been taken for granted that this would be the case. Mr. Bowring consequently suggested that, in offering farms to claimants efforts should be made to offer farms approximately equal in value to the land to which the claimants would be entitled on Laikipia, were this land available. At the same time they would be given the alternative of waiting in the hope of being eventually granted land on Laikipia. The Secretary of State considered it desirable, from the public point of view, that no one who was to be compensated in connection with the movement of the Masai should be granted such compensation on Laikipia. He further directed that the claims should be satisfied purely on the basis of area, without reference to the hypothetical value of Laikipia lands. The satisfaction of such claims was to take precedence, within a reasonable limit of time, of any further general allotment of Crown Lands.

On the 23rd of October, 1912, further facts were telegraphed to the Secretary of State regarding the lands on Laikipia. It appears that, on April 7th, 1910, the Commissioner of Lands had informed the Governor that the result of the negotiations with the Masai would be the granting of approximately 200,000 acres on Laikipia. On April the 13th, the Governor had accepted the Commissioner's proposals, and, on that authority, the Land Office had informed the parties concerned that, if they surrendered their land in the Southern Reserve, they would be given areas in the Northern Reserve or its vicinity when the move had been accomplished. Similar promises had been made by the Governor to Major the Hon. R. F. Carnegie and Lady Southesk on the 14th of June, 1910. Sir Henry Belfield was therefore of opinion that the Government was under a legal obligation to fulfil the promise made on the completion of the move. He anticipated the most serious results if land on Laikipia was now refused to claimants. All the Southern Reserve farmers confidently expected to receive one and a half times their previous holdings out of the lands to be vacated by the Masai and the Governor feared that there was no chance of their accepting land elsewhere.

On receipt of this information the Secretary of State concurred in the view that the Government was committed to the grant of lands vacated by the northern Masai to the claimants in question and felt reluctantly compelled to discard the principles which he had previously laid down. He therefore directed that the obligations entered into in 1910 must be discharged, and as the land, if left vacant for any length of time, could only become useless, or at any rate, greatly impoverished, he approved of arrangements being made for the necessary grants, due regard being had to any prior claims which ought to be admitted to lands on Laikipia in view of the fact that the claimants surrendered their holdings there when the Masai were transferred from the Rift Valley in 1904.

*648 166 311

The Meeting of December 5th, 1912.

On December 5th, 1912, the Governor met the Masai chiefs at Nakuru. The remarks then made by Legalishu and his adherents were evasive, and no attempt was made to express their true feelings in the matter or to disclose their reasons for taking legal proceedings against the Government. The Governor was of opinion that only a minority of the tribal elders, headed by Legalishu and Masikondi, were responsible for this action, ostensibily on behalf of their tribe, and that the personal avidity and ambition of those two men were doubtless contributory causes of their organized opposition to the approved Government policy. Those who opposed the move had no valid ground for their objection as to the unsuitability of the new country to which they were being moved.

Completion of the move.

On the 9th of April, 1913, Sir Henry Belfield informed the Secretary of State that the Masai move was completed. With the exception of Il Dala Lekutuk division all the Laikipia Masai were located in the extended Reserve, while that division, after remaining for some months on the Uaso Nyiro, moved to the Kaputiei country and settled there. Reports showed that the losses suffered by the Masai on account of the move had been very small. Rinderpest was rife, both in Laikipia and the south, from which many hundreds of beasts died, but the veterinary officers who were in charge of both areas did all that was possible to prevent the spread of the disease. Sheep suffered on one or two occasions, but only a few succumbed. Two drifts were being used, each with an officer in control, and of the thousands of sheep at these drifts not one was lost. The death rate of the Masai themselves, directly attributable to the move, was probably nil. On the whole, the Masai behaved well throughout, and there was very little friction with settlers. Statistics show that the number of Masai moved between the 10th of June, 1912, and the 27th of March, 1913, was 462 warriors, 1,820 other males, 4,031 women and 3,751 children, a total of 10,064 souls, while nearly 200,000 head of cattle and 550,000 sheep were counted. The number of sheep is probably very greatly underestimated. The Secretary of State expressed his appreciation of the manner in which the delicate and difficult task had been performed.

Attitude of the Masai after the move.

On the completion of the move the Purko division evinced a considerable disinclination to cross the Mara River, but no steps were taken to induce them to do so and a large number of Masai, including all the Purko Muran, moved into the trans-Mara region in September, 1913.

The Masai did not, on the whole, settle down contentedly in their new surroundings and they showed a disposition to make the worst of everything. Complaints were incessant that the country was unsuitable for them and for their stock, and every device short of active resistance was employed to obstruct the Administration and to defeat the ends of justice. Information concerning crimes was withheld, and escaped prisoners were assisted and harboured. Chiefs and elders proved anything but helpful and were occasionally almost defiant. The "Masai Case" was undoubtedly responsible for much of this feeling, but it is also probable that the natives resented the closer administration which had been rendered possible by the amalgamation of the two reserves.

This discontented feeling began to disappear some six months after the completion of the move and raids, murders and stock thefts decreased in number. Two years after their arrival the Masai could be described as contented and happy in spite of their dissatisfied disposition.

Disputes with previous residents.

Prior to the arrival of the Masai from Laikipia, the country constituting the extended Southern Reserve had been occupied by members of the Loita, Damat, Kakonyukye and Siria tribal divisions as well as by about one-quarter of the Purko division. These sections had undertaken to move to Laikipia in 1904, but succeeded in evading the terms of their agreement with the Government and, while admitting that they had no claim to the land, occupied the area and came to regard it as their own. By these Masai the arrival of their fellows from Laikipia was resented, while the latter were displeased at finding the best grazing grounds already taken up. A considerable amount of friction ensued, more particularly between the Purko and Il Damat divisions.

Section 10.—THE WATER SUPPLY.

Tour by Mr. McClure and Captain Hawkins. Tour by Messrs. Beggs and Hollis. Tour by Mr. Watts. Government liability to improve water supply. Boring at Sakuru. The Tsavo Dam area. The Magadi area—Mr. Percy Grant's proposal. Mr. Cockayne's work. Mr. Hole's proposals. The engagement of Mr. Watts. Necessary improvements. The construction of the Lesuth Dam. Recommendations by Messrs. Watts and Hemsted. The completion of the Lesuth Valley Dam. The Sambourai Dam. Further proposals by Messrs. Watts and Hemsted. Liability of the Masai to provide funds. The Ngare Gisi Dam. Work in the Kedong Valley—The Wakiri Dam. The Poyela Dam. Mr. Hetzer and Merewart Dams. Contributions by the Masai. Damage to Dams at Lesuth and Ngare Gisi. Shortage of funds. The completion of the Ngare Gisi Dam. Repairs to Lesuth Dam. Mr. Watts' final report. Mr. Hemsted's proposals. Liability to repair damaged Dams. General recommendations. Shortage of storage on Wakiri River. Dams in the Rift Valley.

Towards the end of the year 1906, a tour of inspection was made by Mr. McClure, the Acting District Commissioner, Ngong, and Captain Hawkins, the Assistant District Commissioner, Naivasha, in the country lying west of the Southern Uaso Nyiro, more especially of the areas known as Uaso and the Loita Plains and Hills. This inspection was conducted with a view to ascertaining the potential value of the area as a place for European settlement. The opinion of these officers was that the land near Naivasha was, on the whole, unsuited to such settlement, because, although portions of the land could be converted into farms, the holdings would be so disconnected by reason of lack of permanent water, that proper supervision of the area would be impossible. The Commissioner, however, was not prepared apart so to preclude any possibility of allotting land on a systematic plan, but they suggested that it was admirably suited to a nomadic and pastoral tribe, such as the Masai.

Tour by Mr. McClure and Captain Hawkins.

A portion of the west bank of the Uaso Nyiro, and the Lesuth Valley, had already been allotted to Europeans, but some 2,000* square miles of land were left available for European or native settlement. Of this area, 1,000* square miles might be described as waterless, *i.e.*, without permanent water of any description. After a moderately rainy season there would be sufficient water for such a tribe as the Masai. The year 1906 had been unusually dry, but a fair amount of standing water was found in dry river beds.

Large numbers of Purko Masai had recently migrated from Ngatot to Uaso, the Rotimik and Moriju Plains, their numbers being estimated at 2,000 men, women, and children, with 20,000 head of cattle, and the grazing grounds in Uaso were said by the Masai to be exceptionally good. The value of the magnificent grazing in the Loita Plains was greatly reduced by the absence of springs or other permanent water, but this country had previously been occupied by three clans of Masai—the Loita, L'Oiayok, and Dorset.

These officers estimated that the area could easily provide dry and wet weather grazing for 100,000 head of cattle, provided the water difficulty was overcome, and reported that the ravages of fly were confined to the country near the Anglo-German border.

The country was next visited by Messrs. Beggs and Hollis, who toured, from the 10th of March until the 20th of April, 1907, the area lying between the Uaso Nyiro and the Mara River with a view to ascertaining the value of the region for occupation by the Masai then located in Laikipia, paying special attention to the water proposition. They reported that the two large rivers, the Uaso Nyiro and Mara, were 30 miles apart at their nearest points, that there were several minor rivers of no great length, and that water was obtainable by digging at various points. Some of the best water on the Uaso Nyiro was already in the occupation of white colonists, and a considerable portion on El Molo was also cracked off for alienation. Under the observed conditions, Mr. Beggs was unable to recommend the removal of the Northern Masai into the region, and he suggested the investigation of the potentialities of the Mara uplands.

Tour by Messrs. Beggs and Hollis.

* It is possible that these areas were over-estimated owing to the absence of any accurate survey.

German territory. Investigations were instituted by the District Commissioners of Tel and Mandi and these officers agreed that the stock taken on each side should be returned with the exception of a number of cattle belonging to the Wachaggas which were to be retained as blood money. Representations were made to the German Government who took steps to punish the raiders.

Delimitation of the Anglo-German boundary.

23. As a result of the affair described in Incident No. 22, the German Governor suggested, in May, 1914, that the Anglo-German boundary should be more clearly defined from the Usambara District to Lake Chala. The matter was discussed by Mr. Holdsey with Herr Lent, the Imperial German District Commissioner of Moshi, at Taveta in that month, and these two officers proceeded along the border visiting the salt-licks which had been the source of the dispute. An arrangement was reached whereby the Wasambo, a German tribe, would be permitted to use under supervision, a salt-lick situated half a mile within British territory, on one day in each month. It was also decided that the unsurveyed stretch of 45mm miles from Lake Chala to the source of the Bombo River should be defined by prominent marks.

Captain Kraatz, a German surveyor, visited Lake Jipanza towards the end of July and was there met by Mr. Holmwood. These officers decided that the best method of defining the boundary between beacons 14 and 30 would be by means of a trench and by the erection of additional beacons at prominent points. The German Government agreed to undertake the work between beacons 14 and 17, but the outbreak of war prevented the performance of this undertaking.

Lion [illegible] Mgwana [illegible]

24. On the night of the 13th of February, 1914, [illegible] and one native shepherd were seriously wounded, and another young native received a slight wound. This raid was at first thought to be the work of four lions. Mr. Smith, the Acting District Commissioner, Tanga, proceeded to investigate, in company with the Doctor, Sergeant and mounted without satisfactory result all the young men of the Kaputiei division who occupy the neighbouring district. Finally the Doctor imposed a fine of seventy head of cattle on this division which would be returned if the culprits were handed in. No further evidence was forthcoming, and as it could not be proved that this division was in any way concerned with the raid the cattle were returned to their owners in April, 1914.

Permission to Wagogo to [illegible] April, 1914.

[274]

25. In April, 1914, an application was received from farmers living near Gilgil that their boys and servants might be permitted to carry firearms. This request was based on the frequency of raids on their farms by the Masai and other tribes and they cited five instances in the previous three years in which cattle had been stolen and the thieves undetected. The Government was unable to accede to their request but an additional police post was established among the northern Gilgil farms.

Raid on a Masai [illegible] April, 1914.

[275]

26. Five Masai of the L'Oiyenk division living in the Kwamparuka Hills successfully raided a German farm near Moshi in April, 1914. They were fired on by the owner, having one dead, and were subsequently apprehended with their property.

Permission to kill [illegible] August, 1914.

27. In August, 1914, the Governor approved a recommendation made by the Officer-in-Charge that the Masai Wanderobo and other natives in the reserve who were accustomed to live by hunting, might be permitted to kill zebra, hartebeest and wildebeest, provided that no hunting took place within the Game Reserve. Conditions were imposed that the Wanderobo should not be allowed to sell the skins or trophies of any of these animals, and they were forbidden to kill any other more valuable species, particularly elephants.

Proposal to [illegible] August, 1914.

[276]

28. A tendency on the part of the Masai to drift southwards was noticed in August, 1914, and a detachment under Mr. Hodge was despatched in September to prevent the farm hands from Naivasha towards Kijabe with a view to causing all Masai found out of their reserve to be returned thereto.

Driving [illegible] to the Masai [illegible] 1914.

29. On the outbreak of hostilities a military camp was established at Kajiado on the Magadi Railway, and in order that they might not impede active operations the Masai were instructed to move all their cattle from the grazing grounds lying

Gwaso along the left bank of the Mole River up stream to the point where it is crossed by the Nakuru Eldoret Service Road; thence along the road in the direction of Eldoret Service to the point of commencement.

"The following area, however, is to be excluded from this native reserve, viz., 800 acres situated as follows:—

"Commencing at the point where the Mole River is crossed by the Nakuru Eldoret Service Road the boundary follows this road in the direction of Eldoret Service for about one and one-third miles; thence in an easterly direction for about half a mile; thence in a north-north-easterly direction to the Mole River, thence along the left bank of the Mole River up stream to the point of commencement.

The Uasin Gishu Reserve Proclamation, 1914.

On the 9th of April, 1914, Rules were introduced under the Native Passes Regulations, 1909, forbidding the Uasin Gishu Masai from proceeding out of the reserve set aside for the use of their tribe except under permit from a District Commissioner or Assistant District Commissioner.

Proposals for the removal of the Uasin Gishu Masai.

In August, 1914, proposals emanated from the Land Office recommending the removal of the Uasin Gishu Masai from the area reserved for them and throwing their reserve open to European settlement. The argument was that in the event of a railway passing through that part of the country, it would be a pity to allow this small and unpalatable tribe to occupy a tract of land so valuable from an agricultural point of view as the Mole River Reserve.

It was suggested that a place might be found for these people in the Southern Masai Reserve.

Action on these proposals was delayed by order of the Governor until various other important questions relating to native reserves had been settled.

The Uasin Gishu Masai in North Kavirondo District.

After the defeat of the Uasin Gishu Masai by the Lathigin Masai on the plateau during the latter half of the nineteenth century, members of the former tribe found their way into Kavirondo country and settled in the North Kavirondo area under the Nandi Government. From that area they were moved further to the west in 1902. In 1907 they were located in all parts of the North Kavirondo district, some of the bands being situated near the Uganda border. Periodically they asked to be allowed to take up separate and unoccupied grazing lands in the east of the district but these applications were opposed by the Provincial Commissioner, Mr. Ainsworth, who insisted that these Masai should remain mixed up with the Kavirondo.

When disbanment broke out in North Kavirondo District in 1911, the District Commissioner allowed these people to move east with their cattle so that the bands might escape the area of infection and they used the opportunity afforded by this privilege in order to make an effort to achieve their desire to be allowed to reside by themselves under Masai conditions. Personal enquiries moved into the Trans-Nzoia area.

The future policy in dealing with this section of the tribe was referred to the Governor for decision in March, 1912, and he directed that these Uasin Gishu Masai should be moved into the North Kavirondo District and placed under the control of responsible chiefs with a view to inducing them to mix with the neighbouring Kavirondo and to abandon their pastoral tendencies in favour of agricultural occupation.

Steps were taken during March and April, 1914, to move these Masai from the remote parts of the district and they were distributed in the various locations under the personal supervision of the chiefs concerned.

[p. 179 and [illegible]]

Appendix I.

Agreement, dated 10th August, 1904, between His Majesty's Commissioner for the East Africa Protectorate and the Chiefs of the Masai Tribe.

*649 166 We, the Undersigned, being the Lybon and Chiefs (representatives) of the existing class and sections of the Masai tribes in the East Africa Protectorate, having, this 9th day of August, 1904, met Sir Donald Stewart, His Majesty's Commissioner for the East Africa Protectorate and discussed fully the question of a land settlement scheme for the Masai, have, of our own free will, decided that it is for our best interests to remove our people, flocks, and herds into definite reservations away from the railway line, and away from any land that may be thrown open to European settlement.

We have, after having already discussed the matter with Mr. Hobley at Naivasha and Mr. Ainsworth at Nairobi, given this matter every consideration, and we recognize that the Government, in taking up this question, are taking into consideration our best interests.

Now we, being fully satisfied that the proposals for our removal to definite and final reserves are for the undoubted good of our race, have agreed as follows:—

[131] That the Elburgi, Gekunchi, Loita, Dumat, and Laitayok sections shall remove absolutely to Laikipia, and the boundaries of the Settlement shall be, approximately, as follows:—

On the north, by the Lerughi Mountains.

On the west, by the Laikipia (Nduare) Escarpment.

On the south, by the Lemerera or Nyuro and Guaso Narok Rivers.

On the east, by Kisima (approximate).

And by the removal of the foregoing sections to the reserve we undertake to vacate the whole of the Rift Valley, to be used by the Government for the purposes of European settlement. Further, that the Kaputei, Matapato, Ndoigobori, and Siguroi sections shall remove into the territory originally occupied by them to the south of Donyo Lemayu (Ngong), and the Kimarian stream, and to comprise within this area the Donyo Lemayu, Ndoigobori, and Matapato Mountains, and the Donyo Narok, and to extend to Sonian on the west.

In addition to the foregoing, Lenana, as Chief Lybon, and his successors, to be allowed to occupy the land lying in between the Mbagathi and Kimarian streams from Donyo Lemayu to the point where both streams meet, with the exception of land already occupied by Mr. Outhwaite, Mr. McQueen, and Mr. Paterson.

*648 In addition to the foregoing, we asked that a right of road to include certain access to water be granted to us to allow of our keeping up communications between the two reserved areas, and, further, that we be allowed to retain control of at least 5 square miles of land (at a point on the slopes of Kinangop to be pointed out by Legalishu and Mankonoli), whereat we can carry out our circumcision rites and ceremonies, in accordance with the custom of our ancestors.

We ask, as a most important point in this arrangement, that the Government will establish and maintain a station on Laikipia, and that officers whom we know and trust may be appointed to look after us there.

Also that the Government will pay reasonable compensation for any Masai cultivation at present existing near Nairobi.

In conclusion, we wish to state that we are quite satisfied with the foregoing arrangement, and we bind ourselves and our successors, as well as our people, to observe them.

APPENDIX 2.

AGREEMENT OF 1911.

AGREEMENT.

We, the undersigned, being the Paramount Chief of all the Masai and his regents and the representatives of that portion of the Masai tribe living in the Northern Masai Reserve, as defined in the agreement entered into with the late Sir Donald William Stewart, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, His Majesty's Commissioner for the East Africa Protectorate, on the ninth day of August One thousand nine hundred and four, and more particularly set out in the Proclamation of May thirtieth One thousand nine hundred and six and published in the "Official Gazette" of June first One thousand nine hundred and six, do hereby on our own behalf and on behalf of our people, whose representatives we are, being satisfied that it is to the best interest of their tribe that the Masai people should inhabit one area and should not be divided into two sections as most arise under the agreement aforesaid whereby there were reserved to the Masai tribe two separate and distinct areas of land, enter of our own free will into the following agreement with Sir Edward Percy Cranwill Girouard, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Member of the Distinguished Service Order, Governor and Commander in Chief of the East Africa Protectorate, hereinafter referred to as the Governor. 648*

We agree to vacate at such time as the Governor may direct the Northern Masai Reserve which we have hitherto inhabited and occupied and to remove by such routes as the Governor may notify to us our people, herds and flocks to such area on the south side of the Uganda Railway as the Governor may locate to us the said area being bounded approximately as follows and as shown on the attached map. 648* 166

On the south by the Anglo-German frontier;

On the west by the Ol-erukoi Range, by the Amala River, otherwise called Ang-aro-dalash or Eng-aro-o-'n-gipai, by the eastern and northern boundaries of the Sotik Native Reserve, and by a line drawn from the most northerly point of the northern boundary of the Sotik Native Reserve to the south-western boundary of the land set aside for Mr. E. Powys Cobb ep Mau;

On the north by the southern and eastern boundaries of the said land set aside for Mr. E. Powys Cobb, and by a straight line drawn from the north-eastern boundary of the said land to the highest point of Mount Nasera otherwise called Ol-doinyo Ongeko;

On the east by the Southern Masai Native Reserve as defined in the Proclamation dated June eighteenth One thousand nine hundred and six, and published in the "Official Gazette" of July first One thousand nine hundred and six.

Provided that nothing in this agreement contained shall be deemed to deprive the Masai tribe of the rights reserved to it under the agreement of August ninth one thousand nine hundred and four aforesaid to the land on the slopes of Kinangop whereon the circumcision rights and ceremonies may be held.

#648
166

In witness whereof and in confirmation of this agreement which has been fully explained to us we hereby set our marks against our names as under:—

Mark of Segi, son of Ol-onana (Lenana), Paramount Chief of all the Masai.

Mark of Ol-le-Gelenno (Legalishu), Regent during the minority of Segi, head of the Molelyan Clan, and chief spokesman (Ol-aigwenani) of the Il-Kitoip (Il-Meriabo) age-grade of the Purko Masai.

Mark of Nolaidota, Regent during the minority of Segi, of the Ainer Clan.

Mark of Ol-le-Yeli, head of the Mokesen Clan of the Purko Masai, and one of the spokesmen (Ol-aigwenani) of the Il-Kitoip (Il-Meriabo) age-grade of the Purko Masai.

Mark of Ol-le-Turere, head of the Mokesen Clan of the Purko Masai.

Mark of Olle-le-Malit, one of Masikondi's representatives, of the Lenghumar branch of the Ainer Clan of the Purko Masai.

Mark of Ol-le-Matipe, one of Masikondi's representatives, of the Lenghumar branch of the Ainer Clan of the Purko Masai.

Mark of Ol-le-Nakisla, head of the Tarosero Clan of the Purko Masai.

Mark of Ol-le-Nashisa, head of the Ainer Clan of the Purko Masai.

Mark of Marnabie, uncle and personal attendant of Segi.

Mark of Sanchi, the Prime Minister of the late Chief Ol-onana (Lenana) and principal elder of the Southern Masai Reserve.

Mark of Anali, uncle of Segi, representing the Loita Masai.

Mark of Ol-le-Tanyai of the Tarosero Clan, chief spokesman (Ol-aigwenani) of the Lemek (Moitaroni) age-grade of the Purko Masai.

The above set their marks to this agreement at Nairobi on the fourth day of April nineteen hundred and eleven.

A. C. Hollis,
Secretary, Native Affairs.

Ol-le Mashoshe, head of the Lenghumar section of the Ainer Clan; chief elder of the Purko Masai, called in the former treaty Ol Oiboni of the Purko Masai.

Ol-le-Bayiet, head of the Ainer Clan of the Purko Masai on Laikipia, Ol aigwenani of the age known as Il Meriabo.

The above set their marks to this agreement at Rumuruti on the 12th day of April nineteen hundred and eleven.

E. D. Brown,
Assistant District Commissioner, Laikipia.

Witnesses:
A. J. M. Cleaver
D.C. Laikipia.

His Mark: Ol-le-Lenguse, of the Ainer Clan Purko Masai.
His Mark: Ol-le-Gumbere, head of Tarosero Clan of Purko Masai.
His Mark: Ol-le-Salow, brother of Ol-le-Kotikosh, as a deputy for Ol-le-Kotikosh.

The above set their marks to this agreement at Rumuruti on 19th day of April, 1911.

E. D. Brown,
Assistant District Commissioner i/c Laikipia.

We the undersigned certify that we correctly interpreted this document to the Chief, Regents, and Representatives of the Masai who were present at the meeting at Rumuruti.

A. C. Hollis.
Ol-le-Tipea, of the Il-Ainer Clan.

We the undersigned certify that we correctly interpreted this document to the Representatives of the Masai at Rumuruti. 648* 166 ●

A. J. M. COLLYER,
District Commissioner.

OL-LE-TINKA. His Mark.

In consideration of the above I, Edouard Percy Cranwill Girouard, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Member of the Distinguished Service Order, Governor and Commander in Chief of the East Africa Protectorate, agree on behalf of His Majesty's Government but subject to the approval of His Majesty's Principal Secretary of State for the Colonies to reserve for the exclusive use of the Masai tribe the area on the south side of the Uganda Railway as defined above and as shown on the attached map, which area is coelunate with the Southern Masai Native Reserve and to further extend the existing Southern Masai Native Reserve by an addition of an area of approximately three thousand and one hundred square miles, such area as shown on the accompanying map the approximate boundaries being on the south the Anglo-German Frontier, on the west the eastern boundary of the aforesaid Southern Masai Reserve, on the north and east by the Uganda Railway zone from the Athi River to Sultan Hamud Railway Station thence in a line drawn from the said station to the north-west point of the Chiulu Range thence along the Chiulu Range to the south-eastern extremity thereof thence by a straight line to the meeting point of the Eng-are Rongai and the Tsavo Rivers thence by the Eng-are Rongai River to the Anglo-German frontier and to undertake on behalf of His Majesty's Government to endeavour to remove all European settlers from the said areas and not to lease or grant any land within the said areas (except such land as may be required for mining purposes or for any public purpose) without the sanction of the Paramount Chief and the representatives of the Masai tribe.

In witness whereof I have hereunto set my hand and official seal this twenty-sixth day of April One thousand nine hundred and eleven.

(L.S.)

Signed sealed and delivered by the within named Sir Edouard Percy Cranwill Girouard in the presence of
A. C. HOLLER.

E. P. C. GIROUARD.

We, the undersigned were present at a meeting between His Excellency the Governor and the Masai at Nairobi on the fourth day of April One thousand nine hundred and eleven, and we heard this document explained to the Chief and the representatives of the Masai who entered into this agreement of their own free will and with full knowledge of the contents thereof :—

R. M. COUPER,
Crown Advocate.
C. W. HOBLEY,
Provincial Commissioner, Ukamba.
JOHN AINSWORTH,
Provincial Commissioner, Nyanza.
C. R. W. LANE,
Provincial Commissioner, Naivasha.
R. L. HINDE,
Provincial Commissioner, Naivasha.
J. W. T. MCCLELLAN,
Provincial Commissioner, Kenya.
A. C. HOLLER,
Secretary for Native Affairs.
C. C. BOWRING,
Treasurer and M.L.C.

FL12 Masai FL12

The northerly or higher plateau region of Masai Land may be described as rising from an elevation of nearly 5000 feet on either side, and culminating in the centre at an elevation of little short of 9000 feet—although through this very line of highest elevation runs from the Dogilani plain the remarkable meridional trough which encloses the charming chain of isolated lakes, Naivasha, Elmeteita, Nakuro, and Baringo; and which, at the last-named place, begins to widen out till it assumes the characteristics of the southerly plain of Masai Land. 133

On the eastern half of this divided plateau rises, as we have seen, the snow-clad peak of Kenia—and the picturesque range of the Aberdare Mountains, which runs almost parallel with the central line of depression. A more charming region is probably not to be found in all Africa, probably not even in Abyssinia. Though lying at a general elevation of 6000 feet, it is not mountainous, but extends out in billowy, swelling reaches, and is characterized by everything that makes a pleasing landscape. Here are dense patches of flowering shrubs; there noble forests. Now you traverse a park-like country enlivened by groups of game; anon, great herds of cattle, or flocks of sheep and goats are seen wandering knee-deep in the splendid pasture. There is little in the aspect of the country to suggest the popular idea of the Tropics. The eye rests upon coniferous trees, forming pine-like woods, and you can gather sprigs of heath, sweet-scented clover, anemone, and other familiar forms. In vain you look for the graceful palm—ever present in the mental pictures of the untravelled traveller. The country is a very network of babbling brooks and streams—those of Lykipia forming the mysterious Guaso Nyiro; those of Kikuyu the Tana, which flows to the Indian Ocean through the Galla country; while further south in Kaptè the streams converge to form the Athi River, which flows through U-kambani to the Sabaki River.

Kikuyu occupies the higher areas of the eastern half of the plateau, cutting across it immediately south of the equator. Some of the higher parts are covered with a dense forest of bamboo; notably to the east of Naivasha, and between it and the Aberdare Mountains. Hence the Swahili name of one recruiting-place—Mianzi-ni (Bamboo Country). [137]

The greater part of Lykipia—and that the richer portion—is quite uninhabited, owing, in a great degree, to the 361 166

6: Thomson K-3 (1883-1884)1887
FL12 Masai FL12

361 decimation of the Masai of that part, through their intestine
166 wars—a fact that has caused them to retreat from the northerly districts, which are in dangerous proximity to the Wa-sûk.

131 The Masai country, so called, may be said to include the area lying between 1° N. lat., and 5° S. In breadth it is very irregular; but if we say that the average is ninety miles, we shall be pretty near the truth. In this, however, we are including several isolated areas occupied either by tribes wholly different from the Masai, or by the agricultural Wakwafi, who are mere off-shoots of the Masai.

132 The rainfall is very small over the greater part of this large area. Only an approximate guess, of course, can be given—but I think I am within the mark in placing the rainfall of the lower desert region at fifteen inches, and the higher plateau areas at from thirty to forty inches in the year. During the fourteen months in which I travelled in that region my caravan was not caught ten times on the march by rain,—a striking contrast to my experience in the region further south, where, for weeks together, rain was incessant. The rains are almost entirely confined to February, March, and April. The consequence of this insignificant rainfall is, as we have seen, that the lower plains are practically desert, though the soil is of the richest nature. There are absolutely no marshes, with their physical discomforts and poisonous exhalations breeding disease and death. The air is dry and invigorating, and though the days are hot yet the breezes blow with refreshing coolness, and a night of low temperature—and even frequently of intense cold—braces one up for the fatigues of the garish day. The contrast, indeed, is felt to be just a little too great, when you rise, shivering, in the morning, to see the grass covered with hoar frost, and then in the afternoon find yourself perspiring in the airiest of costumes, under a shady bush, with the temperature above 90° Fahr. The air, however, being so dry, I felt no inconvenience from these abrupt changes, and it was simply wonderful to see how the men would lie in the open air without a shred of clothing, and with the temperature at the freezing-point.

At the high altitudes of this plateau region, hailstorms of very great violence are of frequent occurrence, more particularly in the neighbourhood of the Aberdare Mountains. More than once caravans have been overtaken by them while on the march, and great numbers of the men killed by the

6:Thomson K-3 (1883-1884)1887
FL12 Masai FL12

628

disaster fell upon them shortly after, in a raid against their brethren of Kisongo. The saying that misfortunes never come singly was well exemplified by their case, for nature took up the work of ruin. A cloud of locusts settled on the land, and left not a blade of grass or other green thing, so that the cattle died in enormous numbers through starvation.

[142]
[291]
[301]

MASAI MARRIED WOMAN, NJIRI.

While the Wa-kwafi were in this unhappy plight, the Masai of the plains to the west fell upon them and smote them hip and thigh, and thus broke up and revenged themselves upon the most powerful division of the tribe. Great numbers having lost their cattle and been reduced to starvation, were compelled to throw in their fortunes with tribes they had hitherto despised. Some found an asylum in the forests of Taveta and Kahè, and the lower slopes of Mount Meru or

174
166

6: Thomson K-3 (1883-1884)1887
FL12 Masai FL12
Wa-Kwafi

174 Arusha-wa-jûû. Others, driven south, threw in their lot with the Wa-zeguha, keeping tribally more or less distinct
166 from them. These are the hybrid tribes visited lately by
[797] the energetic missionaries, Messrs. Last and Baxter, and of which such interesting accounts have been given in the "Proceedings of the Royal Geographical Society." Another section of the Wa-kwafi was driven westward, and now forms the colonies of Nderserria-ni and Nguruma-ni. The establishment of these colonies has been an unmitigated blessing to the country. In every case they have become the centres of trade, where men's lives and gooods are safe; and indeed there is no more striking feature in the results of the enforced change in the people's mode of life than the remarkable development of peaceable habits and honest ways. This shows what the Masai, from their distinctly higher mental development, are capable of, when cut away from their traditions and brought under conditions more favourable to their advancement towards civilization. As throwing light on the origin of minor races and the blending of two distinct types as at Taveta, the subject is an interesting study.

The Wa-kwafi were not all scattered thus, however, for a large division of the clan kept together, and contrived to cut their way through Kikuyu and to reach Lykipia, where they settled.

175 Another section crossed the meridional trough and reached
726 the opposite half of the plateau in Guas' Ngishu. In both
628 districts they found superb grazing-grounds and plenty of elbow-room, and there for a time they remained quietly, and increased rapidly in numbers. At last their wars began again. Grown bold, they attacked the Masai about fifteen years ago. The opposing parties formed regular camps, and fought pitched battles with great fury, thousands being killed on both sides. The women stood by and watched, while they incited and urged on the combatants in their terrible hand-to-hand encounters. The Masai were at first beaten, but, fighting with the stubbornness of despair, they disputed every foot of ground. They were driven from the whole of Naivasha and Kinangop, and their enemies, still victorious, carried the war into Kaptè. Matters now changed, however. The Masai of the entire region to the south gathered together and came to the assistance of their brethren of Kaptè. Soon the tables were turned, and the Wa-kwafi were gradually forced back. The great majority of them

7: Hailey G-4 (No date) 1950 FL12 Masai FL12

471 233 the Masai must, considering their small numbers, have a larger potential capital per head than any other tribe in East or Central Africa.

563 167 Practically the whole population may be said to belong to the Masai tribe, though there are a small number of immigrants, numbering rather less than one thousand in all, ninety per cent. being Kikuyu. As shown above, they are for the most part employed by the Masai in the cultivation of the small area of land used for agricultural purposes. There has been a certain amount of intermarriage, but the penetration of the country by the Kikuyu is viewed with distrust by the Masai, and three Alien Committees have lately been established in order to consider measures for the control of alien immigration. An area 631 167 of 47 square miles (known locally as Olenguruone) within the Masai Native Land Unit was set aside in 1942 for "squatters" displaced from European farms, most of whom are Kikuyu.[1] But this area will remain politically separate, and it will not affect the position of the Masai as a homogeneous population.

563 Early records refer to the existence in Masailand of a number of Dorobo, of whom Masai tradition speaks as the original inhabitants of the country. When Europeans first came into contact with the Masai, part of the Dorobo were still leading a primitive life in the bush, while part served the Masai as herdsmen and in some cases had small herds of their own. These people have, however, now been absorbed by the Masai and are not readily distinguishable from them.

THE MASAI TRIBE

131 648 Reference will be found in the Chapter on Tanganyika to the circumstances in which the Masai tribe, as it existed in 1890, was cut in two by the international boundary drawn between Kenya and Tanganyika.[2] The area thus left to the Masai in Kenya, now estimated at 15,177 square miles, compares with the area of 18,470 square miles now held by the Tanganyika Masai, with [161] an estimated population of 32,168, and a density of 1.7 per square mile. The proceedings as the result of which the Kenya Masai were in 1911 placed in occupation of their present area have had a prominent place in the controversies connected with the alienation of native lands in the Colony, but it will be sufficient to refer here to the facts as summarized in paragraphs 635 to 674 of 631 648 the Report of the Land Commission of 1933.[3] The Masai lands are now held as a Native Land Unit under the terms of the Native Lands Trust Ordinance 28 of 1938 and the Kenya (Native Areas) Order in Council 1939. There is, however, one fact which differentiates the Masai lands from those occupied by other tribes under the terms of this legislation, or those held by the Tanganyika Masai. Whatever the judicial value of the Agreements made with the Kenya Masai in 1904 and 1911, it is held, in the words used by the Governor of Kenya in 1946, that they "have the validity of a Treaty."[4] If so, the terms of the Order confirming the Agreement of 1911 constitute a moral obligation to the Government to reserve these lands for the exclusive use of the Masai, "so long

[1] Report on Native Affairs 1939–45, page 54. But see also the Agrarian Problem in Kenya, 1947, page 24 for more recent developments. Most of the Kikuyu are said to have abandoned their lands in the Settlement.

Kikuyu FL10
Masai FL12

seen amongst them, and it is not difficult with a little practice to tell the particular division to which a Kikuyu belongs. Thus the people of Iriaini* have pronounced Masai features, and many of their chiefs are pure or half Masai by birth. This is due to the fact that when the Kikuyu invaded that district about forty years ago they found it occupied by the remnants of the Alkipiak and Dala-le-kutuk Masai, who owing to famines, raids, and other causes were too much weakened to resist them. The two tribes therefore settled down peaceably side by side, and by intermarrying formed one people.

Again, many of the Kikuyu clans claim descent from certain particular tribes; thus, the Anjiro and Chakamoyo clans say they are descended from the Shuka, the Akkachiko and Achera from the Kamba, the Aesaka from the Chaga of Kilimanjaro. Anyone enquiring into the descent of those present at a meeting of Kikuyu elders will find an extraordinary number of different tribes represented. One is a Maeru, another a Chaga, a third a Masai, a fourth a Suuka, a fifth a Dorobo, and so on.

The actual Kikuyu themselves are said to have come from two tribes called the Shagishu and Ngembe, both of which still exist as tribes somewhere beyond the Maeru country, north of Mount Kenia.

I cannot speak from experience of the Shagishu, but I have met a native of Ngembe whose appearance reminded me strongly of a Kikuyu. This man, who said he had never seen a white man before, told me that his country lay beyond Maeru and that he had come here to visit relatives. These same Ngembe are believed to have been originally Dorobo, and Karuri, one of the paramount chiefs of the Kikuyu, who is himself a Dorobo, claims descent from them. The Ngembe of the present day are probably analogous to the Kikuyu, *i.e.*, they are a mixture of Dorobo and some other tribe or tribes.

Many absolutely foreign tribes have had colonies in Kikuyu for shorter or longer periods. A tribe of coast people called Digo are stated to have lived for many years on the Tana River, in what is now known as the Fort Hall District.† Somali, Galla, Boraana, or some other similar people effected a very strong footing in Kikuyu some fifty to seventy years ago. According to tradition they belonged to the Barabio Lokulala, Sigirai, and Eadarameroi dans,‡ and they had settlements at Nyeri, Naivasha, Kijabe, Punda Milia, and generally all over the Kikuyu country.

In those days the Alkipiak Masai occupied the Laikipia Plateau, the Purko Masai were at Naivasha, the Kaputiei in the Kidong Valley, and the Tarosero at Iriaini. The Dorobo, who were still the dominant tribe, occupied with the Kikuyu the present Kikuyu country.

With all these tribes the Somali or Galla lived in a state of chronic warfare.

The Laresea, a Kikuyu clan, and the Atwa, a Dorobo clan, unable to hold out any longer, migrated. The former have, it is said, preserved to this day their tribal identity and customs, and are still to be found somewhere in the vicinity of Kilimanjaro§; the latter near Mombasa.‖

The remaining tribes appealed for assistance against their oppressors to a great medicine man called Supi (or, to give him his correct name, Supeet), the grandfather of Lenana, the present Masai chief.

* The name Iriaini is said to be derived from 'E-Darosero ainei, my Tarosero women. Tarosero is the name of the most important clan in the particular section of the Masai.

† Mr. Hollis informs me that the Suguja, who have intermarried with the Digo, a sub-tribe of the Wa-Syiha, have a tradition to the effect that they once lived on the Tana River.

‡ Barabio is the Kikuyu, Sigirai the Iasai for Somali and Galla.

§ Possibly the Arusha, who live on Mount Meru in German East Africa.

‖ By Mombasa the up-country native often means the coast generally. According to Mr. Hollis the Wa-Swaya call themselves, and are known to the Galla as, Wawa; sing., Waaya.

*136 eastern, since Roosevelt and Heller collected some of the specimens here from which they described the difference between the two races.

At that time the link between the wildebeests in the Rift and those in the present Serengeti-Mara region may have been the Mosiro Plateau. In that area there is not the sheer wall that characterizes much of the western edge of the Rift, instead there are a series of steps and slopes which by themselves would not prove a
*13 barrier to wildebeest movement. Old Masai living on
[167] the Mosiro Plateau told us that they remembered seeing wildebeests on the Plateau when they first moved there (about 45 years earlier), and at that time the plateau country was open with tall grass, no gullies and no brush. Today the Mosiro area is one of the most severely overgrazed parts of East Africa, and is largely bare of grass, deeply eroded, and covered with thorn scrub (Talbot, 1960c). We regard it in its present condition as an effective barrier to movement of wildebeests.

*136 Roosevelt and Heller (op.cit.) also mapped wildebeests of the western race south in the west side of the Rift to Lake Natron. Today, however, the wildebeests at Lake Natron are the lighter colored, larger, eastern form. If Roosevelt and Heller were correct that

21:Huxley Q, T-5 (no date) 1960 FL11 Luo
Masai FL12

133 Mau is the source of all the rivers watering the western half
[137] of Masailand, Kipsigis and part of the Rift Valley. The birthplace of innumerable streams, it is, in theory, protected by its status as a forest reserve.

185 Looking out from the small yellow aircraft expertly handled
311 by June Wright, one of the best commercial pilots in East Africa, one could quickly see how different theory was from practice, here as elsewhere. In a forest reserve no one is allowed to fell trees, cultivate, start fires or graze livestock. In less than half an hour, I counted seventeen active fires and saw the shambles created by innumerable others. Whole ridgebacks of the mountain, sticking up like black spines, were as bare as slag-heaps and already runnelled and creased by gully erosion. Older fires were still smoking in some of these devastated areas; one could see the forest being eaten into like a great fur pelt attacked by moths.

As sure as fate, one day there will be no more water for cattle in the streams below. 'God is punishing us,' will say the Masai: but it will not be God, it will be themselves. The
[233] streams are already shrinking and the Masai are driving their herds farther into the hills to find grazing. They cannot take cattle into forest and so they burn a way in. They are creeping upwards, spreading destruction as they go in order to escape the consequences of destruction they have already caused.

[222] Other fires are started by honey-hunters who burn down trees to smoke out the bees. Often, in the forest, you can see blackened hollow cedars and olives killed by fires tucked into the roots. If the foliage is dry and the wind right, the fire will spread and get out of hand.

563 And then there are 'acceptees': a clumsy term given to men of other tribes who are settling in Masailand, family by family, with the permission of Masai elders. They are tenants: but it is very unlikely that they will ever go.

[167] In South Nyanza and in Kipsigis it is reckoned that upwards of two thousand families a year are crossing the southern border into Masailand and Tanganyika. In recent years a
[582] good many Masai have married Kikuyu or Kamba wives
[842] because so many of their own women are sterile; at one time there was quite a trade in Kikuyu girl-children, exchanged for cattle.

/5 cont./

II.

000 The East African steppes as habitation area of the Masai people. -- Their immigration in three corps. -- Their battles. -- Division and distribution of the land among Masai, Wakuafi, Wandorobo and their attitude toward one another. -- Influence of the Masai people on the sedentary tribes. -- Mixture with Negroes. -- The somatic characteristics of the three branches of the Masai people show their racial connections, the ethnographic ones their social connections.

131 Between the 34th and the 38th degree of longitude and the 3rd degree north and the 7th degree south latitude, in German and British East Africa, we find large steppes, which are often designated as the Masai steppes after their inhabitants. They are bounded by hilly lands that are mostly thinly populated, especially by sedentary Negro tribes, and are more or less well cultivated.
133 The terrain formation of the steppes is sometimes flat, sometimes undulating or rolling, sometimes hilly and, in this case, usually determined by volcanic activity. This stands out especially drastically on the Kenia /Mt. Kenya/, Kilimandscharo /Kilimanjaro/, Meru, and Ol Donjo l'Eng ai, on the latter of which, for example, on a narrowly circumscribed space /6/ between the steep slope of the Mutiek Plateau, the Gilef and Timbati mountains, hill follows hill and almost every one bears or conceals the ruin of a crater, a landscape such as we are familiar with from photographs of the moon.

13 The extent of the steppes, in connection with the existing
[182] amount of precipitation and water sites, made them a more than adequate region for a stock-raising nomadic people. The very saliferous soil produces excellent fodder grasses and provides salt licks in countless places.

• 17 As far back as the history, the memory and tradition of the
131 people of these regions extend, and certainly still many, many centuries longer, these steppes were, and are up to the present
174 day, the arena of the Masai people. On the migration, or, more accurately, slow push, they came from the north, out of the

/168 cont./

231 show to what lineage or sublineage the owner belongs; those on the
233 small livestock the owner chooses for himself. Probably every lineage
422 has several distinct marks. A glance at history will explain this.
[613] In the immigration of the Masai people, accomplished little by little,
• [17] each of the many bands originally formed a closed whole, which each lineage represented in it adopted a particular mark in order to make its property known. So it was natural that later on different ownership marks existed in connection with one and the same lineage, each according to the affiliation with this or that band. Besides this some that belong only to individual -- very wealthy and widely ramified -- families are also known, and then they are applied in place of the others, not together with them. The marks on the cattle are the same as those on the donkeys, although the latter bear the ear marks almost exclusively, only very rarely also those on the body. If a
[613] head of breeding cattle passes to an owner belonging to another lineage, it is usually given a new mark, and, to be sure, this one
233 then on the right side of the body. Besides the
531 ownership marks, cattle often have still other signs burned in as adornment, especially
[232] circles or a sentry-box type of design. A
[412] circle around the root of the tail and, on either side of it, one or two concentric rings on the hind legs are found especially
233 frequently among bulls. In addition to these
232 cut and brand scars, which are therefore supposed to serve in part for identification, in part for beautification purposes, there is also a third type, which arises from operations that are performed with a red-hot iron (Fig. 75) for the curing of swellings on joints and tendons. These lines, usually lattice-shaped, are also found among goats and sheep. On female calves the horn attachments are often cauterized, so that they can not butt later on. This operation further brings about, in the view of the Masai, an enlargement of the belly, desirable for leather production.

Fig. 75.

FL12 Masai FL12

claim to belong to them live elsewhere. Merker gives as the principal divisions three provinces, Kisongo, Loita, and Olbruggo. This is perhaps not according to Masai traditions, but is not incorrect as a practical description of the present distribution of the tribe. The Loita and Olbruggo, also known as Elburgon and Purko, are both subdivisions of the Naivasha district, of whom the former acquired importance by refusing to accept the present Laibon, Lenana, and following instead his brother Sendeyo. Besides these districts, there are four clans representing genealogical not territorial divisions: Aiser, Mengana, Mokesen, and Molelyan. The Aiser seem to enjoy a certain primacy. The medicine men all belong to this clan, which is specially connected with Mount Ngong (to the south of Kikuyu), also called Ol-doinyo loo-l-Aiser, the mountain of the Aiser.

According to the social system of the pastoral Masai the male sex is divided into boys, warriors, and elders. The first stage continues until circumcision, which may be performed any time between thirteen and seventeen, or sometimes in the case of poor people not till twenty. Those who are circumcised about the same time (see p. 161 for details) are said to belong to the same age, and are known collectively by a distinctive name, such as 'the White Swords' or 'the Invincibles.' After circumcision the warriors plait their hair, but, except for a small skin hanging over the shoulders, and their arms and ornaments (which are described by Mr. Hollis), go absolutely naked. They subsist entirely on meat, milk, and blood, and in particular may not smoke or touch intoxicants. They do not live with the married people, but in separate kraals with the immature unmarried girls, with whom they are allowed to cohabit freely. Tradition[1] (see p. 117) ascribes this practice to the fear that if girls were kept away from the society of their own warriors, they would let themselves be seduced by the enemy; but the remedy has been worse than the danger it was to avert. The direct physical evil is considerable, and is partly responsible for the diminishing numbers of the race. Besides this, female morality after such a girlhood was naturally low, even when the Masai kept to themselves. Now that they have come into contact with civilisation, prostitution and venereal disease have become deplorably frequent. About the age of twenty-seven or thirty, or nowadays when raiding is forbidden somewhat earlier, a warrior marries and settles down. If he

[1] It is said that among the Dinka, Bari, and Shilluk there are similar customs of free love.

1: Hollis G-5 (ca. 1894-1904) 1905
FL12 Masai FL12

The influence of the
791 medicine man is due to his supposed power of prophecy and
787 divination. No explanation is offered of this power, nor does it appear that the Laibons are believed to enjoy the acquaintance and assistance of definite spiritual beings; but they can foretell the future by such methods as throwing stones out of a horn, inspecting the entrails of slaughtered animals, interpreting dreams, and delivering oracles when intoxicated with honey wine. Great, however, as is their influence, it does not appear that either among the Masai or
•[171] the Nandi, where similar institutions prevail, they have ever attempted to assume a position like that of the various small sultans of the coast or the kings to the west of Lake Victoria.

791 The most celebrated of these medicine men was Mbatian, the father of the present holder of the office, Lenana, who died about 1890. He is celebrated for having prophesied outbreaks of cattle plague and small-pox, which duly came to pass; and also for having foretold the arrival of white people. It is generally said that he bade the Masai be friendly to them, but Mr. Hollis could not find any corroboration of this statement. His death was followed by
173 a disputed succession. There is considerable discrepancy as to
791 the details of the story, but, according to the versions taken
662 down by Mr. Hollis (p. 307), Mbatian told his eldest son Sendeyo that on the morrow he would invest him with the insignia of a Laibon, of which the principal is an iron club. Lenana, the younger son, overheard, and presented himself before his father very early the next morning. Mbatian, who was very aged and had only one eye, behaved much like Isaac in similar circumstances, and gave his younger son the insignia, saying 'Thou shalt be great among thy brethren and among all the people.' In any case, Lenana succeeded,
791 and was accepted as Laibon by all the Masai except the Loita.
578 This created a division in the tribe, and as it roughly
614 corresponded with the division between British and German territory, Sendeyo was long regarded as the chief of the German Masai and Lenana of the British. But in 1901 Sendeyo quarrelled with the German administration, made his peace with his brother, and came over to the British Protectorate.

796 The religious ideas of the Masai, as collected by Mr. Hollis, are vague and unformulated. The commonest word for God is Eng-ai, which it will be observed is a substantive with a *feminine* article. Eng-ai appears to be used either quite indefinitely and impersonally of remarkable natural phenomena

1: Hollis G-5 (ca. 1894-1904) 1905
FL12 Masai FL12

we have here primitive and undeveloped religious sentiment where the personality of the deity is hardly separated from striking natural phenomena, or remnants of some old cultus of the heavenly bodies, mountains, and tribal deities preserved in a hazy way by a military race which had not paid much attention to religion.

The Masai believes that ordinary persons die like cattle, and they throw away their corpses to be eaten by hyenas*, in the revoltingly unceremonious way common to many East African tribes. Medicine men, however, and influential people are buried, and their souls are said to pass into snakes, which are respected in consequence. Many tribes on the Nile also reverence snakes. It is noticeable that death and misfortune are not attributed to witchcraft. The Laibon is not the same as the Witch Doctor of the Bantu tribes, and it is no part of his duties to detect witches.

As the Masai men will practically do nothing but fight or tend cattle, they are naturally dependent on others for all articles, including their arms, which cannot be manufactured by women. There is among them a special tribe of smiths, called Il-Kuruma, who make iron weapons, but are treated as inferiors and not allowed to marry Masai women. A somewhat similar tribe are the Dorobo or hunters.

It would appear that the military organization, the aversion to hunting, to eating game or vegetable food, and to engaging in agriculture or any productive art are peculiarities specially developed by the Masai, though some of them have been imitated by other tribes. Another peculiarity is the shape of their houses—long low buildings constructed of poles, grass, and mud, and divided into rooms by partitions. Their other customs, however, seem to tally with those of the Latuka, Bari, and Dinka, as far as difference of environment and occupation permit. Remarkable points of agreement are the nudity of the men, the shaven heads of the women, extraction of the middle teeth of the lower jaw, resting in a standing position on one leg, drinking the blood from living animals, and spitting as a sign of affection or benediction.

Linguistic evidence points the same way, though ampler and clearer information about the languages of the Nile is desirable for purposes of comparison. It is no want of respect to the labours of Sir H. Johnston and others to say that the researches of Mr. Hollis have for the first time

* It has been suggested that this practice may be due to a desire not to contaminate the earth by burial, but Mr. Hollis could find no trace of this idea, although he carefully inquired.

Comets.

When the Masai see a comet, they know that a great trouble will befall them, the cattle will die, there will be a famine, and their people will join the enemies [2].

It is said that a comet was once seen before the Europeans arrived, and so some Masai children were watering the cattle at a pool after herding them, a creature resembling an ox but green in colour issued from the water. The children were frightened, and killed it. They then disembowelled it, and found that its body was full of curd-fat instead of blood. On returning to the kraal they related what had occurred.

When the medicine-man heard the story, he said: 'If we see another comet, people who are green in colour

[1] Lit. the star of the tail.
[2] The Dinkas have a similar tradition (Kronlein, Schilderungen, p. 140).

Cattle, grass, and milk.

The Masai love their cattle very much, and consider that nothing in the world is of equal value. As with people, each cow is known by name.

There is a saying which is as follows:

'One cow resembles a man's head.'

They mean by this that if a man

[1] *Vide* note 2, p. 312.

[136] [2] The Masai cattle are of the humped Zebu type.

[113] [3] Schweinfurth (*The Heart of Africa*, vol. i, p. 194) writes with regard to the Dinka and other Nilotic tribes: 'The poor savages . . . pay almost a divine homage to their cattle which they hold dearer than wife or child.' Kaufmann (*Schilderungen*, p. 101) adds that on the death of a cow a Dinka goes into mourning as he would if a relation had died.

[191]

Shaving.

Masai elders, women[1], and children shave their heads and eyebrows, and pull out their eyelashes if they enter their eyes.

They also pull out or shave the hairs of the beard, armpits, and pubes, and some singe the hairs of their skins.

If warriors are not in mourning[2], they may not shave their heads until they have held the feast called e-unoto[3], and they grow pigtails.

When a woman gives birth to a child, neither she nor the child are shaved until the latter has four

[113] [191] [194] Sir H. Johnston, in commenting upon this, says (*The Uganda Protectorate*, p. 805): 'It may be this explanation has been invented recently to explain a very ancient custom inherited by the Masai from the Hamitic stock, which was their origin; for amongst these people the removal of the lower incisor teeth is a very common practice.' Hinde's explanation, however, appears to be very widely spread.

[191] [1] This very uncommon practice for women to shave their heads is also followed by the Dinkas, Bari, and Latukas (Cummins, 'Sub-Tribes of the Bahr-el-Ghazal Dinkas,' *Journal of the Anthropological Institute*, 1904, 1905; and Baker, *The Albert Nyanza*, p. 90, &c.).

Spitting.

The Masai have two ways of spitting; one is used to show contempt, and the other astonishment. Besides this the medicine-men spit when they wish to heal people'. 301

If a Masai wishes to show his contempt for another man, he expectorates a small stream of saliva forcibly through the hole in his teeth into the man's face, and says at the same time: 'You are a dog.'

Ore pe ednl il-Maasai 'l-Ankumbe epe, ninikae, ntjo: 'Ekgu 'l-Orida* anaa 'l-inkuguni.' Nemeiyôu nenyikaki ainiye.

Formerly when the Masai saw Swahilis, they used to spit on the ground and say: 'These coast people stink like fowls.' They never went near them or touched them if they could help it. [177]

Ten ednl el-Maasai en-gurai kiti naita ne-ainig ednl, nenotaki 'ng-amulak, ntjo: 'Tainin, tamoo 'ng-enyuk e-'l-ereye.'

When a Masai sees a baby that he has never seen before, he spits on it slightly several times and says: 'Grow, become accustomed to the eyes of people.' 514 [184] [192]

Nae, ten ednl en-gurai naita ne-ainig ednl, nenotaki 'ng-amulak, ntjo: 'Tarume enne-kerai'; kake tjo ta-'l-tau laiye: 'Sidai enne-kerai'; ene ejj, ten ejiki el-tuligani en-gurai: 'Sidai enne-kerai,' nenwaiye.

When he sees a child that he has never before beheld, he also spits on it slightly, and says: 'This child is bad.' To himself, however, he says: 'This child is good.' It is believed that if he praises a child it will fall ill. [153]

* Amongst the Dinkas it is also customary for the medicine-men to spit on their patients (Kerbaeza, *Bahr-el-Ghazal*, p. 108). [171]

* The name by which the Swahili were formerly known.

1: Hollis G-5 (ca. 1894-1904) 1905
FL12 Masai FL12

514 576 201 Ten eŋgaaki 'n-gera kutiti 'l-tuŋgunak taati naleŋ, nenotaki 'ng-amulak il-taati, ntjiki: 'Mikitajape eng-Ai.'

If small children salute very old men[1], the latter spit on them, and say: 'May God give you long life and grey hairs like mine[2].'

Naa, ten eŋgaaki 'l-murran il-tuŋgunak kituak, nenotaki kulikae-kituak ing-amulak ing-aik.

Then, when warriors greet old men[1], the latter frequently spit in their hands before allowing the young men to grasp them.

821 514 789 Naa, ten edol el-Maasani en-ditki neitu ae-eleŋ edol, anaa el-akira ôltyo, nenotaa 'ng-amulak, ntjo: 'I'uaho! Imijire 'l-naŋgati!' ntjo ell: 'Telakwaki.'

If a Masai sees something phenomenal, such as a shooting star, he spits several times and says: 'Be lost! go in the direction of the enemy!' after which he says: 'Stay away from me.'

514 789 [551] [543] Ore ell ten eriktoo, neipot il-meretiga arukí eng-arua e-'l-tuŋgani ôtua, nenotaa 'ng-amulak. Ore ell ten eniŋ il-omon terok injere otua el-tuŋgani ôje, nenotaa 'ng-amulak, ntjo: 'I'uaho, eng-Ai, mikiata 'n-giyua.'

Again, should he forget, and call somebody who is dead, or mention the name of a deceased person, he spits. Should he hear any bad news, such as the death of some person, he spits, and says: 'Be lost, O God, we have no ears.'

514 199 Ore ɣ' eiter aapwtoo 'l-Aiengua kuuna-kwapi, pe edol il-Maasai, nenotaa 'ng-amulak, anaa ntjo: 'Eita kidol il-tuŋgunak anaa kulio.' Ntji ell: 'L-ilunuk kituak kulio-tuŋgunak.' Ore pe epik el-Aiengui el-tuŋgani el-ehani, ntjiki el-tuŋgani: 'Tonotakaki 'ng-amulak ɣ' aishio.' Ntji eng-arua 'l-Ojeja anaa eata 'l-papit kunuk.

When the Europeans came to these countries and the Masai saw them for the first time, they used to spit, for they said: 'We have never seen people like these.' They also called them medicine-men, and if a European gave a Masai medicine, the latter asked him to spit on him to heal him. Europeans were formerly called 'L-Ojeja owing to their being hairy.

[1] Vide p. 287.

[2] It is customary amongst the Bari people for old men (fathers or grandfathers) to take children's heads between their knees and spit slightly on them [illegible] (Wilkens-Meinhof, *Die Sprache der Bari*, p. 107).

Food.

Amongst the Masai the principal food of the old men, the women, and the children is milk. 262

The warriors alone drive bullocks into the forest, and slaughter them there: at other times they go to the married people's kraals and drink milk, but they never remain for two months together without slaughtering.

Whenever the old men, the women, and the boys are able to do so, they likewise eat meat. They also eat an ox if it dies a natural death [1], or if it is bitten by a snake, or if a beast of prey has killed it.

The Masai elders, however, do not slaughter their cattle without good cause, and a man who is very fond of meat is called a Dorobo. [186]

Whenever a woman gives birth to a child, a bullock is slaughtered, and she is given the fat. [846]

A pregnant woman is not given good food. When she wants meat, she is given bones or lean scraps; and when she wants milk, water is mixed with it. [843]

The Masai are also very fond of blood. They tie a leather ligature round the neck of a beast and pierce a vein with an arrow, the shaft of which has been blocked. When the blood gushes forth, they catch it [415]

[1] The Shilluk and other Nilotic tribes also eat cattle which have died a natural death (Seligman, Report on the Shilluks, p. 30, &c.). [171] [113]

Those of the warriors who like it also take snuff. The boys and girls, however, neither take snuff nor chew tobacco[2].

437 276 [249]

Metumil-Maasae ol-kumbau, amu meiytio aatuturu; kake einyañgu too-'l-meek, áinoeye eng-orno oo 'n-dare taaati.

The Masai do not grow tobacco themselves, for they do not know how to dig. They buy it from savages, exchanging it for butter and lean goats.

Memiraki 'l-Maasae 'l-meek in-giahu supati, 'n-giahu olupin ake oo nemeata kulle, oo náile 'l-aabo, ninje ake emiraki 'l-meek, oo 'n-dare mórunk oo 'n-daati.

The Masai do not sell good cattle to the savages; they only give them barren cows, or those which have no milk, or which do not care for their calves. These and old or lean goats and sheep are the only animals they part with.

273

Náok sii 'l-mórunk in-aishi, neinyañgu 'l-maruan o en-jui too-'l-meek.

The old men drink honey-wine, and they purchase from the savage two kinds of beer, called Ol-maru and En-jui.

262

'N-gera ake náince en-aishe najun. Ptiki en-ditki náince il-mórunk te-'n-aishe najun il-changaro aka.

It is only the children who like wild honey: old men eat the comb full of grubs[3].

[171]

[1] This custom is also common among the Bari (Kaufmann, *Schilderungen*, p. 170).

[2] In olden days it was the privilege of rich old men and their chief wives only to take tobacco, which was called ol-chani loo-'ng-ayok, the sweetness.

[3] The Masai obtain their honey by following the *Cuculus indicator* bird.'

The other Masai do not marry the daughters of the smiths, for it

564 191

[1] The Kunono and Dorobo seem to hold much the same position among the Masai as the Tumaloda (smiths) and Ramia (hunters) among the Somali. No free Somali enters a smithy, or shakes hands with a smith; none takes a wife from this stock, or gives his daughter to a member of it. The Tumaloda are spread over the whole of Somaliland as the Kunono over Masailand, and no instance is known of them giving up the trade. Still more debased and poorer are the Ramia, who, like the Dorobo, live by hunting game. Cp. Roland, *The History of Mankind*, vol. ii, p. 430.

The divisions of the day [1].

The Masai have various names for the divisions of day and night.

There is day (as compared to night) and evening.

The evening is the time when the cattle return to the kraals just before the sun sets (6 p.m.).

There is also the time called Nightfall, or the hour for gossip (8 p.m.); this is the hour before people go to bed.

Then there is the night, midnight, and the time when the buffaloes go to drink—this latter is the hour before the sun rises, which the Swahili call *Saa kumi* (4 a.m.).

There is also the time called The blood-red period *or* When the sun decorates the sky: this is the hour when the first rays of the sun redden the heavens (6 a.m.).

Then there is the morning; this is after the sun has risen.

There are also the hours called The sun stands *or* is opposite to one (midday), The shadows lower themselves (1–2 p.m.), and Afternoon.

[91] [1] The Dinka divide their day in much the same manner as the Masai (Kaufmann, *Dinkérwörter*, p. 130).

tact with a prophet is established before a raid. All these delegations are expected to pay the prophet a number of cattle contributed by the age-set's members they represent. The responsibility for collections of this kind is one of the main duties of the leaders.[179] 56 79

The authority and the influence of the prophet do not extend beyond these contacts. The elders alone are responsible for the organisation of the initiation ceremonies and hence for the institution of the age-class.

However, in his description of the *laibon* FOSBROOKE assumes too much. He writes,[180] " On evidence which need not be recorded here, it seems certain that the Masai, whose age grade custom so closely approaches that of the Galla, were possessed of their present military organisation prior to having their original home.[181] Thus it appears that the *laibon* is a later adaptation imposed on a self-sufficient organisation of government through age-grades. Probably much of the confusion of function which exists today, the indefinite division of governmental authority between the *laibon* and the age-set leaders, is due to the adoption of an institution (namely, the laibon hood, B. B.) incompatible with the original culture. It would be wrong to regard the institution as being foreign to Masai nature, but it is probably true that it is a feature which had not found its true level in the tribal structure when European influence intervened ". [171]

The assumption that the Masai age-system is related to the Galla age-system is frequently taken for granted but up to the present, nothing definite has been ascertained on this point.[182] On the basis of our present analysis we agree with FOSBROOKE's conclusion on the secondary character of the prophet's function in the institution of the age-class.[183] But we find it difficult to agree with him when he states that " the age grades " have been the channel through which the laibon institution came to be established as an [171] [114]

[179] It frequently happens, remarks FOSBROOKE, *l. c.*, p. 18, that the contributor does not know exactly the reason for his contribution. Of course he relies entirely on his leader.

231

perpetrated on other tribes. But the present conditions have altered this by the confinement of the boundaries of the reserve, and in addition to the deterioration caused by the lack of fresh blood and consequent in-breeding, the cattle suffer from want of pasturage and water in certain parts of the land that has been allotted to them. It is found generally that the quality of beef obtained from Masai cattle is very poor and is tending to become worse.

Pure-bred bulls

Owing to this deterioration, the Director of Agriculture suggested the immediate provision of a pure-bred bull for crossing with selected native cows. This experiment was tried, and the bull was sent to Narok, where it died in 1917, having left a few useful calves, but not having survived long enough to demonstrate the success of such an enterprise.

Mr. Hemsted suggested the establishment of a Government stock farm, to be maintained at the expense of the Masai, and intended solely for the benefit of the tribe. This would be of an experimental nature at first, but would be developed as circumstances required, and as funds permitted. The bull-bred stock produced on the farm, especially the bulls, would be sold to the Masai with the object of improving their herds. In conjunction with this farm a dairy industry might be started, and the Masai taught to manufacture ghee and dairy produce. This would tend to make the scheme self-supporting. As a commencement Mr. Hemsted asked sanction to purchase up to one hundred native cows or heifers and a few pure-bred bulls, and to establish a farm in the reserve by means of the funds derived from the Masai Suspense Account.

His proposal received the support of the Director of Agriculture, who thought that far-reaching results might thereby be obtained in the improvement of Masai cattle.

The scheme was discussed by the Governor-in-Council on the 14th of April, 1917, when a decision was given that the time was inopportune for the establishment of such a farm, and the further consideration of the matter was postponed until the conclusion of hostilities.

Sir Henry Belfield's minute on development of the Masai

Before proceeding on leave in April, 1917, Sir Henry Belfield recorded the following minute on the subject of the development of the Masai:—

"The proposal" (for the establishment of a stock-farm) "is based on the assumption that the policy of the future is to develop the Masai as pastoralists. If this assumption is correct, the proposal is sound. Personally, I would rather see the conversion of excessive herds gradually discouraged by taxation, and encouragement given to industrial habits. Further, I would prefer to see local and export markets provided by our Kikuyuan graduates rather than by the Masai. The proposal should stand over until the question of taxing of the Masai cattle has assumed a more definite form."

SECTION 4.—THE E-CHUTO CEREMONY.

Purpose of the ceremony—Description of the ceremony—Kinnapp—Application by the Masai for permanent residence on Kinnapp—E-Chuto ceremony in 1916—Negotiations for cession of rights to Kinnapp—Conditions sought by the Masai according to custom—Result of negotiations—Renewed application—Site in the Rift Valley—Completion of the ceremony—Discussion by Masai Council on surrender of Kinnapp.

OCC

561

The E-Chuto Ceremony, which bears large in the history of the Masai Moran, is a ceremony held according to Masai tradition at intervals of approximately seven years. The duration of the ceremony is from three to six months for each tribal division or group of divisions, and the duration for the whole tribe may, therefore, take from two to three years.

Purpose of the ceremony

The purpose of the ceremony is not too clear, but it is said to be for the handing over of the guarding of the Masai country to the incoming age of warriors, and it takes place a year or two before the circumcision commences. On the completion of these ceremonies, the past age of Moran ceases to take wives and go out as Elders. A similar ceremony used to be held by the Naish, but at the close of the expeditions of 1906 the Naish were induced to hand over the guarding of their country to the Government. In the case of the Masai the ceremony would appear to be both essential and inalienable.

● [ni]

9:Fosbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

These figures were obtained by reading through tax registers to groups of elders, who supplied the information. The number of wives showing in the registers were not revealed to them, and it was noted that in many cases the numbers given by the elders exceded those recorded in the books. 162 595 [26]

The percentages to be drawn from this table are of special interest when compared with another tribe. For this reason they are tabulated below, in conjunction with those of the Hehe, figures from Brown and Hutt's 'Anthropology in Action', page 107. 162 171 595

Marriage Statistics.

	MASAI	*HEHE*	
Unmarried men	42.2%	25.2%	) of adult
Men with one wife	33.1%	48.4%	) male
Men with two or more wives ...	22.7%	26.3%	) population.
Wives for every 100 married men ...	161	153	

Two points of interest arise from these figures. The first is the much larger proportion of unmarried men amongst the Masai. These fall mainly in the warrior class, as the following table shows :—

Marriage of Morans. 162 595

	Kibaya	*Samatuo*	*Engarenaut*	*Longido*	*Total*
Total morans	123	139	66	234	562
Total married morans	17	23	20	85	145
Percentage married	13.8%	14.5%	30.3%	36.3%	25.8%

The other interesting point is that one would expect both the percentage of polygamous marriages to total marriages, and the number of married women per 100 men to be much higher in the case of the Masai than the figures actually reveal. The reason for this lies in the number of dependent women not classified by the Masai as wives. The first table shows that for 900 adult males there are only 900 wives; but census figures show a preponderance of females over males, and the 900 males probably represent at least 1,200 adult females, the balance being made up by mothers (with husbands still alive) living with their moran sons, deceased brothers' wives with male issue, (not therefore taken to wife), etc.

In one area the distribution of the women (wives only) amongst the ages was worked out; it was found that there were approximately 2 wives to every Dwali, 1.5 to every Darete and 0.5 only to every Kisale.

Although it was found that on an average each gate pays only four taxes, the probability is that there are usually more than four huts to a gate, for those morans who pay tax but do not possess a hut are thought to be more than offset by those women who do possess a hut yet pay no tax. The number of cattle to each gate were examined in the Longido area, with the results shown in the table below :— 233 592

PREFACE.

114 In the past very little detailed work on the social life of the Masai has been attempted,
115 since such investigations cannot well be made through interpreters, while few, if any, Europeans speak the Masai language sufficiently fluently to make such an investigation in that language.

Although I cannot claim any knowledge of the language of the Masai, I have been
[120] fortunate enough to become friendly with four Masai who speak Kikuyu fluently, and as I speak Kikuyu as well as I do English I was able to learn something from them about their customs.

These notes are of necessity brief and full of lacunæ, since I avoided asking direct
[124] leading questions, though tempted to do so, and also because they do not include information unless it was obtained from or corroborated by more than one informant.

The Masai from whom this information was obtained came from that part
[101] of the Masai Reserve which lies to the west of the Mau Escarpment, and I was not able to find out whether these customs prevailed among the whole of the Masai group.

My two principal informants were an old woman, past child-bearing, and her married son, aged about 35 (I have unfortunately lost the paper with their names).
[128] They were insistent that most of these customs have been slightly modified since government control has been set up, but I have, notwithstanding, written mainly in the present tense.

PART I.—CHILDHOOD.

949 *Birth.*—Among the Masai, birth takes place in the woman's own hut in her husband's village and she is attended by an old woman of her husband's family. Other women may be present, but no men. If a woman is having her first child she assumes a stooping position supported by other women, as the first child is considered more difficult to deliver; otherwise a woman giving birth to a child lies upon the bed. The acting midwife cuts the cord with a special instrument,[1] and both the woman and new-born child are washed with warm water. The placenta is carried out and thrown down in the cattle yard, but is not buried. As soon as the child is born its navel is sanctioned in order that an animal may be bled to supply blood for the mother to drink. If the child is a boy the blood is obtained from a young bull, and if a girl, from a young heifer. (For method of procuring blood see Part IX.) From the day of
[944] birth onwards many sheep and goats are killed to supply meat and fat for the mother in order that the child may grow up strong, but these animals have no special significance, and are not sacrificial or for purification purposes.

553 *Naming Ceremony.*—Children are not named until they can run about, and unlike
[971] some other East African tribes, the child does not inherit any name from any PETRALIAN TELEGRAPH

[1] There is some mystery attaching to the instrument used, and I am not sure what it is.

11: Leakey K-5 (no date) 1930 FL.12 Masai FL.12
Kenya

56 place until the two senior groups move out together into the elders' class. The result of this arrangement is that no group which enters the warrior class as moranglonyo ever stays in the warrior class for as long as any *junjunoiber* group.

56 *Manyattas.*—During their time of service in the warrior class the members
62 of each age-group live in special villages built away from the main married men's
89 villages. These villages are territorial, in that all the warriors of a single age-group
56 in a single area live in one such village. Warriors of different age-groups never
834 live in a single manyatta, as each manyatta is essentially the headquarters of the members of a single age-group in the warrior class in a given area. *Manyattas* are moved about from place to place when fresh grazing is necessary.

62 A manyatta consists of a number of kraals each one of which is built, and lived
56 in, by the mother (or another married woman relative) of one of the warriors of that manyatta. Normally each warrior has his own mother living in the manyatta and she is accompanied by her children, especially by some of the man's uninitiated sisters and half-sisters. The older women are there to do the work of the manyatta,
845 such as milking, fuel gathering, water drawing, etc., and in this they are assisted to a certain extent by the girls, but the latter are chiefly in the manyattas as companions and lovers for the warriors. No girl can live at a manyatta at all unless her brother or half-brother is a member of that manyatta, and each warrior living at a manyatta is expected to bring two or three of his sisters or half-sisters to live at the manyatta, and if possible some of them should be fairly grown up and others quite children who will grow up at the manyatta.

836 *Sex Life.*—During the warrior stage no man may have sexual intercourse with
56 any initiated girl or with married women, but on the other hand, there exists in the manyattas a system of sex life which is decidedly interesting. The warriors, whenever they feel like it (which, as my informant pointed out, is "very, very often"), invite one of the girls (sisters of the other men in the *Manyatta*) to sleep with them.
601 This is done by a method and formula which corresponds in some ways to the
776 [illegible] of the Kikuyu peoples, but has certain marked differences.
777

A group of warriors at any time of the day will stand outside the village and call to any of the girls whom they see about, and when they come they say to them *nainkiro*, and the girls then each select one of the men, and say "I choose *no-and-no*," not mentioning the man by his own name but as "the son of *no-and-no*." By so doing the girl thinks herself to go out sleep with the man so chosen that night. It is a point of honour and etiquette that no girl so called upon to choose a man may refuse to do so unless she is (a) actually at a menstruation period at the time, or (b) has already promised herself to another man for that night, but she may make her choice from any of those men who were in the group that called to her.

11: Leakey K-5 (no date) 1930 FL.12 Masai FL.12
Kenya

[83] attached to the warriors to sleep with them. In fact, we may say that for the girls
[86] sex life starts before puberty and continues (with no such period of sexual prohibition as the boys have during the novice stage) until they are initiated. There is one important restriction, however, so far as the girls are concerned, and that is that
[84] sexual intercourse with married men is entirely prohibited before initiation, and is considered a very serious offence.

[41] *Menstruation.*—Menstruation is not looked upon as causing uncleanness, and there are no special rules and regulations attached to this condition, but, on the other hand, during the actual menstrual period a girl should refuse all invitations to sleep with men or boys. There is no restriction of work during the menstrual
[101] period as there is among some Bantu tribes, but a girl or woman must wash her hands before milking if she is menstruating.

[42] *Conception.*—There is a general belief (as already mentioned) that conception can only take place if there has been full sexual intercourse during the five or six days immediately following the menstrual period, and although there is no special teaching about this, girls grow up with this knowledge and take care not to allow full intercourse during the few days immediately following menstruation. Occasionally, of course, a girl does allow sexual intercourse at this time, either because she is carried away by sexual desire, or because she deliberately wishes to conceive for some reason or another (see Wanderkwel). In the former case she will try to bring about abortion.

[47] *Abortion.*—If a girl finds that she has conceived and wishes to induce abortion she sends for the man whom she considers responsible and tells him about it, and he is bound to help her.

As long as her condition has not been discovered by her parents she may try to induce abortion, but as soon as her condition is known to her parents she must no longer try to do so. Abortion is brought about by means of a stick of special wood which can only be obtained from a medicine man. This stick is inserted into the vaginal passage and is said to be an absolutely certain abortifacient. This is the only medical aid.

[87] *Penalty for Conception.*—If an uninitiated girl conceives and her condition becomes known she must immediately be initiated. In the normal way (see below)
[88] her initiation would take place at her mother's home and the necessary arrangements
[89] would be made by her father. But if she is uninitiated because she is with child the cost of all the arrangements is shifted on to the man who is responsible for the girl's condition, and the ceremony must take place at the man's village. This does not, however, mean that the man will have to marry her because of this, but he may do so should both parties desire it. He not only must the man arrange for her initiation and pay all the costs of the ceremony, but he must also give one heifer and a quantity of beer to the girl's father, because he has prevented the father

11: Leakey E-5 (no date) 1930 FL.12 Masai FL.12
Kenya

from having the honour of the feast of her initiation." Should the man decide to marry the girl, this heifer is counted as one of those which must be handed over for the marriage transaction (see Marriage).

Girls' Initiation.—Among the Masai girls are initiated singly and not in groups, nor are they initiated until a good many years after puberty, for as soon as a girl is initiated she must be married, and cease to have any intercourse with the warriors or boys. Except under the circumstances described above, a girl is not initiated until her breasts begin to droop to a marked extent. As soon as this is noticeable, her mother informs the father, who makes the necessary arrangements. If the girl's mother is living at the time at a *manyatta* with one of her sons, then the girl's initiation will take place at the *manyatta*, otherwise it will take place at the home village. The essential point is that initiation must take place in the mother's hut (or in the hut of another of her father's wives, should her own mother be dead). The father comes to the place when the day of the ceremony has been fixed and beer is prepared. A ram called *oldolejuthe* is slaughtered either before the actual operation or just after it. This is the "ram for childbearing," and is supposed to insure fertility. This ram is eaten by all those present at the ceremony. The actual operation is performed by an old woman, who is a skilled operator (she may be either a Masai or a Dorobo), and the girl sits on a skin inside the hut during the operation. The operation is said to be the same as that used by the Kikuyu on their girls, and this is a form of clitoridectomy, but exact details cannot be obtained from the men. As soon as the operation is over the operator washes the girl to "cleanse her of the blood spilt" and a ram is then slaughtered and given to the operator. This ram is called *olotapat*. Next a ram is killed called *olokiriatat* to provide meat and fat for the girl during convalescence.

Shaving Ceremony.—Finally after the girl is healed and before she can go to her husband's village, a ram is killed called *olkerret*, which is the "ram for the shaving," and at the same time the girl's head is shaved by her mother.

PART V.—MARRIAGE.

Exogamy.—Marriage is always exogamous as far as sub-clans are concerned, but marriage within the main clan is allowed. This rule not only applies to marriage but to all forms of sexual intercourse. No one, whether as a boy, warrior, or a married man, may at any time ever have sexual intercourse with any woman, girl or child of his own sub-clan. This is the strictest rule of all Masai sex regulations, and the penalty for any breach of this rule is very severe indeed (see below).

A woman remains a member of her own sub-clan even after marriage, but her children belong to the sub-clan of her husband.

Betrothal.—Amongst the Masai there are two usual methods of betrothal:—

(1) Betrothal of unborn children.
(2) Betrothal of infant girls.

13.Huntingford E-4 (no date) 1953 FL.12 Masai FL.12

of cattle to a family (*kishomi*) in 1908 was between 150 and 200 head. There appears to be no such system on the North Kaplti or Kipsiki *kimwanton*. (See above, p. 21.) Milking is done by girls and women into gourds; the calf is allowed to suck, and if it dies the skin, sometimes stuffed with grass and called *ol-dula*, is presented to the cow at each milking. The milk yield is about three pints a day. Cattle are bled in the same way as by the Nandi, with a blunted arrow, *ol-gorti*, shot into the jugular vein, and the blood is caught in a gourd. Sheep also are bled. Cattle are branded with marks on the rump or flank which indicate the owner's clan or sub-clan, with sometimes a private mark as well; the ears are also clipped for the same purpose. Salt for cattle is obtained by driving the horns to a salt-lick, *em-bolot*. The Masai are said to have effective remedies for diseases of cattle, but their efficacy has never been enough to prevent heavy loss during epidemics of rinderpest and pleuro-pneumonia.

Donkeys

The Masai keep large numbers of donkeys (*Gatchee*, sing. *e-ndirisi*) which are used for carrying their goods when they move home (*ilkar*). Donkeys are marked by slitting the ears in different ways.

The Status of Cattle

The status of cattle as regards ownership is uncertain. Merker says that women may own cattle; Thomson says they may not, and on such a point the statements of a traveller are open to question. Fadiman says that they may.* But further investigation of cattle as property, and of their status in the light of ritual value is required.

Inheritance of Cattle

There does not seem to be any clear account of the rules which control the division of a man's stock among his sons. The guiding principle is that the oldest son of the senior wife gets the largest share, inheriting not only the cattle given to trust to his mother, but also those which his father had kept for his own use. Inheritance is affected also by the "gate" (*kidowe*) arrangement in the kraal (the cattle may not pass from one side to the other. If a wife on the left side dies without sons, her cattle may not go to a man on the right side so long as there are any sons by other wives on the left side. This subject also needs further investigation.

Grazing and Water Rights

Land is not owned by individuals, but by the sub-tribe (*ol-oshe*), and grazing rights are acquired by residence. Water rights are controlled by the clan. In the old days, when the Masai occupied new territory, each warrior, according to tradition, claimed a well, spring, or water-hole on behalf of his clan. Individual rights over water are then ruled out by tradition, and the senior member of a clan living at the water decides, after consultation with other elements, the order in which people take their cattle to water. But a Masai when actually on the move with cattle may claim, and must be given, priority over local cattle at any well or spring. Where water is plentiful, however, as in a river, possession is unknown.

Division of Labour

In a purely pastoral society like that of the Masai the expression "economic unit" has little meaning, but so far as it can be said to exist, it is the family. It must be remembered, however, that the normal practice is for families to be divided between the father's kraal, *enkang*, and the warriors' kraal, *e-manyata*, and that the

* [illegible]

[illegible] (See details of the (Kidowe) arrangement in Huntingford, op. cit. p. 109. — Ed.)

13:Huntingford E-4 (no date) 1953 FL12 Masai FL11

If they are not already married. They have duties also towards the uninitiated boys as guardians and instructors, while the duties of the *il-ayiok* senior to them (see p. 115) are said to be responsible for the *il-ayiok* of the warriors. One hundred years ago Kingd wrote that the Masai had six age-divisions: "(1) Engaiu, little children. (2) Lorok, boys. (3) Elmoran or *ilkiduni*, from 17 to 30 or 35 years of age. These have not yet married wives, nor obtained cattle of their own. . . . (4) Elkiboi, who marry and have cattle of their own. (5) Elpakiki, older than the Elkiboi. (6) The Elkiyoni or Elkiaitiko, the aged persons."[1] A woman is classed as a girl (*nenk*, *en-kiyio*, *ulkiri*, *en-kiri*) till married, when she becomes a *e-nonkiki*, "young married woman," and then *en-kiok*, married women.

Kinship and Behaviour

The Masai kinship system seems superficially descent, and in this respect differs somewhat from the kinship systems of the Nandi peoples but the distinctly harmonic system is not taken into the third and second ascending generations. The Masai system is therefore different from the Nandi other, and though the word *enkiri*, meaning both "*pupil*" and "*relative*," occurs in the Masai system, it is not used with the generalizedness of the Nandi term *ilmi*. The Masai system has not yet been studied in detail, and the following analysis is based mainly on Hollis's account, the latest that we have.[2] Certain alterations and additions have been made after discussion with John Tompkins (an Masai) but there are considerable discrepancies between him and Hollis, and this analysis must be regarded as purely provisional.[3]

There are 11 terms used of both kindred and affines, together with two others used only of affines. The words *baba*, *papa*, and *papai* are used without gender signs; *baba* is derived from *ene-ababa*; *papa* and *papai* are the correct words for "father" and "mother" (not *mamai* and *papa*, which mean "father of" and "mother of"). *Aba* and *ba* derivatives take gender signs (*al-aba*, *e-le-ab-aba*, *en-e-ab-aba*, *al-ajabaai*, *nab-ajabaai*); *en-ko* also or *ebyoto* (*al-ebyo*, *nab-ebyo*); *ebyo* (*e-le-ebyo*, *en-e-ebyo*); *e-nabai* (only feminine); *al-ajabai*, *en-ko*, meaning son and daughter (both covered by *en-kiri*, "child," referring to either sex), and *al-abaiko*, brother, *nab-abaiko*, sister, which have to exhibit the normal change of *l*, *n* to *ll* indicating the feminine.

In the third ascending generation all males are *al-aba* and all females *baba*. In the second ascending generation, all males are *al-aba*, except the father's mother's brother, who is *al-ajo*. The wives of all *aba* are *baba*; but the wife of *al-ajo* is *papai*. The husbands of *baba* are: (1) of father's brother's sisters, *al-ajabai*; (2) of father's mother's sister, mother's father's sister, mother's mother's sister, *e-le-ebyo*.

In the first ascending generation, the father and his brothers are *baba*, the mother and her sisters *papai*, as well as father's sister. Mother's brother is *al-ajo*. Father's brother's and mother's brother's wives are *papai*; husband of father's sister is *al-ajabai*, of mother's sister, *e-le-ebyo*.

In a man's own generation, brother and father's brother's son are *al-abaiko*, and their wives *e-nabai*, brother's wife being distinguished as *e-nabai e-ayiok* to indicate closer relationship. Sister and father's brother's daughter are *nab-abaiko*, and their husbands *al-ajabai*. Father's sister's son is *al-ajo*, and his wife *papai*; mother's brother's son is *e-le-ebyo* and his wife *papai*. Father's sister's daughter is *en-e-ab-ajabai* and her husband *e-le-ebyo*, a term applied also to mother's sister's son and daughter (*nepo*, *ulkiri*, *kiri*, *nenk*), and to the husband of the mother's brother's daughter, who is *en-e-ab-ajabai*.

[1] Kingdon, op. cit. p. 18. In modern spelling the Masai words are as follows: *il-ayiok*, *il-aiyoni*, *il-kiduni*. The remaining words are names of age-sets. Hollis, op. cit. p. 280.

[2] Hollis, 1905, 281, pp. 279-80. This description Hollis's account is the Masai, op. cit. p. 1. There is no modern analysis of the Masai system by Kenyatta, Beech, Gulliver, Fosbrooke, of Fosbrooke and Sharrage, op. cit. p. 18.

[3] It is hard to understand Kenyatta, that the use of some words is not always uniform, as I have found among the Nandi; and this may sometimes account for apparent discrepancies.

[55] and these old men. If a man not previously received a name, it may have been
[55A] called by the name of his father's father, but at the coming ceremony it receives a
name which may be that of its father or a name not connected with any relative.
[55] People are also given nicknames referring to their physical or other peculiarities.
There is much uncertainty about Masai names; but every man has a patronymic,
consisting of *O-le,* "son of," preceding his father's name; this he appears to assume
after circumcision. Girls after circumcision may be referred to as *E-ne,* "daughter
of," preceding their fathers' names. At marriage, the husband gives his wife a new
name. The practice of teknonymy is a regular feature. Before the circumcision of
his eldest son, a man becomes known as "the father of" *Sa-ndim,* i.e., if his son is
called Sendim, he becomes Moyo Sendim; his wife similarly becomes Ejoo Sendim,
the mother of Sendim.

[55] The name of a dead child, woman, or warrior is not spoken again, and if the
[56] name is an ordinary word, that word is no longer used by the family. Thus, if a
man called Olomana, "the gentle one," died, as he didn't the word *mana* would
be replaced in his family by some such word as *pulpul,* "smooth."

Circumcision (3 months)

[59] Boys' circumcision ceremonies take place at intervals of about three years, and
[59A] the circumcision period is "open" for about four years. Though the operation may
be performed on boys singly or in small groups, the whole number of boys circum-
[59] cised at the same time throughout Mombasa forms an associating group correspond-
ing in some degree to the Dorobi *mat* (see pp. 31 and 46). Judging by the published
accounts, circumcision was a much less prolonged and ceremonious affair than among
the Dorobi. Before a boy can be circumcised, the father must submit to what is called
ee-ikitoto e-ntu, "the passing of the knife." After making honey-wine, he stays
alone in a small hut outside his kraal, dressed as a warrior. After four days, some
elders bring him back to his kraal, where he is told to remove the warrior's clothes
and become an old man. He was now free to be circumcised.

Circumcision begins with the shaving and bathing of the initiate in the
afternoon after the last boy (now an ox or sheep) is killed and eaten by the warriors
and elders of the neighbourhood. On the second day, the boy eats a raw calf or
[59A] this time *e-ntim,** which the girls of his kraal carry to the door of the hut (in which
the boy sleeps?), where it is placed. On the third morning the boy gets up early
and sits outside to get cold, after months he is circumcised, the operator being often
a Dorobo. From the fourth to the seventh day he remains at home, and then goes
out, dancing with blacked arrows at the girls, and with other arrows at small birds
[59B] which he wears hung from his head. This is his occupation till he has recovered.
[59C] During this time he is known as *e-ngatot* and wears the dress of a married woman,
including the *e-ntaria* necklace, and an ostrich feather on his head. After recovery
he is shaved, given weapons and warrior's clothes, and becomes *el-barneh,* "the
shaved one," i.e., a junior warrior. Till his local company forms its manyatta, he
lives at home.

Girls undergo the operation of clitoridectomy in preparation for marriage. There
are no special dates for this, but we are always in which before the operation. During
the period of recovery they are known as *e-ngatot,* and wear on their heads a wreath
of the Hypteae palm, *el-mirisiai,* or of grass, instead of an ostrich feather.

Age-set

[56] Unlike the cyclic age-sets of the Dorobi division, those of the Masai are of linear
type, that is, they do not work in recurring cycles and do not come into existence
till they are required. Nevertheless, it is clear from the lists of Krapf (1860), Dulfer
(1908), and Fuhlenbrock (1909), as well as from the Twenty age-sets (Dulfer, 1911),
that some at least of the names are first and recur. In 1908 the seven O-Kiaria

Political Structure

Local Divisions and Authorities

The basic unit of a tribe, *el-oshe*, is the *olé* or warrior company in its *manyata*, for it represents a district from which a given number of fighting men is drawn; and within this district are also the kraals, *enk-ang*, of the elders. The formation of an *enk-ang* varies. It may contain a group of men who continue as elders the association which they began as warriors in the *manyata*; or it may be a casual grouping which can break up and re-group; and it may contain anything from one to 10 gates. Within the *enk-ang* a rudimentary council exists to exist with one of the elders at its head. It may be no more than the heads of families sitting together and talking. Such as it is, it corresponds to some extent to the Nandi *kokwet*, though its powers and spheres are similar. But it differs also in an important respect. All the inhabitants of a Nandi parish, including the warriors, come under the jurisdiction of the *kokwet*, whereas in the Masai system the local warrior company has its own authority, the *el-aiyanani*, who is responsible for the maintenance of both military discipline and "civil law" within his company, and his warriors appear to be independent of the elders' council. When the *aiyanani* has passed out of the warrior stage, the *el-aiyanani* remains in authority. A number of *enk-kindis* form the larger unit, *el-oshe*, which English writers call the section or division, the latter being the word used by Sandford. Each of these *il-oshos* has a council of elders which corresponds in some respects to the Nandi *kokwet* council, and, as will be seen from p. 11 above, the *il-oshos* are associated either in loose confederacies with a group-name, like Il-Purko, Il-Dumat, and Il-Kob-o-rookie, which together form the Il-Kisonjo, or in district "tribes" like Il-Ikiputuk, Sambur. The organization of the Sambur seems to have developed on slightly different lines from the rest of the Masai.** The *enk-ang* is the homestead of one elder and his wives and children; a number of such homesteads form a local group with a council of elders, and the total number of local groups is divided among eight sections called *il-manyata* (sing. *el-manyat*), each with a council made up of the leaders of the component group-councils. These *il-manyata* are divided into two large sections with "cattle-names": the Il-oo-nok-kidin, "the black cattle," contains the *il-manyata* of Lo-l-pusio-kidin, Lo-l-gurei, Il-matia, and Ilpuyuni; and the Il-oo-ilar-kidin, "the white cattle," contains the sections called Il-oo-rok-kidin, Lo-l-kumai, Lo-l-mank, and Lo-gili.

The most important figure in Masai organization is the *el-aiyanani*, whose duties in the past were to make the practical arrangements for war, to control the distribution of the loot, to settle disputes when appealed to, to lead his men in war, and to maintain liaison between his company and the Indian on the one hand, and between his company and other companies on the other. But he could resign if displeased with his men, who in turn could dismiss him if not satisfied with his actions. Now that there is no more organized warfare, the duties of the *el-aiyanani* are mainly confined to the suppression of raiding, in which his effectiveness depends on his character, influence, and disposition; and to settling disputes, in which he is assisted by the elders of the district. Thus a council system with an elected leader has developed out of the older structure in which the *e-manyata* and *enk-ang* were semi-independent bodies. As among the Nandi, it is the personality of the *el-aiyanani* and the force of public opinion that compel obedience to him. But the whole Masai system is less clear-cut than even that of the Nandi, in spite of the apparent definiteness of the *el-aiyanani*, though in certain respects he is analogous to the Alin Boko or age-set ruler of the Galla, who is the tribal ruler for a period of eight years.

The Laibon

The laibon, a word anglicized from *el-oibon*, pl. *il-oibonok*, and derived from *a-oibon*, "to make 'medicine,'" is a ritual expert who practises divination and rain-making, casts charms, provides charms, and foretells the future. Fadiman divides

** Information from the Rev. Charles Sabwanani of the R.C.M.S.

Warriors do their hair in pigtails, *ol-taika*; other people of both sexes shave their heads periodically. In both sexes the ear-lobes are pierced and elongated, and the two lower middle incisor teeth are removed. Cicatrised patterns are often made on the upper part of the body in both sexes.

Iron-work

Iron is used for weapons (spear and sword of warriors, and arrows of elders), axes, knife-blades, razors, and many of the ornaments of both sexes. The spears and swords are distinctive of Masai culture and, together with the shield and *e-rup* arm-clamp, separate the Masai and Nandi culturally from other Nilo-Hamites. Spears are of three shapes: a small leaf-shaped blade with long neck, long shaft, and medium butt; the great "shovel-blade" with short neck, long shaft, and medium butt; and the long-bladed winged spear with short shaft and long butt. The colour of the short shaft of the winged war-spear is important: senior warriors have black shafts, others reddish ones, and the demand of junior warriors for the privilege of black shafts is a significant factor in the tension that arises between senior and junior warriors. The sword has a long narrow blade and is kept in a red leather sheath attached to the belt. The winged spear-blade and sword have been borrowed by the Nandi, Kipsikis, Kryo, Kony and others of the Nandi division, together with the arm-clamp; the Kikuyu have imitated them.

Other Objects

Clubs are made of wood or rhinoceros horn. Shields are roughly oval, about 3 ft. long, and made of buffalo or giraffe hide on a light wooden framework; according to Merker, the old form of shield was circular and (if the scale of his Fig. 245 is correct) about 1 ft. in diameter. Stools are cut out of a solid block of wood and have three legs. Horns are used for summoning people, but there are no musical instruments or drums.

Ritual and Beliefs

Religion

Little has been recorded of Masai religious beliefs, except such obvious facts as the invocation of *Enk-ai* (the Masai word for God, rain, and sky). As to ancestor-worship, it is generally said that the Masai do not believe in an after-life (said also of the Suk); but the alleged belief that the soul of a laibon or rich man turns into a snake implies some belief in the survival of the soul. This matter needs careful investigation; and Merker's statement that each Masai is taken to paradise by his guardian angel and let in by *Enk-ai* if he has been good is alien to Nilo-Hamitic thought. *Enk-ai* is recognized as a creator, and is prayed to by both men and women. Some of the prayers recorded include an invocation to both *Enk-ai* and Mbatiany, the laibon who died *c.* 1880; thus Thomson heard the Il-Aikipiak praying to *Enk-ai* and Mbatiany, and the Nandi war dance after a victory, recorded by Hollis after Mbatiany's death, contained also an invocation to *Enk-ai* and Mbatiany. The "minor deity called Neiterkob" which Thomson thought was an earth-spirit, appears in Krapf's book as the Neiterukob, "the mediator between God and men." But the Masai word *naiterukop* means no more than "that which began the earth," and thus would seem really to apply to *Enk-ai* in his role as creator. *Enk-ai*, god, is grammatically feminine, and his wife *Ol-apa*, the moon, is grammatically masculine.

Death and Burial

The bodies of most people are put out for the hyenas, to the west of the kraal, and laid on the left side so that the face looks eastward, with the legs drawn up, the head supported by the left hand, and the right hand across the breast. The

[P 195]

561
989

or kilo, myth, and the place was somewhere between Uasi Kedong and Sawa, i.e. west of the Kedong River in the Rift valley below the Kikuyu escarpment in Kenya. The gathering site for the warriors was deep in the bush about two hours march from the manyatta outside of which the O-mugwo hut was located. Everyone in the party, in addition to myself, were Charles Sheyo, Jack Cooldery and Jeremy D. Lenn. Sheyo was naked, heads shaved and embossed with white, carrying sticks instead of spears, we seated in a large circle. The forehead of each warrior was rubbed with the heart of the slaughtered animal and then the warrior took a bite of it. Following this, a strip of hide, about four or five inches long and one-half or one inch wide, pierced at one end by a one-inch rib, was placed over the middle finger of the right hand of each informant.

The magical significance of the heart and finger strip is not accurately known. Nothing magical is ever very clear! The heart probably signifies life and blood, and the binding of the warrior to cattle, the life-giver of the Masai. The significance of the hide strip is even more obscure, perhaps merely a symbol of brotherhood and of the association with cattle (see possibility of sexual connotation (finger symbolizing male genitals, rib in skin female)). If the latter, the individual Masai would certainly not be aware of this meaning, which would have originated long ago in an individual unaware, acted and have been observed for all others over the years. Finger strips and rings, and wristlets, are commonly (though not always) used as symbols of sexual union in East African tribes, e.g. the Wakamba use a finger ring from the heredity hide of a goat as an amulet against male sexual impotence (Mangaia, personal observation) and prior to marital sex consummation the Nandi groom wears a geneticic ring on his right middle finger and the bride a strip around her left wrist (Huntingford, 1955, p. 48).

[P 11]

After this day-long ritual the informants returned home or night to the manyatta, where further ceremony was carried out at the O-mugwo hut.

Foreword

by Professor Dr. Fritz Hommel, Munich.

The reports of the deceased Hauptmann /Captain/ Weiber, covering a sensation in his time, about the legends of the Ibeui as remarkably connected with the Hebrew early history are even today still capable of arousing the most widespread interest. The question as to whether traditions preserved for millennia from the Aryan original homeland of the Ibeui people actually exist here or whether a Christian or even Jewish influence is not still to be assumed has not yet been silenced. As is known, Weiber himself was undoubtedly convinced of the absolute impossibility of the latter assumption, and even if such an influence had nevertheless taken place, which is highly improbable in view of the reasons cited by me below, it could only have happened in the early period when the Ibeui were still living in the north, in the neighborhood of Abyssinia, which, however, also serves again as the basis for strong scepticism.

First of all, mystification on the part of Weiber, whose reliability is beyond all doubt, is completely excluded. Actually, it was only after a long acquaintance with the Ibeui of his region that he gained the confidence of these old Ibeui men who finally imparted to him the traditions otherwise anxiously kept from strangers; the distinguished Ibeui expert, our Berlinian compatriot Jung, and furthermore African experts such as Schillings and Dr. Gessler, are equally firmly convinced that Christian influence through the missionaries working there for only a comparatively short time, several whose efforts the vestige and proud Ibeui have been very successful up to now, is quite inconceivable. If the English missionary Albert E. Doggett, who was active there 1899-1905, says in the Sunday Times, 2'03, Jan. 1908, p. 408, that Mr. A. C. Wells, his ancient authority on the Ibeui living in British East Africa, related to him from a Ibeui boy in his service, "that the Ibeui from whom Captain Weiber got much of his information was for some years, during the Ibeui famine, connected with a Roman Catholic station in the neighborhood, as indeed were many others, besides those who came under instruction

According to Bellie, p.278, /xvi cont./ the Pleiades are only six stars among the Mosel. Likewise in the pictorial representations of South Arabian tomb inscriptions (in contrast to the seven circles of the Babylonian Sengal symbol): the name of the heaven of the religious tradition of the Mosel, al-bilsana, coincides strikingly with the expression for priest, kahin, in the old Minaean inscriptions of Tamna (?).

[xvii] 1. Quite remarkable also is the correspondence of the Mosel custom that when one is inside with her he places his spear in front of the hut so that another will not enter (Merker, p. 110 and p. 158) with the similar custom among the northern Arabs (here only staff instead of spear) given by Strabo (Book 16). -- Also that the "speaker" stands at the head of the warriors is reminiscent of South Arabia (cf. kail, chief, actually speaker, as well as mikal, "tongue," probably has the same etymology, cf. Syriac mekla, speech).

[xviii] The specifically Ethiopian word dengel, "virgin" (originally probably "young woman" in general), is the same as the Mosel ma-ingin, "young woman" (after the circumcision): tenge, al-gamaat, in the Arabic al-ballihan, and cowbell, ang-ganga, the Arabic al-galgal, an-ahem, spear, perhaps the Arabic al-ihs, needle. The name of the Dana species mugangara, from which the Mosel take a fragrant wood for therapeutic purposes (Merker, p. 37 and cf. p. 198, al-magnigiliani, a vanilla-scented perfume), is very reminiscent of the South Arabian name for frankincense, ruga. Just as in general the reduction of the second half of a word, popular among the Mosel (for example, gadarim, a /xvii/ tree name, sindarat, a dirdir), is likewise in vogue a peculiarity of Ethiopian, where it is used especially for the formation of color names (wanjiff, gold-green ; Hebrew jeraqrak, hanaiaff, green, for also hilwiff, hawkbite ; hill, and the Tigre plant names gendarim, endufiel, ambelfam, and hambagiagi). All these no doubt have made Merker's coming of the Mosel as originally Semitic and then, more specifically, an Arabian people seem fully justified.

[xix]

/will come./

171 173 To come now to the early histories. It is to be emphasized at the outset that, for any Semitic people, every time we come to the early period, through linguistic comparison, research into names, and literary remains, we are already able to uncover a well-established mass of myths that come very close to the Biblical early history (dragon fight in connection with the creation of the world, tree of paradise and serpent, first parents, flood) and furthermore, as religion, a pseudo cult (worship of the dead) to be described almost as heathenism. But we come across exactly the same

[135] thing, in its most original form, among our cattle nomads, the Hamal, whereby it should further be noted that also among the oldest Semites, whom we have to think of more as nomads than as agriculturists, cattle, as their mythology clearly teaches, must have played a great role, not perhaps the small livestock or the camel and the donkey, to say nothing of the horse, which only became known from Elam to the Semites here around 2000 B.C.

174 171 173 172 There is also the fact that among the Hamal we find a series of positively ancient traits that bring us close to the first Arabian original homeland of all West Semites, and which otherwise come to us most clearly only in the religion of the ancient Chaldeans (and then transformed into the more polytheistically steeped one of the Babylonians). To these belong first of all the struggle of the deity with the dragon Hamasis on the meaning of creation; often Hamar compares the word for dragon, ay-dimmat (Ass.), with the Babylonian tiâmat (some popular pronunciation somewhat like tiamat). It is certainly not merely an accidental homophony, since the word for paradise, Jarin, also goes back to the Babylonian iârû, "garden," which in the Hammurabi period must still have sounded like the unconserved iâru (cf. similarly Babil Babu, or that class will Babilu, and many other examples) (1).

1. When in Hamal ay-dimmat also means fetus, embryo, Arabic again offers a striking analogy here: cf. Arabic al-ghim (from al-ghâim), "dream," but al-ghâlb, "embryo."

/vol.num./

1974

973

Now in ancient Chaldean mythology this original dragon is the female lion-headed dragon with a long neck localized on the later picture of the crab and which, on the cylindrical seals, looks like a lion's or dragon's head sitting on a pole (her husband is the so-called vulture-dragon, the Kings of the Babylonian Epic of Creation); according to Hallo (p. 360), however, *mesanip* means "the one /lion./ on the pole" and she was originally a lion (or half lion, half human being with which one /vol.num./ should compare the Chaldean counterpart of the twins, the lion-headed centaur that has a lion's and a human head). Furthermore, the name of the morning star, Nilugan, which is precisely the Babylonian *girgilu* "lion," belongs here; cf. the name of Venus, Nin-dar-anna, mistress of the lion of heaven (also *anunitum*, corresponding to the nature of the morning star as contrasted to that of the evening star, Nin-darg of Gudea), which, as Gudea-Gir-gi-lu, already occurs in old Sumerian hymns (C. T. XV, 15, cf. Reisner, Hymnen /Hymns/, p. 138, lines 156 ff.). The second number of Ishtar (South Arabian *anunitum Astarti*), fifteen, also plays a role in connection with blood tortes: among the previously neighboring el-Gergawi people (cf. the Fikyanian Gergawi) for the birth of a boy the mother had to remain in the hut 30 days, for that of a girl, about 15 (30 is moon-number, cf. Babyl. Sin 30, his daughter Ishtar 15), Meiner, p. 302, where the 15 *good* barley with which the young man sole the father of the girl for her are also to be noted. If the three-headed serpent of paradise was called el-*ammunu* because it lived in the reeds (o el-*ammu*), it is also tempting to think here of a specific Babylonian word, namely, *ammu*, reed, *ammu* (or the latter, indeed, the reeds grew).

With regard to the individuality of the blood legends, it is entirely original and, in spite of all the connections with the Biblical early history, a wholly independent impulse from the same source. This is expressed above all in the fact that for the most part quite different names occur: thus, Mutsamba corresponds to Adam (perhaps from a collateral form of Adam, *ma'dhem* or *mattdhem*?), Tawhiamat to Noah, Gehenna, Sortiyam, and

/wild man./

1971
1973

Semite to his three sons, Sem, Ham, and Japhet, Herakl, or his double Hermes, to Hermes (cf. Hermes and Eos ; Hermes and Aurora), Isaac to Ishmael, etc. What has not yet been noted, however, is the quite similar prediction for popular etymological explanations, which are given for every blood name of this early history. If one compares the respective Hebraic explanations for the names Eve /Eve/ (Gen. 3, 20), Kain /Cain/ (4, 1), Seth (4, 25), Noah (5, 29), Abraham (17, 5), Isaak /Isaac/ (21, 6), Jakob /Jacob/ (25, 26), Esheu /Esheu/ (25, 25), etc., etc., up to Mose /Moses/ (Ex. 2, 10) and Israel (2. Sam. 1, 10) with the same interpretations of the Maori myths, likewise often far-fetched, for example, Hakumapik (a Eve) called her second son Kaine because he had moved (ake) violently in the womb, or Hakuwiko gave birth to a son and called him Sawa because she so daughtered by the father after the birth was spurned (sawa), then with this fashion prevailing the one side and the other to explain to some fashion all the ancient traditional names, one must exclaim in astonishment with Adam: This is now bone of my bone and flesh of my flesh (that is, parallel organic further development of a common tendency of early times, namely, the same natural disposition). The objection of despite that mimmersion (whether of more ancient times, say, of the five Christian centuries, or more recent ones is immaterial) told the blood lines stories in the Biblical style (and together with these Biblical etymologies) and the latter then changed them in accordance with their understanding and mental life, that is, /sic/ assimilated them completely into their own national experiences, and, to be sure, also freely copied the interpretation of the names, completely alien for here: it would be almost a greater miracle than the simple conception offered by Meder that the blood brought all these traditions from their Arabian original homeland, and that they (these ancient evidence) run parallel with the Hebraic ones and both are based on a Chaldean or Ant Arabian original

/via ness/
that has been lost to us (?).

1. With regard to the references to these Biblical popular etymologies cited above only with numbers, at least an example should be given for those who do not happen to have an Old Testament reality at hand. Genesis 25, 25 says "the first of the twins that came out of the womb was red (admôni, play on the word Edom) and was (rough) like a hairy garment (se'ar) and they named him (Esawhim) Esau (Ysaw), whose the accord between se' in se'ar and Ys in Ysaw is sufficient evidencely after that came out his brother, whose hand took hold of Esau's heel ('qeb), and they therefore named him Ya'qob." Actually, however, Jakob /Jacob/ goes back to a more complete form Jakob-el (in which God is the subject, therefore roughly: Esau follows on the heel God, that is, he rewards or punishes).

Indeed, in any case the matter is and remains amazing enough even so, but the imaginive connection of the will to revenge Esau, disposed by an ass, is also a marvel and, up to now, unparalleled among the peoples of Africa.

I come now to the early history itself, which Wacker, in Section II of his monsion-producing Fourth Part, has closely compared, bit by bit, with the corresponding Sources of the Biblical tradition. It should be noted in this connection that the Germanist, who, as he said our himself, had as longer concerned himself with the early history of Genesis since his childhood, did not recognize all the correspondences at once, but rather had overlooked a few very important ones. Gelin, who himself wrote a brochure in 1908 on "die biblische Urgeschichte /The Biblical early history/ (in the Biblische Zeit- und Streitfragen /Biblical questions of the time and controversial ones/, by Bedeker and Kaspersbeck, Ulmerfelde,

/cic cont./

published by Rev. Sayce, first series, No. 32, had already called attention to his review of Meeker's book in The Reformation, Year 4, 1895, pp. 419-421, to the parallel between the lance-tipped Schagarda and Jubal /Jewel/ Genesis 32, 33. Far more important, however, is the fact that the blood, from the creation of the world to the flood, exactly like the Hebrews in Gen. 4, count seven ancestors, the seventh of whom had three sons, whose correspondence to the Biblical ones is illustrated in the following table /in the original source the table appears in part at the bottom of p. xix and in part at the top of p. xx; in the translation below, the footnotes for each of the two parts will appear at the end of the part/:

Sisthrustha	Adam
Sisuthis	Habel /Abel/ (3)
Gosos (3)	Hesnech /Enoch/

1. Instead of Kain /Cain/. Since among the Babylonians the first murder is put shortly before the flood (in the motivation of sacrificial judgment), there also fails to take place the story of Kain and Habel, which, to be sure, by way of allusion, occurs again in Genesis (at the end of the sth chapter) (cf. Jubal = Habel /Abel/, Jubal = Kain /Cain/ and Tubal = Hesnech /Hanoch/, so the original text probably really has it to be noted that Sisuthis had a brother Cain, from whom the Babylonians are descended (Kain /Cain/, of course, means "blacksmith").

2. He holds the first level, just as, Gen. 4, Kain /Cain/ holds the fire city for Hesnech /Enoch/, which he names Hesnech, after Hesnech's name.

/ge/
973
171

Schagarda (?)	'Ind
Lemajim	Midrajdi /midrajim/
Leeda	Mamalak /mamlawot/
Langeni (?)	Lenek /lenek/

1. Also Gi-Ogarda, where one should compare the consonants with 'Ind (LXX Tadal for Tugal).

2. This perhaps presuming Lenkes instead of Lenek (cf. Gen. 3 Kaines /Qaynu/ instead of Gen. 4 Kain /Qayn/). Here I have tacitly inserted Langeni instead of his brother Tunbeiam (= Neh. cf. Ganim, sch. Hain, rabbi), which is fully justified, since Tunbeiam had three sons by Meipanim (Ochami, Barikam, and Somam (= Sem, Ham, and Japhet), but also by the widow of his adopted brother Langeni, Mahaka-Lagiaja (cf. with this double name the two wives of Lamech, Ada /Adah/ and Zilla /Zillah/), these same sons (who, according to the views of the so-called Jehova must properly be regarded as sons of Langeni), Lenka, Ulignam and Uar-sam (= Jabal, Jubal, and Tubal). Thus, even among the early ancestors of the blood there were closely cor-sisting similar duplicate reports (or variants of myths). Like the parallel line of ancestors, Gen. 4 and 5, among those of the Hebrews. -- Apparently in order to reach the sacred number seven, Gen. 4 omitted Henk, whereas the blood marvellus, on the other hand, the Langeni = Lamek (inserted above by me instead of Tunbeiam); the number was in Gen. 5 (cf. Enoch) was reached on the basis of God (read Elion instead of Adam) and the God-invocatory exclamer (Jack = Jiyng = Adapad).

/<u>ex cont.</u>/

A further correspondence has turned up to now in the four plagues after the flood (Jaritz, pp. 180 f.): 1. sickness (after the five dust), 2. dung beetles (after the negligent killing of a working donkey), 3. grasshoppers (after the deliberate killing of a cow) with locusts following that, and, 4. pestilence (or the <u>murrg</u> epidemic): one should compare this with the expanded list of the ten plagues, Exodus 7 ff., in which the above-mentioned four plagues of the Jewish are all represented, and (as my former student, Dr. Otto Weber, pointed out to me) in the number four, the four plagues of the Babylonian account of the flood (Gunn 197 ff.), lion, jackal, locusts, and pestilence.

With regard to the importing of the ten commandments from the mountain of God, what is characteristic of the situation for the Jewish tradition is that it is not a figure corresponding to Moses that proclaims the sacred laws, but an angel, namely, the <u>mal'ak Jahve</u> of the Old Testament, and, to be sure, in the form of a human being (cf. Daniel 7, 13, and the A.Zipori, i.e., the bird-bird of Bilda in the Babylonian myth) with two wings and but a single leg (5).

5. The description of the angel as a one-legged creature is probably only the naive expression for lame-footed or limping, whereby one is inconsiderately tempted to think of the lame five goat of the Gemin (the Chaldean Nebo, as Nabu-Gibil, is also a five goat) and of Ex. 21, 18 /<u>Ger</u>: see Gen. 32, 32/ (where, according to the correct interpretation, despite 31, 32 /Gen. 32, 32/, not Jacob's leg, but rather that of the angel wrestling with him was out of joint). Lame-footed Schegarsis = Iwal (<u>Ci-Iwal</u> means "the fire came down," cf. Babylonian <u>Ewal-Gibil</u>) also corresponds to Nabu-Nabbu, cf. my brochure: Die alttestamentlichen Denkmäler und die alte Testament /The old Oriental monuments and the Old Testament/, 2nd ed., Berlin, 1903, p. 33. The Egyptian Horus-Seth of Wall and Cross goes back to a similar idea.

/to come/

773
• 171

on account of which he could only move forward by jumps, with the help of a stick: he was called al-Dhiraw /ra/ (from dhiraw, cubit), a name that has been preserved in the Arabic dialect (walking along with a limping step). Among the neighboring people of the al-Mahiraw (cf. the Biblical 'Ivi of people of the Ang. inscriptions, which phonetically has arisen from 'Wawa' and has been preserved in the present-day name of Bahra, north of Khartoum), God is called Dhu (cf. the Biblical Seth, Gen. 5, and what we said about him above, p. xvi, note 5, end), who is supposed to have been worshiped in the form of a male figure with but a single leg and thus probably corresponds to the al-Dhiraw.

I do not believe that the Mosaic story of the lawgiving even necessarily presupposes a knowledge of the proclamation of the Ten Commandments by Moses, in which, indeed, the completion, the so-called Book of the Covenant also belongs (1).

> 1. With the end of the Book of the Covenant (Ex. 23, 19 + 34, 26, "Thou shalt not seethe a kid in its mother's milk"), cf. the same abhorrence toward taking meat and milk together among the Masai, Merker, op. cit and ibid.

but rather that, long before Moses, it was a traditional feature of the original tradition that when commandments were given by God this was always done in tens, the sacred number of the divine "Ennead" and cycle of God, Tetlet: moreover, probably most of the Mosaic commandments already existed before Moses, and the science of this man of God, who surely belongs to history, was only that of assembling them in his consciousness in a new arrangement and augmented by the Book of the Covenant.

194
773
171

This brings me to the last point, namely, the placing together of the Mosaic patriarch al-Dhiraw with the Hebrew and, what seemed disturbed to me from the outset, the old Mosaic Kaaba with the Biblical (originally probably Kenite-Midian) Kaaba/Ark attempted by Merker in Section III of his Papers Part.

/*not copy.*/

If one considers how common Arabian tribal and personal names, such as al-'Ānis, 'Anāfa, 'Anāfa (from 'Anāfiq), are, there is not the slightest reason, in connection with the Anonn, to think of the Anonim, who have played a role only in Palestine and come from the north. More likely al-Ilhonn, if not to be compared with, say, the Arabian al-Ilāhān (Hypostasis Ilāha, which, in any case, is generally equated with the Hebrew Elohim) or another similar-sounding Arabian name, might be identical with 'Ilon, the mythical ancestor of the Hebrews, especially since al-Ilhonn's son Qadim sounds remarkably similar to Ilon's grandson Qē'ā (LXX Phyn, hypocoristic of Qē'ā-el, Regnel) Gen. 11, 18, which again, however, only points directly back to Get Arabia, the original seat of all the western Semites, since the district 'Ilon-Ping (?)

> 1. Cf. in this connection my *Grundzüge* /Outline/ (Munich, 1948), p. 194, note 1.

roughly coincides with the Arabian *Gentes of Jawāfiza*.

While the latest early literature, as they finally become available to teacher after prolonged effort, are still being carefully guarded by a few of the older people, there are also among the myths generally widespread among the latest, such as also because known to Hella in Bitnāh Ewe Ibrāna, some that are to be regarded as close relatives of the recent myths. Among these I cover /only/ what Hella relates (p. 270) about the god Bolonnay (the moth, however, has the feminine article, that the originatrice of the earth, the Ferrone of the land), whom therefore the Ibo of the latest has become a deity, whereas the reverse would be much less understandable: as the lowering of the cattle from heaven (Hella, p. 270; cf. Teacher, p. 300), as the story of Ja-eyo's disobedience (Hella, p. 271), in which I see a fine reminiscence of Teacher's account of the fall, as entirely corresponding with the Bible. If one considers how widespread the planting together of the two of people and sequent one to the ancient Ibiano (up to the Creole), then the preservation of this particular

5. Perhaps one of these is also the noteworthy accord between the name of the primeval dragon (Akkadian: a ~~[illegible]~~ Hebrew, and Ki-Muriu, "place of battle," an originally mythical locality of the ancient Babylonian East Tigris region (Territory of the Zamborum, where the three-headed dragon Dabilla-Zakak was defeated; cf. in addition the three-headed serpent of paradise of the Greek) near Gugallu; cf. also the name of the two [illegible], Mandaic, p. 175, and the above-mentioned (p. 1-13) Greek mythology of Hercules, with which may then perhaps be put the Babylonian gil-la-ma (from gil-la ma-ash, a weapon of the god Gula, probably to be thought of as having a dragon shape (cf. my Grundriss Florilegium, p. 175, footnote 6).

completely exclude any doubt.

/12 cont./

In connection with the somatic view of the Ibeno Ibiaoto, the following have to considered. The land that immigrated into the Ibeno Ibiaoto have been dominant quite pure as a race. They previously never subscribed to the kidnapping of women and children in war, otherwise customary everywhere in Africa, they did not marry Ibgoman and did not take Ibgoman into their community.

Photo 3 plate.

Ill. 3. Ibeno Ibiaoto women.

Therefore they most closely show the racial characteristics peculiar to the Ibiaoto people. The same was true of the Wakwali until the time when they became mulatto. Then, however, they needed not only replacements for their lost castes, but also many hands needed in the cultivation of the soil. For this reason on war expeditions they dragged off, not only the livestock of the enemy, as before, but also the women and children. The degree of mixture between Wakwali and Ibgoman is very different in the individual [illegible] the Ibeno, Wakwali and the Wanderrice -dominant]

/13 cont./

the Ki-ambi also have their own tribes, which will be briefly discussed at a later place.

Corresponding to the uniformity in language, the number words are the same among the Ambeli and Wakuafi, whereas the Ambeli and Ki-ambi have their own words for only a few numbers, but in general always make use of the ones used by the other two branches. One finds a complete correspondence for all three branches in their religious views, and the manner of circumcision ceremony among both sexes. The peculiar circumcision of the boys is practiced by no other people at all, with the exception of one lineage of the Tenga, closely related to the Ambeli people. In birth and death, too, all three have the same customs, while in the use of their customs one finds only unessential differences which are based solely on the difference in their external way of life. The most striking proof for the three branches' belonging together, however, lies in their dances.

The people as a whole are divided into three large tribes, the [illegible] tribes, the Ki-ambiyen, and the Ki-ambiyen, each of which is made up of a number of lineages, and every Ambeli, as well as every Ki-ambi and Ki-ambiyen, is a representative of one of these lineages.

If we now concern ourselves further with the ethnography of the Ambeli in particular, which is at the same time that of the Wakuafi, we are thereby including the ethnographic traits of the entire people the meaning of individual differences that have developed among the Wandwike in the course of time and under the influence of changed conditions will be reserved for the third part.

/[illegible]/

When the Israelites have been driven out of the land to pasture, the women and children man to clean it. Then the fire is lighted in the hole and on it are placed the pots filled with water in which the vegetables are to be cooked. These pots (in [illegible]) are not made by the Israel themselves, but are bought from neighboring tribes or else from the Wanderlies, who presumably learned the potter's art from them. They are a foot high and globular. In contrast to the western, all the occupants of the family bread, especially since the cattle epidemics, eat vegetable food which they buy from the neighboring peoples, since they themselves do not engage in any agriculture at all. Their favorite foods, however, are, of course, milk, meat, and blood. Milk is always drunk by healthy people uncooked, as fresh (in [illegible]) or sour (in [illegible]) [illegible] boiled milk is food for the sick and as curd is usually mixed with pulverized grains of [illegible] (Hebrew [illegible]). Sheep milk is especially popular because of its very high fat content. Blood of cattle, sheep, and goats is drunk fresh or mixed in the clotted state. Milk mixed with fresh or /[illegible]/ cooked blood (in [illegible]) is greatly appreciated; this drink is highly esteemed as invalid soup for the wounded. Cheese making is unknown. Butter is made by agitating the cream in a large gourd-bottle (in [illegible]). Fat, rendered in a pot, is used as an ingredient to other foods, especially meat foods, but is also drunk without any admixture. Meat is prepared without adding salt: it is cooked either with various spices or roasted on a stick at the open fire. One does not eat in one day cooked meat and milk /[illegible]/ together [illegible].

1. This was also forbidden for the Hebrews, according to the 2nd Book of Moses [illegible], 19-24, [illegible], passages which are part of the so-called Yahwist documents, that is, the oldest sources of the Pentateuch.

because the latter together with the [illegible] spice (lack of

/48 cont./

601 The designations ainle, ee gin, aishé, and 'e ghe are used
605 only as long as the above-mentioned terms of address are not
[631] affected by gifts of livestock. This explains why they are used only among children. This does not apply to the address of aiwhe ng ai, because the girl is not in a position to make the necessary gift of livestock.

601 The son and daughter of the brother or of the sister are addressed, as long as they remain in childhood, with ee gerai ai + my child. The address for the grandfather runs ng ainje, for the grandmother baiee. The grandfather calls the grandson ng ainj'ai; [631] the grandmother, baiee ai. Brother-in-law and sister-in-law are [651] called by name or the terms of address derived from livestock designations.

charcoal (eñ gîkuo, ñ gik). The charcoal, in piles the height of a man, is burned out of the wood of the trees ol mokutan (Albizzia anthelmintica), ol kadedemma, ol mandemando, and a few others and then carried to the smithy in skin sacks. A stone (ee mîd l eñ gidoñgore : stone of forging) serves as an anvil. The hammer (ee gisirjedi, el gisirjed, Fig. 21 (1))

1. See p. 150.

has the shape of a pestle, the lower end of which is somewhat compressed. Working with it is pounding, not hammering. The tongs (ol garamet, el garameta, Fig. 22 (1) /see footnote 1 above/) consist of two parts that are joined by a pin mechanism. Their grip arms are long, the grasp arms short. The small striking chisel (Fig. 23 (1) /see footnote 1 above/) (ol oiedge, el oiedgen) has the usual shape. The bellows (eñ gunet, ñ gunet) is /114/ represented in two forms. The one very widespread in Central Africa, which consists of two conical bags made of sheepskin or goatskin (Fig. 24), is the most common. In the lower end of each bag is stuck a wooden plug, like a stopper, through which projects an iron tube 20 centimeters long. In place of the latter there is also often a wooden tube, or for both bags together a forked branch hollowed out like a tube. On the upper, wide end of the bag two sticks are sewed on with small thongs so that they form the opening in a slit. The one using the bellows -- usually an old man or a woman -- grasps with each hand one of the two bags at the upper end, so that they, opened with the stretching of the bellows by spreading out the hands, let air enter. With the following pressing together of the bellows, by squeezing the sticks together, /Figs. 21-25 appear here/ one prevents the air from ebbing back again and drives it through the lower iron tube. Both iron tubes open into a clay tube (ol modi, el modio) lying in the fire. The two bags of the bellows are manipulated in such a way that with the stretching of one the other one is squeezed together at the same time. The other type (Fig. 25) consists of a wooden bowl -- covered with skin for durability -- upon which is tied, airtight, a leather bag that has a round hole on top. In using the bellows, one inserts here the thumb of the right hand and with it stretches the bag upward. With the compressing of the bag the hole is closed with the palm of the hand. Below at the side of the wooden bowl is found the air tube.

[171] [237]

/122 cont./

411 (171) 411 171

sometimes also types, which, however, only in exceptional cases do not closely lean on the general Masai shape. The essential difference between the two types is that the axes of the cross-section (Fig. 22) in /123/ the blade prepared by the Masai smiths stand obliquely to each other; in the one made by the Dorgoon, at right angles to each other. Another difference appears in the lower end of the blade among the long, narrow forms (Fig. 23), which among the former spears is more bean-shaped (x) or also spear-shaped (y).

among the others usually more spade-shaped (1). The first two
[171] shapes, especially the spoon-shaped one, have in more recent
times also been imitated by Dogon smiths, and, to be sure, as I
/[illegible]/ was able to determine in several cases, on the supposed
[174] order of lineal warriors. While the spear shaft is circular above
(172) and below as a rule, one also finds each, particularly in the Ok
Dogon province, among which these parts have a rectangular
diameter and one which notches (Fig. 36) are made as ownership marks of various meanings (2).

1. They may mean: dancer, of honor, tribe or lineage, etc., of the owner.

/Figs. 36-38 appear here./

411
482 On the march the spear is carried, either on the right or on the left, in three different ways, among which the warrior alternates according to convenience. 1. With outstretched arm hanging down, the hand grasps the spear shaft at the spear's center of gravity. The spear lies horizontally, the tip /[illegible]/ directed forward and slightly outward. 2. The spear is carried in the arm, similar to the position of the "gun in the arm." With thumb, index finger, and middle finger the spear shaft is grasped in the middle, so one

[TEXT CONTINUED ON PAGE 173]

/[illegible]/

[illegible] grasps a pencil in writing. 5. The spear is carried on the shoulder, spear which its center of gravity rests. The point is directed diagonally upward; the head exercise the spear done with the fan.

[illegible] The sword (Fig. 11) consists of the sword, wooden kith, provided with transverse grooves, and the bow, double-edged blade. The Korean, according to the economic of the times, has not changed, whereas the blade had undergone a great transformation. Originally it was only 50 centimeters long and had its greatest width of barely two centimeters in the center. At that time the sword resembled a double-edged dagger (Fig. 10) and was suitable only for stabbing.

[illegible]

Fig. 10 h. (1/10) Fig. 10 h. (1/10)

[illegible] Gradually the blade became longer and, in order to be able to use it better for cutting, its center of gravity was put closer to the tip, so that the blade now 80 centimeters long has its greatest width of three centimeters only five centimeters away from the tip. What was said about the cross-section of the spear blade also applies to that of the sword blade: its cross-section is slightly S-shaped (Fig. 10 f), if it is made by Mawi smiths, straight if by Dogro smiths (Fig. 10 g). The

/[illegible]/

[illegible] reception, whereupon the tips of the mouth are wrapped with hair to the length of an inch. The hair hair, lengthened up to 50 centimeters, is placed around a four-long stick and so this wrapped rightly with hair or goat leather wrapped this, so that it forms a stiff head (cf. [illegible]) reaching to the outer. Over this head can not infrequently find one to three similar ones. Often the tips of the little couple beside (illegible) (cf. [illegible]) are joined with that of the larger [illegible] head (cf. [illegible]) and the former and together under the chin form a string (Jacke of Ohem) (b).

[illegible]

1. This hair style has the purpose of preserving the head from the harmful influence of the sun's rays. For this, one first let the hair grow long and, since the long strands fell unsyngly into the face at every movement, put it together into "braids." The Tonga helped themselves more simply, in that they shaved the front part of the head and left the protection of the thick padding of hair on the back part of the head.

[illegible]

The hair is often perfumed with the raw powder of cf. [illegible] (Cassia spec.). /[illegible]/ /Fig. 48 and 51 appear here./

[illegible] The white facial painting of the newly circumcised has already been mentioned. Younger people, especially women and young girls, on all festive occasions, anoint the entire body (and/or so it is not clothed), with red paint, which they like to perfume with the pulverized leaves of cf. [illegible] (Cassia [illegible] Bch.), which smell like vanilla. With one finger the woman then often strip it off the skin leaves in separated lines (cf. [illegible], cf. [illegible]) so that a kind of drawing is produced. One who has killed an enemy in war paints his body at the following dance festivals with white and red earth in stripes (Fig. 47). This painting is called [illegible] /Figs. 47-49 appear here/ [illegible]. At festivals one also often sees on the face of the warriors a red triangle, its apex starting at the ears and widening out up to the middle of the cheeks (Fig. 49). When boys

§12 after the other, from the little finger to the thumb, into the palm of the hand. While one then further counts in like manner on the fingers of the left hand, those of the right are remain closed and only the thumb is moved freely. After turning down the thumb of the left hand, the one counting raises both hands, now closed into fists, and says tunam (= 10). For counting further, one begins anew in the same way and does not continue, say, on the toes.

§13 The Newel count neither human beings nor cattle. It is believed, as the Iwaidhua also did, according to Le Clown, 11, that the one counted would die. Thus, they correctly estimate large multitudes of living creatures in round numbers, and small ones with quite great accuracy. Only dead persons, for example, the Inlaw warriors, are counted individually.

§14 The names of the fingers might be mentioned here: thumb = ol mamu bindi, that is, the big old one. Index finger = ol ngorthol or ol mekonyi, that is, the sorcerer; if one wants to make sorcerer ill through sorcery, one spends the magic medicine under the nail of the index finger and, murmuring a curse, one points with it at the person concerned. Middle finger = ol gudi, that is, actually the stump of that worn regular on the middle finger. Fourth finger = ligara ol gumuja, that is, mother of the little finger, which is called ol gumuja or also ola ilinin.

§15 Ordinals: ol ainthigo = the first /num./, ol lenl = the second /num./, ol lengani = the third /num./; ol ainthigo = the first /ten./, ol lenl = the second /ten./, ol lani = the third /ten./. The /num./ (the /ten./) (general), ol (ol) ainyo the last in the counting of the numerat is called ol ainyo ta gumuj; the one standing on the right end of a row (to the right of the one judging) is called ol ainyo t' ol gaina ainyanai (ol gaina = the hand, ainyanai = on the right), the one standing on the other end, ol ainyo t' ol gaina ainthiaja (ainthiaja = on the left).

Once is called nalai lenl (or nalai gudi) twice, lar' nalai three times, lar' nal, etc.

From page 1

The months of the *al ainelgawd* were: 1. *be bagwije ainelgawd*, also called *alfiri ainelgawd*, that is, the cool-up bulls. As a result of the rich fodder of the seven months, they have become wild; in the pastures they would be commonly fighting with one another, hence they are separated. 2. *bulge* (= middle) *ainelgawd*, or also, but more rarely, called *al ale*. 3. *bulgawd*, that is, *ainelgawd* another distinguishes this month.

The *al ainelgawd* starts with the month *ainelgawd*, that is, *ainelgawd*. The pastures is sparse and as a consequence the cows give too little milk to satisfy all the people. Everyone tries to appropriate for himself some of the milk from the livestock of others, through which *ainelgawd* and *bawdh* arise. Finally the milk no longer extends to sacrificial relations, and the majority of the women with a few exceptions move into the forest for more eating, which usually lasts not only through the entire month, but also even over the next month of *al dulgawd* or *al dulge* or *al dulgawd*, since even then the milk is still very scant. The name seems to be formed from the word *al gawdawd* = food scarcity. But until the beginning of the first month, *al the bawdhawd*, do they return to the hamlet. From the slaughter most meals they feel very strong, and the heavy use of nerve-stimulating meats has affected their nerves to a high degree, and almost daily one or another has a fit of rage (1).

1. Cf. XIX. Nerve Alliness.

The Hamel do not count years. Rather, they designate the year after the event seeming to them the most important one that happened during it, for example, after a livestock epidemic, a drought, the death of the high chief, a war expedition especially rich in spoils, etc. (1).

1. Just as the Babylonians, even in the 3rd millennium B.C., did not count the years, but gave each year a name after an outstanding event in it, especially after the death of the king. One proceeded similarly

[illegible]

Panorama 9 continued to figure, as the so-called Palermo stone has shown (*Hackmann, Geschichte, Geschichte, Abb.*, 1905, 5.)

Proceeding from the present year, one also designates, with the help of yesterday and tomorrow, etc., the next years to the past and future: *ut ut to kyoff* [illegible] (*ut ut* = the year, *kyoto* = yesterday, [illegible] = *[illegible]* elsewhere), last year: *ut ut i ung ainak* [illegible], the year before last: *ut ut i ugoni* [illegible], the last year but two. Furthermore *ut ut* [illegible] (*ut ut* = tomorrow, [illegible] = future), the next year: *ut ut i ung ainak ainak*, the year after next: *ut ut i ugoni ainak* [illegible], etc. Thus very seldom have designations going beyond the last and next year.

204 The only measure peculiar to the island is the hand span (*ug dawan*), measured, with outspread fingers, from the tip of the thumb to that of the middle finger. I saw only that the people measured with this the length of the spear blade, spear shaft, and sword blade, and board saw, upon entering the pure sacred, they designated with so-and-so many hand spans the desired length to the smith.

XVIII.

000 Livestock. -- Cattle. -- Cow. -- Castration. -- Donkeys. -- Goats. -- Sheep. -- Camels. -- Humps for cows. -- Dromedary marks. -- Hand scan for hoarfrost and stigmatizing from the [illegible] of animals. -- Castrating the born stallions. -- Bird entrance. -- Sickness and their treatment. -- Cowbells. -- Tending the livestock. -- Drawing blood. -- Slaughter. -- Cutting up the animal and distributing the meat. -- Nomenclature of the livestock. -- Pasture in the steppe. -- Stockbreeding by the European settler. -- Useful and harmful fodder plants.

233 The island's greatest joy is the ownership of as much livestock as possible; all his thoughts and acts are directed toward preserving and enlarging the herds. The cattle are zebus (*bos indicus*), among

(Cont. page)

[illegible] consciousness returns immediately and the attack passes over into a quiet spell of weeping, whereas after a slight wounding inflicted on another, the patient's excitement is said to increase further. If the outbreak of the attack -- which usually occurs toward evening -- is noticed in time by the women squatting around the patient, a number of them (both themselves upon him, force him to the ground, and hold him firmly until the attack passes. This occurs, as a rule, after half an hour or an hour, but often it lasts somewhat longer. Then a certain sleep follows, interrupted several times by fits of crying and fits of saliva, until toward morning, when a second, somewhat milder attack occurs, during which the patient is treated as before. This second attack is often somewhat briefer than the first and turns into a spell of weeping gradually becoming calmer, which as a rule is soon succeeded by general exhaustion, which ends in deep sleep. After this the patient usually goes on to a speedy recovery; rare cases seem to appear as though still another relapse is to follow, which will be expressed by greater violence of the weeping fits. That there is no third attack is traced back by the people to the fact that the patient was already bewitched during the second one. His companions now guard him more carefully and keep away from him any opportunity for excitement -- even a glimpse of weapons. To hasten a cure, large quantities, a liter and more, of liquid fat is poured into the patient, which he usually also goes over to the preceding stage to alleviate the expected attack. The blood call the attack *ngo lambana*, and the one suffering from it *ni mwenyi lambana*.

As frequent as the severe form of *ngo lambana* is -- since every woman suffers from it several times in the course of her active period, and is to rare if one of these remains spared altogether -- the Europeans will nevertheless usually be able to observe only the much more commonly occurring mild form. Here the long pre-stage is entirely absent or is limited to a few hours or even only minutes, during which the patient sits gloomily and weeps. The attack here lasts about a quarter of an hour to half an hour and ends with general exhaustion followed by sleep. It should also be mentioned that among the [illegible] Negro tribes who live in close contact with the blacks and

[illegible]

[illegible] of their reasons and relieve the reviewer regard becoming stricken with the *ren hanhuan* as a sign of rare, fortunate exception, and they frequently continue to be this reason. Outside sleeping rules the detainee with space to land fallen out of the camp and would easily run before an injury or anyone, even if — as in the *[illegible]* case observed among the Wadelaggo — a few people did not immediately run after him, seize him, and lead him back.

The lack of any visible over reviewer and instructions probably also plays a not unimportant role in the occurrence of *ren hanhuan*. The cause seems to me, however, to lie entirely in the excessive use of the aforementioned sections, so that the illness would not occur at all if they were avoided completely or were taken only to a very considerably lower volume. This hypothesis can be observed almost daily among the reviewer in an abnormal state of nervous irritability. This view is based on my observations (with which all the informants on this point made to me by the blood agree) that only the reviewer, that is, the young, strong, healthy men, are stricken with *ren hanhuan*, while boys and people, before they were into the secretariat of the reviewer, and even during the free period as well, and furthermore married men, as well aright and women, remain completely immune to it. These persons, however, either do not take any of the stimulants named at all, or only in very small measure.

In this description of *ren hanhuan* one is invariably reminded of the *running amok* of the Malays. Only the complex of symptoms is similar, however, while the etiology and the prognosis are entirely different. Whereas running amok as a rule ends with the death of the person concerned, *ren hanhuan* is cured within a few days. Whereas the effect of opium as the original cause of running amok is today no longer regarded as decisive, in every case of *ren hanhuan* the opium use of these agents only a short time before will be indicated.

[illegible]

[illegible] that of an egg or even suspension the member (hand, finger, toe). If this means to be absolutely necessary. After the operation the patient is given one deep kidney to eat and a considerable amount of liquid deep to drink, whenever severe diarrhea sets in. Often one has into go through a sewer case in that he is set over glowing charcoal on which leaves of [illegible] and deep bark are thrown.

[illegible]

On a [illegible] one has a woman who has given birth to twins, [illegible] a pregnant woman spit and rub the saliva over the painful spot. As long as the pain continues, the patient may only use goat [illegible], to which is ascribed some kind of narcotic effect — as is also shown by the fact that it is the only solid food of the [illegible].

[illegible]

Into the wound caused by a poisoned arrow another poison arrow as quickly as possible. At the same time the wounded one is given to an emetic a mixture of the juice of the fruit of an [illegible] [illegible] and the emetic fluid [illegible] of a goat's deep, which is slaughtered for this purpose.

[illegible]

The [illegible] juice of leaves of an [illegible] [illegible] of [illegible] (Gentiana [illegible] Gilg.) and [illegible], or an extract of the leaves of [illegible], is dripped into the eyes.

[illegible]

The surgeon removes the remains of a [illegible] [illegible] eye, by [illegible] it out of the eye socket, with an [illegible] [illegible] shaped, far enough so that he can cut it off with the razor. The eye socket is then washed out with warm water and not bandaged afterwards.

[illegible]

A place that has suffered a sprain or bruise the El dullen rub with the juice of [illegible] (Gentiana spec.). Sometimes they also apply the same drug to the contact of rubbing the powder of the charred [illegible] [illegible] that are made on that place.

[illegible] [illegible] are set again and placed in a splint bandage that is not stiff. For a lower-arm dislocation the surgeon sits on the ground in front of the patient, grasps his lower arm just above the wrist, and sets it again by a gradually stronger pulling exerted in the required direction. He then puts around the affected part, from the middle of the lower arm to that of the upper arm, which are drawn together at an angle of 130°, a padded bandage consisting of a strip of deep leather that is covered with as much thick and soft hair as possible. The padded bandage is tied with a

/[illegible] cont./

[71] by any means depend on immediate and permanent subsistence. Rather, the latter presupposes free of all a vital energy such as a /[illegible]/ people have not to previous circumstances by poverty and disease no longer possessed, and then also no inner urge toward subsistence, relying only to the course of long periods of time through gradually entering new new lessons and views, which concern the future, hereditary inclination toward sensation. Thus, a nomadic people, deprived of its herds, experiences a long stage during which it slowly learns the tilling of the soil and seeks to obtain its necessary and indispensable wear that through hunting. The war and raiding but inherent to the free nomad, whose goal, war, contributes for him an economic resource though the livestock herds thus captured, is a factor that delays the attainment of permanent subsistence. For, first of all, raiders are uncomfortable neighbors when people prefer to drive farther away, and, second, the hunt to livestock prolongs the hybrid existence of the nomadic herd nomads. The yield of the hunt is another factor with the same effect, which undergoes an intensification if the hunter learned the trade at a time in which he could train himself as a hunter-general with the support of well-to-do fellow villagers or their escort.

Now the tradition of the Mount relates that with, or, better, beside and in association with, the general Ural villagers who were impoverished even earlier and more thoroughly than the former and had slowly learned how to acquire by raiding the most had longed for by them. We may therefore expect that they were only able to become sedentary later than the former and that at that time their settling down or agriculturalist will lay far away. New tradition overlaps among them an influential man named El shaw. In him

[72] I think one may recognize Ilan, the ancestor of the Israelites mentioned in 1st Moses /Genesis/ 11, 31 ff., and in the lineage passed after him, the El shaw, the Hebrews. I suspect this not only because of the phonetic similarity of the names, but also for two other reasons.

/[illegible]/

(2) [illegible] El shaddai because the founder of the lineage of the El shaddai, named after him, which already at that time was separated from the present by its nomadic mode of life and had to become separated even further by its continued development. Though this is in most probable that when the origination of the tribal the naming of the name as one of many lineages of a people revealed and was transformed into the conception of a full name.

Furthermore the tradition of the tribal reports that their separation from the present and El shaddai worshiping behind took place at the time the sun of El shaddai. Genesis, Lyrek, and the Biblical account to be known /Genesis/ 11. It says that at the time of Peleg, son of Eber, the earth was divided, which, resultant from the Biblical language and considering the circumstance that the Israelites regarded themselves as the chosen people, beside where other peoples were inferior, contemptible beasts, could mean nothing other than at that time a level drift not without significance for the Hebrew people occurred, within the field of vision of the Hebrew, among the peoples close to them.

/[illegible]/ Accordingly, I think it may be assumed that in the *time* of the primeval age, in whose direct descendants the power-lay tribal regard (Secretive) belonged the oldest traceable component of the Israelites, who, as a Hebrew people, was originally identical with the lineage of the El shaddai.

(3) With regard to the further fate of the El shaddai-Hebrews the tribal tradition reports that they found special support by the agricultural people of the El diwi. (3)

> 1. As a parallel to the peaceful, neighborly association in which, according to the tradition of the tribal, the El shaddai stood with regard to the El diwi, might be interpreted, in the sense of the roaming El diwi - Hartiter /[illegible]/, the report in Genesis 23, in which it is told how Abraham acquired a burial place for Sarah in the land of the Hartiter /[illegible]/ with whom he was on a friendly basis, and further the passage

/[illegible]/

[illegible] /[illegible]/ in Genesis [illegible], [illegible], which reports that Sara, Abraham's grandmother, married two Hurrian /[illegible]/ women, Judith and Basemath /[illegible]/. — This even at that time is one not always easy for Hebrews to find suitable girls of pure Hebrew extraction for marriage as we see from Genesis [illegible] and [illegible], where it reported that Judith /[illegible]/ was believed by his mother, who could not get along with Sara's Hurrian /[illegible]/ wives, to be not for Abram inappropriate in order to fetch himself a Hebrew wife from there. — One should also note, in connection with the name [illegible] there, the name of Judith's daughter by Esau /[illegible]/, Oholi (Genesis [illegible], [illegible]). This evidence seems to me of particular significance because it refers to that more ancient time in which the Hebrews were still culture-poor nomads. One may think as he wants to about the historical value of these passages, but among all the details there is one that may be clung to safely, that these reports are based on the memory of a close contact — and, to be sure, not a brief one, but of longer duration — of the Hebrews with the Hurrians /[illegible]/, which took place during a time that lies at the very beginning of Hebrew history, in those epochs in which the few historical moments are up like islands out of the sea of myths. — The Israel tradition reports further that the [illegible] lived in tents. This, however, is a but form very similar to the one that is still customary today in Asia Minor and Syria, that is to say, in the lands now inhabited by Hurrians

/Tell cont./

> /Remove I continued/ /Blotted/, which was today still Malter the man and paran Ibadiim /Hebrew/ Jacobiate.

and lived in Gaza vicinity. From that it is to be concluded with great probability that they original were camers from Gaza, and this assumption also seems to confirm the use in the direction of the identity of the El shaan and Hebrews.

Just as the El shaan did not consume blood and let the daughter animal blood from the spurted cock artery before cutting it up, so also was it forbidden for the Israelites to consume blood, according to Jer Mawsa /Counsel/ 6, in Ful Mawsa /Functional/ 6, 17; 7, 26-27; 17, 10-14; 15, 28, and 16 Mawsa /Deuteronomy/ 15, 16, 23, 24; 15, 23, a law which here, as is well known, became statement now the daughter ritual. The passages in Ful Mawsa /Functional/ 17, 10, and in 16 Mawsa /Deuteronomy/ 15, 16, 24, and 15, 23, also expressly order that one is to let the blood run out and flow on the ground like water. It is to be continued in this connection that the law of these passages comes from the law book that originally was found around the year 650 when the temple was being repaired, but in reality had only been written then, for the forming of the Eze priesthood that had grown on Kumaritic /Canaanite/ soil took a priority rule. The other passages, however, stem from the so-called Priesty Codex, /Tell/ made by priests who, just like the people for whom it was intended, grew up in exile. If I further add that the blood passages are the only ones in the entire Pentateuch that deal with the prohibition of the consumption of blood, it is doubtless indeed clear that we are dealing here, not with something originally Hebrew, but with a foreign view and imitation. That the prohibition against the consumption of blood could have come to the Hebrews only through the influence of a people practicing agriculture is taught by the fact that, for the Lord sacrada, the blood of Gaz Uzzaeh is a valuable food, which is probably consumed either alone or as an addition to other foods. Just as among the Semitic peoples of Greater Africa after have become sedentary -- avoid contact with Magnes -- so also among the Hebrews does the custom of consuming blood as food seem to have been preserved long after they became sedentary.

and stolen, raised flag, and shouted.

Running grandstand appears to be a deeply impressed national health. Young Pendleys will and and and lighter small patches of effusced green, consideres only one on has four scores. We have watched Wood dance stumbling screen a big state lighting matches on stag seen, leaving a long line of small blazes gradually joining together behind them. We have watched jester and session widens lighting fires, on well on days and seasons. We had mashed plots, that were burned so dark so four times in one year. So we would add to the above explicit reasons for Kennedy, the implied reason that they also have simply because they get some satisfaction out of it.

Fires are lit with matches. Possibly some are started from rubbing flares that get away. Some fires, especially in wooded areas, are started by Randsville heavy hunters (see below). But virtually all the fires whose origins an investigated were lit by Wood.

It seems probable that the coming of Europeans has altered the fire regime by providing large supplies of matches. It is far easier to light fires with matches than by using flint or other primitive means. With fires

every opportunity. There the gunshot is probably no closer one grazing land. During the 20 months of our major study period, we were in sight of the Gap Forest (at the foot of the Gap Escarpment) at least twice a month, often in the valley, and only once did we not see smoke from a fire burning in the trees on South.

Relations with Wildlife

The most significant influence the Masai have exerted upon the wildlife in their protection through excluding hunting tribes from Masailand. The Dorobos are an exception, but there are relatively few Dorobos that they have little effect. The areas of East Africa where the finest assemblages of grassland wildlife still exist are those in Masailand.

The animals Masai hunt or have hunted include buffalo for shields and possibly food, eland for food and the ostrich for tents, and tail hairs (in ornament gourds and fingers, according to Miller, 1968). Lions and cheetahs imperil the defense and for lion manes, and chimpanzee for horns and to spite national park authorities (particularly in the past decade). In times of drought the Masai may spear various animals for defense or to avoid competition for scarce water. They will even spear elephants at such times (Grant, 1957).

Kisonko

174 It is impossible here to digress at length into the realms of pure archaeology, with reference to the Olduwai man, obsidian flakes, etc., but 172 any evidence which throws light on the type of life that the country supported prior to Masai occupation is of interest in relation to the type of culture which the Masai may be expected to attain.

Briefly, then, the evidence shows that immediately below the Rift Wall cultivation under irrigation was practised, and that east of the Rift the country had at one time been inhabited by a tribe fully acquainted with the arts of well-digging and dam-building. These people may have practised agriculture, but there is no evidence to show that they did; their water conservation measures certainly show them as being cattle keepers, since no agricultural community, drawing domestic water only, would sink 50 or 60 wells in one small area, as at Naberera. That a cattle owning community requires such numbers is obvious from the fact that the Masai use nearly every prehistoric well, and have opened many new ones in addition. These same people were possibly responsible for the dams on the south-east flank of Monduli mountain, and perhaps they constructed the irrigation system which the Chagga are alleged to have found on Kilimanjaro.

But the people who dug the Naberera, Makami, Ndedo, Ngasumet and Londergess wells were most certainly pure pastoralists, and were probably responsible for the construction of the rain ponds in this area. A rain pond, liable to dry up, is obviously as useless to a settled agricultural population, as a group of twenty or thirty wells in a confined area. But to a pastoral people two such sources of water in conjunction enable an otherwise inhospitable country to carry a large cattle population.

The only available evidence of settled habitation in the southern area is found near Makami and Londergess. In concentrated areas, one at each of these places, are to be found numerous large kitchen middens, composed of ash and refuse, and containing numerous pot-sherds, bones, and — most important of all — the clay mouths of native bellows, and the clinkers formed when iron ore is smelted.

Thus, throughout the whole of Masai District, the only signs of settlement are associated either with agriculture under irrigation, or with metal work. The rest of the evidence points to the fact that the country was inhabited by nomadic pastoralists. For this reason any other mode of living cannot be expected from the Masai unless by the provision of water a radical change is made in the environment.

B. Sub-tribes and Sections: Sub-tribes — Sections — Kenya Sections — Sections common to Kenya and Tanganyika — Laitayok, clan or section? — Salei — Serenget — Engaruka — Kissongo — Kiteto — Molbo.

619 The early history of the tribe has been summarized above; before turning to recent history, i.e. events occurring within living memory, it is necessary to define the sub-tribes and sections of the Masai, as a record of recent events is mainly a chronicle of civil war and strife between such units.

FL12 Masai FL12

INTRODUCTION

THE present work, by Mr. Hollis, Chief Secretary to the Administration of the East Africa Protectorate, treats of the language, traditions, and customs of the Masai, one of the most interesting and important tribes of those territories. I am not competent—and there must be few people in the world who are—to criticize by the light of independent knowledge the mass of material which he has brought together, and will merely attempt briefly to summarize the information about the race which we now possess. Mr. Hollis's previous contributions to anthropology, his opportunities for studying and daily conversing with the Masai, and his linguistic talents, which are well known to every one in East Africa, are a sufficient guarantee for the thoroughness and excellence of his work. 114

The Masai at present inhabit the inland districts of British and German East Africa from the equator to about 6° S. Few of them are found north of the Line, except an isolated settlement just south of Lake Rudolf, and they seem to avoid both the sea and the great central lakes. Many smaller pieces of water, such as Lakes Naivasha and Nakuru, are found in their haunts, but they neither use boats nor catch fish. They are divided at present into two sections, one of which, called 'L-Oikop, is agricultural and settled, while the other, or Masai proper, is entirely pastoral and nomadic. The difference between the two is evidently not ancient, for both speak practically the same language, and it is probable that the agriculturalists of the present time are nomads who have settled down. On the other hand, tradition does not carry the history of the tribe further back than a century at the most[1], and it would be rash to assume that the nomad pastoral state is primitive or very ancient. It is quite probable that there was a large agricultural settlement on the Uasin-Gishu plateau from which the more adventurous warriors detached themselves. 101 13 [501] [226] 101 [[97]] 173 174

In East Africa the Masai are clearly distinguished by their language, customs, and appearance from the Bantu races (although the latter often imitate them, and have received a certain proportion of Masai blood), and equally clearly 101 144

[1] The genealogy of the medicine men goes back about 200 years.

1: Hollis G-5 (ca. 1894-1904) 1905
FL12 Masai FL12

the case with the Gallas, Somalis, and Abyssinians (who are rapidly encroaching on the Protectorate), and probably with the Bahima. It also seems probable that the physical type of these races (Masai, Nandi, Turkana, Dinka, &c.) represents a mixture between the negro and some other factor. It does not seem to me possible to make any definite statement as to what that factor may be, but the neighbourhood of Egypt and Abyssinia renders several hypotheses plausible. Baker states that the appearance of the Latuka (who are probably the closest allies of the Masai) points to a Galla origin, and that there are Gallas on the east bank of the river Chol only fifty miles east of Latuka, which they have often invaded. It may therefore be that the Nilotic tribes, and possibly also the Hausas to the west, represent a hybrid of the negro and Galla. 174

There is absolutely nothing to show when the Masai moved southwards, but the traditions reported by Mr. Hollis (p. 264, &c.) seem to place the earliest history of the world in an East African setting, and convey no hint of an earlier home. The chief characters in these stories are the Masai, the Dorobo (hunting tribes), and the Bantu (Meek), and the principal event some arrangement by which the Masai obtain a right to all the cattle in the world. This seems to indicate that they must have been a long time in their present haunts, and have lost all remembrance of their origin. Some of the proverbs, such as 'The zebra cannot change his stripes,' and 'Mountain does not meet mountain,' have a familiar oriental ring; but it would be unsafe to speculate how they came to Masailand. 174 173 [539]

A very different view of the past of the Masai is suggested by Merker's recent work (*Die Masai*, Berlin, 1904). He regards them as belonging to the same stock as the ancient Hebrews, and quotes a great number of traditions respecting the creation, deluge, ten commandments, &c. which resemble the Biblical and Babylonian versions of primitive history. A critical examination of these stories is very desirable, as one cannot help suspecting that they contain elements borrowed from Christian or Mohammedan sources. On the other hand, in all questions affecting the origin of East African races, our only data are the most recent types of physique, religion, and language, and we cannot, as in the case of more civilized nations, go back two or three thousand years with comparative certainty. We can form no idea of how many strata of population such a period would represent in Africa; what mixtures and disruptions of races it would include. 174 114 174

The influence of the
791 medicine man is due to his supposed power of prophecy and
787 divination. No explanation is offered of this power, nor does it appear that the Laibons are believed to enjoy the acquaintance and assistance of definite spiritual beings; but they can foretell the future by such methods as throwing stones out of a horn, inspecting the entrails of slaughtered animals, interpreting dreams, and delivering oracles when intoxicated with honey wine. Great, however, as is their influence, it does not appear that either among the Masai or
[171] the Nandi, where similar institutions prevail, they have ever attempted to assume a position like that of the various small sultans of the coast or the kings to the west of Lake Victoria.

791 The most celebrated of these medicine men was Mbatian, the father of the present holder of the office, Lenana, who died about 1890. He is celebrated for having prophesied outbreaks of cattle plague and small-pox, which duly came to pass; and also for having foretold the arrival of white people. It is generally said that he bade the Masai be friendly to them, but Mr. Hollis could not find any corroboration of this statement. His death was followed by
173 a disputed succession. There is considerable discrepancy as to
791 the details of the story, but, according to the versions taken down by Mr. Hollis (p. 327), Mbatian told his eldest son
662 Sendeyo that on the morrow he would invest him with the insignia of a Laibon, of which the principal is an iron club. Lenana, the younger son, overheard, and presented himself before his father very early the next morning. Mbatian, who was very aged and had only one eye, behaved much like Isaac in similar circumstances, and gave his younger son the insignia, saying 'Thou shalt be great among thy brothers and among all the people.' In any case, Lenana succeeded,
791 and was accepted as Laibon by all the Masai except the Loita.
578 This created a division in the tribe, and as it roughly
619 corresponded with the division between British and German territory, Sendeyo was long regarded as the chief of the German Masai and Lenana of the British. But in 1902 Sendeyo quarrelled with the German administration, made his peace with his brother, and came over to the British Protectorate.

776 The religious ideas of the Masai, as collected by Mr. Hollis, are vague and unformulated. The commonest word for God is Eng-aï, which it will be observed is a substantive with a *feminine* article. Eng-aï appears to be used either quite indefinitely and impersonally of remarkable natural phenomena

not correct: they must wait until the medicine-man tells them that the event is about to happen. 787

If the medicine-man is going to prophesy by means of the buffalo or ox horn, and there are people on the road, he tells those present that he will wait, as their feet will spoil his prophecy. They always know when people are coming, even if they are afar off.

When a medicine-man makes medicine, he gets drunk before he prophesies. He sings in parables, and the people reply. [533]

For instance, when the medicine-man named The father of Ngupe made medicine for the warriors of Kilepo before they went on a raiding expedition, he sang: 787 726 [533]

'The bulls that cannot move because they are so fat,
They will be beaten by Kilepo.
The bulls that cannot move because they are so fat,
Half of them have been captured.'

The warriors of Kilepo went on their projected raid against the people of Kahe[1], and captured half of their cattle.

They said: 'Thus prophesied the medicine-man.'

All medicine-men belong to the Kidongi family of the Aiser clan, and they are the descendants of Ol-Oimooja or of E-Sigiriaishi[2], the sons of Ol-le-Mweiya[3]. 791 614 [173]

the people to move their grazing grounds, 'for,' he said, 'all the cattle will die. You will first of all see flies which make hives like bees, then the wild beasts will die, and afterwards the cattle.' 791 787

Both of these prophesies have come true: the Europeans have arrived, and the cattle died.

Mbatian himself died while the cattle plague was raging (circa 1890). 791 173

When on the point of death, he called the elders of Matapato, the sub-district in which he lived, and said to them: 'Do not move from your country for I am about to die, and I will send you cattle from heaven. If you move, you will die of small-pox, your cattle will all perish, you will have to fight with a powerful enemy, and you will be beaten. I wish my successor to be the son to whom I give the medicine-man's insignia. Obey him.'

The elders said: 'Very well,' and left.

When they had gone, Mbatian called his eldest son Sendeyo[1], and said to him: 'Come to-morrow morning for I wish to give you the medicine-man's insignia.' 791 173 662

Sendeyo replied: 'Very well,' and went to lie down.

While this was taking place, Lenana, who had hidden himself in the calf-shed, overheard the conversation. He arose early in the morning and went to his father's hut. On his arrival he said: 'Father I have come.'

[1] Lenana is sometimes said to be the eldest son of Mbatian.

Now disease broke out amongst Sendeyo's people, many of whom died, their cattle all perished, and they were defeated by the Germans; whilst those people who remained with Lenana did not fall ill, and they obtained cattle, as Mbatian had predicted.

The two rivals waged war for many years, and eventually Sendeyo was beaten. He came in 1902 to beg his brother to allow him to live with him, and peace was concluded between the two parties.

Before Lenana dies he will select whichever of his sons is acquainted with the work of the medicine-men to succeed him.

The principal badge of the medicine-man's office is the iron club[1]. If the medicine-man sends a messenger to tell his people anything, he also sends his club so that it may be known that the message comes from him.

Should a medicine-man strike anybody with the iron club, that

supported by the 'L-oitai (i. e. the Masai of the 'L-oita sub-district, near Kilima Njaro), with whom he lived for many years. The warriors of the two parties frequently met in deadly strife, and raided each other's cattle. In 1902 Sendeyo gave up the hopeless conflict, and agreed to acknowledge his brother as chief. He now lives not far from Naivasha. Lenana himself says that he and his three brothers Sendeyo, Neliang, and Tolito were examined by their father a short time before the latter's death, and as he possessed a better knowledge of the work of the medicine-men than his brothers, he was given the iron club, &c., and chosen by the elders as Mbatian's successor.

[1] On one occasion the iron club was lost. A messenger was sent by Lenana to the Government authorities at Nairobi, and when crossing the Uganda Railway he was overtaken by a train. He jumped on one side and saved his life, but dropped the club, which was never found again. Its place was taken for some years by a small iron poker, but another club has now been made.

CHAPTER II.

173 **Origin of the Masai.**

Little is known of the early history of the Masai tribe, but it seems to be an established fact that the original home of this people was the country between the north of Lake Rudolf and the Nile, from which area the Masai are said to have moved in a south-easterly direction so long ago that tradition does not recall any incidents of the exodus, nor the reason therefor.

101 173 **Pastoral and agricultural sections.**

It seems, also, that there were two distinct sections of the Masai, distinct in point of habits of life and customs, though not of language or ancestry, between which sections continual war was waged, wars which now form the greater part of the traditional history of the tribe as it is known at the present day to its members. The sections are usually defined as the agricultural and pastoral sections, the former, known as 'L-Oikop, being more or less settled, while the latter was entirely nomadic, and never practised agriculture in any form. Masai tradition does not extend back for more than one hundred years, but the history of that century shows, to the exclusion of all other topics, a conflict between these two sections, which resulted in the practical annihilation of the 'L-Oikop, who have now ceased to exist, with the exception of small settlements found at Nguruman, to the north of Lake Natron, two villages, Great and Little Njemps, to the south of Lake Baringo, possibly the so-called Uasin Gishu Masai, now located near Eldama Ravine, and in Kavirondo country, and certain individual settlements of Masai among neighbouring tribes, where they have assimilated the customs and adopted the language of their protectors, and from whom it is now difficult to distinguish them.

[361]

Settlements of 'L-Oikop.

174 114 **Sir Charles Eliot's theory.**

The theory suggested by Sir Charles Eliot, is that the nomad pastoral state cannot be assumed to be primitive or very ancient, and that it is quite probable that there was a large agricultural settlement on the Uasin Gishu plateau, from which the more adventurous of the warriors detached themselves.

177 **European influence.**

It is this conflict which made the Masai name what it was and which has rendered so complex the question of the administration of the conquering pastoral section. The victors depended entirely on cattle for their means of subsistence, and were driven to raiding other tribes, in order to amass sufficient herds of cattle. The introduction of the European element, therefore, deprived the Masai of their one pursuit, and had the inevitable result of reducing the Masai from the first to a very low rank of economic importance among East African tribes.

[921]

101 **Wakwavi.**

The term Wakwavi (Wakuafi of Krapf) is frequently used by the early writers in reference to the Masai, but it appears that this term has, in fact, no connection with the agricultural section, being merely a Swahili nickname borrowed from the Masai Kwavi or Kwapi, meaning places.

7: Hailey G-4 (No date) 1950 FL12 Masai FL12

000 Mbugwe are Bantu. There is also a small group of Tindiga, leading virtually a bushman life in the Lake Eyasi basin, to whom reference was made in Section I.[1] There would appear to have been a movement both northward and southward on the part of the tribes, who were previously contained in a very small area by the Masai invasion of the early part of the century.

THE MASAI DISTRICT

131 The Masai District forms the southern portion of the large block of country
161 in Tanganyika and Kenya, extending to no less than 21½ million acres in extent, occupied by the Masai tribe, whose numbers were given in the 1931 Census as 48,945 in Kenya and as 47,276 in the 1948 Census in Tanganyika. There will be found in the Chapter dealing with Kenya Colony further reference to the tribal characteristics of the Masai, and it will be sufficient to give here only those facts which bear in particular on the position they occupy in Tanganyika.[2]

174 The southern movement of this tribe from the neighbourhood of Lake Rudolf seems to have come to an end about the middle of last century, but its spearheads had in 1830 penetrated as far south as the Great Ruaha River and even to Uhehe in the Iringa District, whence they were driven back by the Gogo and Hehe. There were many isolated Masai raids after that time, but these were in the main carried out by Kenya Masai, whose incursions were directed towards the coastal areas on the east, and indeed took them on occasion as far as Mombasa. The Masai settled in Tanganyika do not seem to have attempted a further movement of any importance into the neighbouring areas of the Territory.

175 The Anglo-German Agreement of 1890 cut the Masai country into two parts, roughly equal in area, though the population remaining under the British
101 jurisdiction was somewhat larger than that which fell under German rule. The result was to make an effective division between the Kenya and Tanganyika Masai, and though the two sections have retained a community of racial interest, this has not extended to the political field. Such political unity as the Masai people possessed had existed largely for war puposes, and in peace time political as apart from religious authority was dispersed among the headmen exercising control over the groups having a customary right of pasturage in particular localities. There was moreover lacking in the case of the Tanganyika Masai a motive which might have led them to identify themselves with the Kenya Masai, namely, the need for protecting their lands from alienation by Government for the benefit of Europeans. The troubles created in Kenya by the efforts of Europeans to secure possession of Masai lands[3] were not repeated in
[C48] Tanganyika, where the Masai have remained undisturbed in the occupation of the country they held at the period when European rule was established.

131 The present Masai District comprises, in the north, the Loliondo area, the
133 dominant feature of which is the vast Serengeti plain, with the extinct volcanoes which mark its southern end. In the centre, south of the Rift Wall, the plateau
[312] type of country is characterized by volcanic hill masses, which provide a number of permanent water sources. In the South lie extensive thorn scrub steppes, with a low and very variable rainfall.

311 Practically the whole of the area included in the District is used only for
101 pastoral puposes. If tradition is correct in holding that the tribe was once
173

[1] See page 216.

7: Hailey G-4 (No date) 1950 FL12 Masai FL12

divided into two sections, the agricultural ('l-oikop) and the pastoral Masai, there now remains in Tanganyika little vestige of the former.[1] A few scattered plots are cultivated by Masai, but it is with the help of alien labour. For the rest, there a little cultivation by the small Sonjo Tribe (3,521 in the 1948 Census), a people living below the Rift Wall who have not been assimilated by the Masai. The only other tribe in the District, the Dorobo (believed to number about 1,500), who are known traditionally as the "hunting people," are possibly a survival of the original inhabitants, and have become practically a servile class to the Masai.

As a pastoral people the Masai are semi-nomadic in the sense that they move with their herds in order to avail themselves of the seasonal variations in water supplies, so that they in effect practise a system of rotational grazing. They are credited with the possession of three-quarters of a million cattle and large herds of sheep and goats, but the number of their stock is subject to large and rapid variation in times of drought, and moreover East Coast fever, rinderpest and other diseases take a heavy toll of them. In the late 'eighties a combination of drought and disease almost wiped out their cattle and greatly reduced the numbers of the people themselves. Though like many other African pastoral tribes they make a cult of their cattle, they show little interest in improving their quality, and in the past have been prepared to dispose of them only in so far as they might need cash for their Poll Tax or for the few articles of food required to satisfy a people whose ordinary diet is limited to milk, meat and blood. To some extent, this position was improved during the recent War, which provided a stimulus to production of beasts for sale.

From an economic point of view therefore the Masai present a difficult problem, since the contribution they make to the economy of the Territory does little to justify their occupation of so extensive an area as twelve million acres. From a social point of view they are also a problem, owing to their reluctance to avail themselves of facilities for education. And as will be further explained in the following pages, they present an equally difficult problem of native administration, for their social system is still reminiscent of a period when their chief concern was in fighting or raiding at the expense of their neighbours.

THE FORMATION OF THE SYSTEM OF NATIVE AUTHORITIES

As already indicated, the diverse social and economic conditions prevailing in different parts of the Province have been reflected in the variety of forms taken by the Native Authorities as now constituted. Before, however, proceeding to describe these in detail, it will be convenient to give here a statement which summarizes their chief features. See page 284.

THE MOSHI NATIVE AUTHORITIES

In the Moshi District the present formation of the Chagga Native Authorities is the result of a somewhat radical reorganization carried out in 1946. Up to that time the Chagga had been split up over nineteen chiefdoms, divided from each other not only physically by the deep ravines of the mountain side, but also politically by the obstinate clan feuds and jealousies of past days. These chiefdoms were all treated as of equal standing, though their jurisdiction varied from 11,500 taxpayers in the Machame chiefdom to 400 in the Mrao. They were united in a Council of Chagga Chiefs, which was conspicuous mainly

[1] The Masai, A. C. Hollis, 1905, page xi and xiv.

Kisonko

years ago, the latter were located in the area lying to the north and west of Lake Rudolph. 174

The Masai themselves carry their history back to a time when they lived in a lowland called Kieru; this cannot be other than the desert region lying between Lake Rudolph and the Kenya Highlands. The following is the story of their exodus from that area. 173

An elder, Maasinda, constructed a ladder or staircase up the scarp, which, till then, had prevented the Masai from moving south; on the plateau beyond he found good grazing and water. He consequently arranged to migrate, and he and his six sons, followed by the Laikipiak and the Kwavi, successfully negotiated the climb with all their cattle and possessions. The remaining Masai, who had previously been instructed to follow in an agreed order, then rushed the ladder, which broke under them. They were thus unable to follow.

The scarp is named Endigirr oo Namuga (the scarp of the sandals) and the country at the top Olkeju lol dugha (the river of palms). At this latter place Maasinda met with the Laitayok, the Uasingishu and Siria Masai, and the Kipsikis (Lumbwa).

Maasinda has become the culture hero of the Masai, to whom numerous legends have been attached. In one it is alleged that a woman, Naiterokop, came down from Heaven and bore two sons, Maasinda and ol Meek, this being the origin of the Masai and the Bantu. Maasinda is believed to have ordered the Masai to live at peace with their neighbours and, in the event of war, never to kill women or children. The invention of branding cattle as a means of identification is also attributed to him. 173 173

His six sons are also alleged to have been the founders of the existing Masai clans, Morungiro being the founder of the Laiser, Lolkesen of the Mokasen, Lesita of the Mamasita, Lelyan of the Molelyan, and Lesero of the Tarosero. The name of the founder of the Lughumae is not recorded. [614]

The next event in tribal history is the acquisition by the Masai of the Medicine Man or Laibonok. The legend of the members of the Laiser clan finding a heaven-born child on Ngong Mountain is recorded by Hollis, who also gives a genealogy in which Lenana's name is the ninth. If thirty years is allowed for each generation (possibly an underestimate, since primogeniture is not the rule of succession), the first laibon must have been found about the year 1640. This agrees with all my informants, who state that this event took place prior to the earliest remembered age grade, i.e. before the beginning of the eighteenth century. 174 173

From the fact that the finding of the laibon took place at Ngong, it may be presumed that the period from the exodus to this event was one of slow penetration southward through the Kenya Highlands.

Contrary to the evidence previously recorded, it appears that the advance guard of the Masai had penetrated as far south as Usagara (Mpwapwa District) and made contact with the Hehe by the beginning of the nineteenth century. The story is that when the Merishari were reaching the age of circumcision, two big bomas penetrated into Gogo country to a place called Muli (Masai) or Lodi (Gogo) in search of grass. The leaders of the movement were two uncircumcised youths. One of 173

173 the bomas subsequently returned north, the other went as far south as Usagara. Laibon Subet sent instructions to this boma to return, but they disobeyed his order so were brought back by force. The descendants of the members of this boma are to-day known as il Muli.

The first half of the nineteenth century was a period of consolidation in the area now known as Tanganyika. To nearly every area of the Masai District there is attached a legend of how, and by and from whom it was conquered; examples of these are quoted below.

The Lake Manyara area was in the old days inhabited by a pastoral tribe known to the Masai as il Adoru. From descriptions it would appear that this tribe was one of the branches of the Tatog group, possibly the Barabaig. The moran of the Merishari age had a pitched battle on one side of a rain pond or lake, now known as Balbal lol Merishari, and there defeated one half of the Adoru warriors. The remainder stood drawn up on the far side of the lake and urged the Masai to attack. The latter consequently waded into the lake until the water reached their necks, but were unable to cross. They were thus left floundering whilst the balance of the Adoru made good their escape.

The Kidotu age was responsible for the capture of the Naberera wells from the Lumbwa or Kwavi. The Lumbwa made their escape whilst each Masai was engaged in pegging out a claim to the captured wells. The Lumbwa laibon, father of the present one, closed the pass to the west of Naberera, Engamata o ndareta, by magical means, which prevented pursuit by the Masai. It is alleged that, to the present day, no Masai will pass the spot where the medicine was placed without throwing a stone on to a cairn which has thus grown up there.

A third story also concerns the Lumbwa, this time those of Sanya. Two Lumbwa manyattas, known as Sabuki and Sitet, fled before the onslaught of the earlier Dwati moran, and following down the Ruvu valley, then cut across country and inhabited an area near Kilosa known as Kilena. Here they fought with the local inhabitants; the Sabuki, being beaten, retreated back to Nguu country. The Sitet, however, penetrated southward, where they found a large crater similar to Ngorongoro. They closed the pass by which they had entered the crater with stones and wild fig trees, and there lived at peace till a German was led to the place by a dog.

173 It is as well at this point to examine the origins of these Lumbwa or
174 Kwavi. The Masai regard themselves as having a common origin with
114 the Lumbwa, and consider that only recently have the latter diverged from Masai ways and taken to agriculture. As evidence the Masai cite physical appearance, common language and customs, and historical data. On the other hand, Elliot in the introduction to Hollis talks of the agricultural and pastoral sections and says that "it would be rash to assume that the nomad pastoral state is primitive or very ancient." Hollis states that "the Coast people termed them without discrimination Wa-Masai or Wa-Kwavi, names which have been perpetuated by Krapf and others." It would appear that this lack of discrimination was due to the fact that at the time when Krapf was writing (circ. 1850) the Masai

9:Fosbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

and Lumbwa were indistinguishable, merely two sub-tribes of a pastoral tribe, indulging in civil war; c.f. Krapf—"the two kindred tribes the Wakuafi and the Masai hate each other mortally, which is, however, a fortunate circumstance for the weaker African tribes"; Thomson also regards the Masai and Kwavi as two sections of the same pastoral tribe, and records in detail the ascendancy of the former. As he was writing fifty years ago, when all phases of the civil war were well within living memory, his account may certainly be accepted as correct. Elliot's suggestion that the nomads are offshoots from an agricultural Masai tribe is also discounted by legends recorded since he wrote, notably that of the exodus. 173 174 114

The first part of this section, dealing with events occurring prior to those within living memory, may well be closed with a review of the state of affairs circa 1869, a survey of the tribes dispossessed by the Masai, and an examination of any evidence throwing light on the era prior to Masai invasion. Subet, who died about 1860, was settled at Lashaine, below the present District Office at Mondul, with Rasharasha as his main water. He was surrounded by members of the Engidong clan at Musa, Engare ol Motonyi and Olgeju Lolera. The Arusha were established on the slopes of Mount Meru, and the Masai effectively occupied an area corresponding closely to their present boundaries. They had suffered a severe famine about 1830, but owing to the warlike efforts of the first Dwati age the country was by this time fully restocked. The Nyangusi, a few of whom are alive to-day (1939), were carrying on border wars with the Nguu, Gogo and Mbulu tribes, and it is doubtful whether Karatu, Talamai or Kiteto were as yet in Masai hands. On the other hand, they at this time possessed areas now lost to them, as for example the country between the east bank of the Ruvu and the Pare Hills, extending as far south as Bwiko; the alienated and reserved areas around Kilimanjaro, Meru and Mondul; and the country between the Naberera-Kibaya road and the Kondoa Hills, now lost to "fly". 175

To the west of, and also immediately below the Rift Wall, the country was probably inhabited by at least three tribes, the il Datwa lol Orokishu (Mbulu ?), the il Datwa lol Kuroto (Mbugwe ?) and the Sonjo. It seems likely that at any rate some of these tribes practised agriculture under irrigation, but that they possessed cattle also is almost certain. The Manyara area, as shown above, was in possession of the Adoru, a pastoral tribe, whilst the Mondul, Mweandet, Engare Nanyuki and Simanjiro areas were occupied by the Iligolala, again pastoralists, said to have been akin to the Masai.

Further south, Masai tradition of previous habitation, except by the various tribes of Dorobo, is lacking, owing to the fact that the Lumbwa and not the Masai evicted the previous occupants, if any. It is possible that the Nguu and Burungi tribes extended slightly farther to the north than they do at present, but existing climatic conditions indicate that, at most, these people have lost no more than a few border waters to the Masai.

SECTION II. THE LAIBON.

NOTE.—*Numbers following names refer to Genealogical Chart.* 128

The aim of this section is to record the functions of the laibon, or Masai Medicine Man, and the Masai attitude to him and his work, to study the character of recent laibonok, and the adaptations they have made under modern conditions, and from an analysis of these factors to consider what place the laibon should take in tribal government. One is apt to lose the main thread of such a thesis in a mass of detail, and for this reason many incidents will be omitted when they only confirm what has already been illustrated by example. Facts which are known to run counter to the general argument are, however, recorded. 791

A. History — recent origins — development — the three types of Medicine man — rules of succession.

The Masai legend of the origin of the laibon is recorded by Hollis. Briefly, a youth, ol-le-Mweiya by name, was found sitting on the top of Ngong Mountain, was adopted by the Laiser clan, and proved himself to be a great medicine man. This occurred about ten generations ago. The only difference between this legend and the one generally current in Kisongo is that Kidongoi (2), shown as the son of the original laibon in the Hollis genealogy, is regarded by most elders as the first laibon. 173 791

One interesting fact arises from the legend, namely that the Masai had penetrated as far as Ngong before they adopted a laibon, thus their original move and occupation of the Kenya Highlands must have been made without the supernatural guidance which the laibon alone can provide. On evidence which need not be recorded here, it seems certain that the Masai, whose age grade custom so closely approaches that of the Galla, were possessed of their present military organisation prior to leaving their original home. Thus it appears that the laibon is a later adaptation imposed on a self-sufficient organisation of government through age grades. Probably much of the confusion of function which exists to-day, the indefinite division of governmental authority between the laibon and the age-set leaders, is due to the adoption of an institution incompatible with the original culture. It would be wrong to regard the institution as being foreign to Masai nature, but it is probably true that it is a feature which had not found its true level in the tribal structure when European influence intervened. 182 791

Assuming that the institution is but recently acquired, its development can be deduced from similar occurrences to-day. For there are, generally speaking, three types of laibon to be found at present. First, there is the private practitioner who, for suitable remuneration, will perform such services as curing sickness, removing barrenness and insuring fidelity in wives. He is only consulted by individual patients. The next stage is when a private practitioner has acquired such a reputation that he is consulted by a deputation on behalf of a group of Masai, and provides charms and lays down a ceremonial to be utilized to the advantage of the whole group. Such practices are alleged to be efficacious for the above-mentioned complaints, and may also prove useful in procuring 791

12: Fox G-5 (1925-1930) 1930 FL12 Masai FL12
Kenya

777 It is lucky to see a fish eagle (*Il Aropellis*) sitting on a tree if it is facing the observer. It is unlucky to see a single wild pig, but lucky if a number of pigs cross the path from left to right in front of the traveller.

There are several other superstitions, but they seem to be held in little, if any, more importance than most of our own, *e.g.* seeing the new moon through glass, encountering magpies, spitting when a hare crosses one's path, etc.

514 596 *Spitting* is a greeting and brings good luck. One is asked to spit on a new-born baby. I have sometimes been spat on in a similar way by very old men and women—a somewhat trying ordeal which had to be patiently endured. Moreover, a Masai may spit on his palm before shaking hands in order to give an exceptionally warm greeting. It is then etiquette to follow his example.

173 *History.*—The Masai have little historical tradition. Some of it is given in Hollis, pp. 266–273. They are said to have come from a place in the North called by them *Endigir* a hundred generations (of 15 years each) ago. The generation names from the present time, working backwards as far as they are remembered, are:—*Il Tuati, Il Tulala, 'L Aimer, Il Nyangusi, Il Tuati, Il Kidatu, I Meriahare, Il Tiapi, Il Sokonk*, and *Il Meshepe*. Those before this have been forgotten. When they left Endigir there were no *Laibons*, so the elders arranged about the ceremonies. The warrior and age-group system was already in being, having been instituted by Naitera Kop (*see* Hollis, p. 266). The customs of group marriage and of free love between the warriors and the girls were also in existence.

There were four tribes in Endigir—the Masai, the Dorobo, the Kikuyu and the Il Kumoo (smiths). God gave the cattle to the Masai and the wild beasts to the Dorobo. He told the Kikuyu to go to the mountains and the place of many rivers and to eat grass. He gave iron to the smiths and provided them with stones to beat it with. These four tribes were all friends together.

262 *Restrictions as to Food.*—Besides those mentioned above as applying to warriors and junior elders, the following apply to all Masai:—

They must not eat the flesh of wild animals.

They must not drink milk soon after eating meat.

Women must not be seen eating meat or drinking milk by men of their husband's generation.

805 *Months and Days.*—The Masai divide the year into the following months:—

Ol Adeale. Meaning unknown

Or'at — Grass in the hollows. (About February.)

O Ängi Oing'ok — When the bulls are tied up.

Ol o Ingueria ol o Inpukua — When the Pleiades are in the West.

Ol o Ole-pungi Inpukua — When the Pleiades are in the East.

Ol Gaja Orok — The short black bristles. So called because it is the month of ceremonies, and therefore heads are shaved.

Nandi FL13

DDO taken to a pastoral and agricultural life; the Iraqw and Gorowa are pastoral and agricultural hill people.

TRIBAL TRADITIONS

Nandi Group

N 173 174 Traditions of the Nandi stock take the group northwards to Kamalinga (Nepak), a hill 45 miles north-west of Mount Elgon; but beyond this point we can only speculate. Traditions of the Pok describe the Nandi, Pok, and Sapei as living on Elgon (from the top of which, they say, a stream of fire ran down in past times).[9]

The movements of the group seem to have been somewhat as follows. The first concentration of Nandi-speakers was undoubtedly on Mount Elgon. The Hill Suk were perhaps the first to break away from Elgon. They were followed by the ancestors of the Tuken and Keyo of the Rift Valley, while another body went south and became the Kipsikis, from whom the Terik are an offshoot. The Nandi came into existence through the settlement on the southern escarpment that bears their name of some people from the Kony of Elgon under the leadership of a man named Kakipoc, about the beginning of the 17th century; these were joined by others from the Kipsikis, Keyo, and Tuken. It is curious that though Kakipoc was a Kony, relations with the Kony have seldom been noticeably friendly, for the Kony were one of the Nandi tribes raided by the Nandi. Between the Kipsikis and the Nandi, however, there seems always to have been friendship, for the Nandi describe themselves and the Kipsikis as "one people."[10] Friendship with the Keyo and Tuken has been intermittent. After their establishment on the escarpment, the Nandi gradually spread northwards, reaching the Kipkaren valley some time during the 19th century, perhaps about 1860–70. Most of their history till about 1860 is concerned with the Il-Wuasin-kishu Masai who lived alongside them on the east, with no natural barrier to prevent the Masai from entering Nandi whenever they pleased, for at this time the Nandi, though a tribe of warrior herdsmen, were probably not very powerful, and had perhaps only about the middle of the 19th century begun to adopt their present distinctive arms and ornaments. Moreover it was probably not till after the disappearance of the Il-Wuasin-kishu that they became the formidable fighting people that they were latterly.

The Suk are divided into the Hill Suk, who hunt, practise agriculture with a system of channel irrigation, and keep only a few cattle; and the Plains Suk, who are pastoral. The Hill Suk, who may have provided the tribal language which is spoken by both Hill and Plains people, appear to have broken off from the settlement of the Nandi stock on Elgon, and settled in the Suk hills to the east. The Plains Suk, on the other hand, seem to be the people with whom Turkana tradition claims an early association in the country east of the Karamojog escarpment, and whom the Turkana after a time drove south-eastwards out of this area. This division of the Suk is divided into two sections, Kasauria and Kipiekit, according to Beech, and formerly lived on the north side of the Turkwel River. They made several unsuccessful attempts to settle in the Kerio valley, from which they were prevented by the Turkana and Sambur; and it was not till the Sambur had been defeated that they were able to maintain a footing there; and their final establishment did not take place till the Sambur had been weakened by Masai inter-tribal wars.

Masai

M 173 Masai traditions of origin do no more than say that they came from the north; it is possible that the country round the south end of Lake Rudolf saw the first differentiation of Masai as we now know them. A Sambur tradition says that the first Sambur was found on the Loroki plateau; and traditions of the laibon clan, Il-

[9] C. W. Hobley in *JAI*, 1903, XXXIII, p. 332.

[10] Contiguity of "spirit-lands" and consequent equality of the ritual status of the land of both Kipsikis and Nandi may account partly for this relationship.

13:Huntingford E-4 (no date) 1953 FL12 Masai FL12
Nandi FL13

Aiser, relate how the first laibon, Ole Mueiya, was found on the Ngong hills near Nairobi; and as an historical person, the first laibon may go back to about the middle of the 17th century. The Masai tribes were at the height of their power between about 1800 and 1850. They raided far and wide, and even Mombasa and other places on the coast were not safe from them. So constant were their raids, and so great the fear they inspired, that many Bantu tribes, notably the Kikuyu, and to a lesser extent the Caga, Shashi, Taveta, and others, copied their arms, ornaments, and even institutions. To the Masai, however, must be given the credit for preserving—unintentionally, of course—the highlands from the slave trade, for no caravan got through without their permission, and the road was often closed for months on end. About 1840 the Il-Wuasin-kishu were defeated by the Il-Aikipiak in Nandi—the beginning of the overthrow of this tribe which was completed some 10 years later by an alliance between the Il-Aikipiak and Il-Kinopop, the defeated laibons taking refuge in Nandi. The Kisonko reached the southern limit of their expansion about 1830, their way being blocked by the Bantu of Tanganyika Territory; and about this time the Masai and Caga came into conflict over grazing grounds, the Masai being successful as long as they kept to the plains. In the middle of the century the Sambur were forced south by the Turkana, and the survivors of a section called Il-Doigio having lost their cattle took to agriculture at Njempa near Lake Baringo. About 1880 the great rinderpest epidemic spread over much of East Africa, and the herds of the Naivasha and Laikipia Masai suffered heavily from it. In 1892 an outbreak of smallpox reduced the numbers of the Masai, already weakened by inter-tribal war, and they became a prey to the Kikuyu; had the Europeans not come at this juncture, the Masai would have been reduced to serious straits under the combined attacks of disease and human enemies. At the death, about 1890, of Mbatyany, the great laibon of the Loitai, the central Masai were split by the feud between his sons, Ol-onana (Lenana) and Sendeu, over the succession. Most of the Loitai and Kaputie supported Ol-onana, but Sendeu was successful for a time, till the Il-Purko joined the followers of Ol-onana, and Sendeu was eventually defeated and forced to seek peace. Three other tribes in the Naivasha district had backed Sendeu, which gives some idea of the state of disunity into which the people had been thrown during their decline.

CULTURAL SUMMARY

The Nandi and Masai form a distinct culture group; but the Suk, though they share certain of these features, have so much affinity with the Karamojoŋ culture that they stand alone in the Nandi group from the cultural point of view. Certain features of these cultures are distinctive, and can best be shown in tabular form:

A.

	Karamojoŋ Culture: Labwor and Turkana	Suk	Masai and Nandi
Shields: long and narrow	Yes	Yes	No
Chignons	Yes	Yes	No
Wrist and finger knives	Yes	Yes	No
Skin capes (males)	Yes	Yes	No
Lip plugs and nose discs	Yes	Yes	No
Headrest-stools	Yes	Yes	No

114 and their imageless worship of God ("they have definite prayers
776 and they petition the deity more frequently and fervently than
782 the surrounding tribes are known to do" /cited in English/), stand
113 unquestionably, just as generally a comparison of the book by Hollis, appearing shortly after Merker's book, with Merker's Masai is the best apologia for the reliability of Merker's ethnological as well as linguistic observations.

114 Another outstanding African scholar, the praiseworthy, well-
174 known linguist Carl Meinhof of Berlin (now Hamburg), has above all, and, to be sure, for linguistic reasons, turned against Merker's designation of the Masai as a "Semite people," and with that then also at the same time against their onetime ancestral home in Arabia (2).

[113] 2. Cf. his review in Zeitschr. f. Ethnol., 36, 1904, pp. 735-744.

But what the Arabist Schwally (in Giessen) said about the Masai traditions (Archiv für Rel.-Gesch., IX, 1906, p. 505), that here "features of Semitic origin are well grafted on African ones" (but "when and under what circumstances is hard to say"), also applies to the language, as I was able to convince myself by a thorough study of Hollis' book. Definite remains show that the Masai must once have been Semites, and, to be sure, Arabian Semites. This will be briefly discussed in what follows next.

174 Not only does their own tradition teach that they came from
197 the north, but this is also confirmed by a comparison of some of
[173] their number words with those /xv/ of the Cushitic languages
[113] (especially Somali and Galla) and of Nuba. One should compare
[80] the following lists, to which I have also further added the number words of Nandi, closely related to the Masai, from the new book by Hollis (The Nandi, their language and folklore, with Introduction by C. Eliot, Oxford, 1909):

/7 cont./

000 against the former. The El kuafi recognized the chief (ol oiboni)
174 of the Masai as also their own and seem for a long time to have
184 been on the best of terms with them. Then -- so the tradition
669 tells -- a girl named Matangó, from the family of the ol oiboni
619 Sitonik -- she is usually designated as his sister, more rarely as
726 his aunt -- took a fancy to a member of a legation of El kuafi
[173] warriors sent to Sitonik and went away with her lover. When she bore him a son, the El kuafi proclaimed him their ol oiboni and at the same time refused to obey Sitonik. With this the wars began between Masai and El kuafi. They lasted -- so it seems -- the entire first half of the nineteenth century and occurred sporadically even in the second half of it. One of the decisive battles was at Kisongo, a six-hour march west of Meruberg /Mt. Meru/, where later on the chiefs of the Masai took up their permanent /8/ residence. The ones driven away went into the rugged forests of
[466] Meruberg, where they lived for a long time in constant strife with the Masai, until the chief Mbatyan completely subjugated them and forced them into compulsory service. Other battles took place near Ngurumán, north of Lake Natron; the rest of those conquered still live there, mixed with Wasegedju from nearby Sonjo. The
[361] remnants of the ones defeated in the Serengeti steppe are still to be found in Taveta, Kahe, Aruscha-tschini. The first battles between Masai and El kuafi probably took place in the vicinity of Kenia /Mt. Kenya/, and led to making the latter sedentary.

One of the last great clashes was in the steppe area Sogonoi; the ones conquered fled to Ngujuka and then farther to Useguha and Mahga, where they founded a settlement under the chief 'Lemá.

174 The Masai took a few individuals from among the defeated
184 into their community. The rest split up. One -- larger -- part
619 became sedentary and formed some colonies in the vicinity of
[361] foreign tribes or merged with other tribes. Another -- smaller --
[721] part at first made a living for a time from hunting, until it
[231] succeeded, by means of raids against sedentary peoples, in coming
[101] into the possession of livestock again. Today they again live wholly as before and are distinguished from the Masai only by

M 614 [186] /18/ The 'L aisẽr and El mũleljan to a certain extent stand in contrast to the El meñgana, whom they half-mockingly, half-abusively also call 'N dalata-gutok (1)

M [192]

1. 'N dalata, gluttons, en gutok, the mouth; by putting the two words together the idea of the first is supposed to be intensified.

or Eñg-adji-nagúl-alai (2),

M [192]

2. = the house of the hard teeth; nagúl = hard, el alai, the teeth.

and, in contradistinction to them, designate themselves as Eñg adji el masai. As the reason for this, tradition relates that the El meñgana were once separated for a longer period of time from the other two tribes and, upon reuniting, made a bad impression because they no longer observed the divine commandment forbidding the killing of female animals for consumption. This gave rise to the above nicknames, which, freely translated, mean "greedy gluttons."

M [173] [784]

M 613 The El bedẽs and El goré are not infrequently designated as El aisegela, a name formed after that of a war leader, Os segẽl. As the reason for the combination, it was said that members of the two sublineages were once notorious cattle thieves.

M 791 The most outstanding lineage, not only of the 'L aiser tribe, but of the whole Masai people, is the Eñ gidoñ, because both the family of the chief (ol oiboni) and that of the sorcerer (el goiatek) belong to it. The designation "chief" is actually not quite correct, since the ol oiboni does not rule directly and does not exercise any real executive power. He rules only indirectly: the firm belief of his subjects in his prophetdom and in his supernatural ability of sorcery gives him an influence over the destinies of the people. Despotism and cruelty, such as we find among all Negro rulers, are foreign to him. He is less a ruler than a national saint or a patriarch, in whom the Wakuafi and Asá also see their head. The people speak of his saintly person in timid awe, and no one would

[613] [754] M [829] D [791]

/18 cont./

791 dare to appear unsummoned before the mighty one. Thus, the Masai living on the military station of Moschi /Moshi/ remained hidden during Zendeo's presence when the latter visited it at the beginning of 1896, and my Masai servant did not dare deliver a message either to Zendeo or to an attendant sitting beside him.

The aim of the chief's policy is the unity and strengthening of the Masai. By letting the rapacity of the warriors spend itself [648] in expeditions against foreign tribes, he protects his own people from devastating civil wars for which the endless friction of the districts among themselves would give continuous occasion. This influence makes possible for him the belief that a victory is attainable only through the secret power of the war medicine that he alone knows how to manufacture, and a defeat must inevitably come if he predicts it. Neither he nor his closest relatives go to war. He gives remedies against epidemics and sicknesses -- as a [755] rule in the form /19/ of magic medicines -- and orders supplication [782] feasts in honor of the Masai god 'Ng ai. He reads the prophecies [787] from an oracle game of the kind of the counting off of buttons. From a neat's horn provided with a leather cover (Fig. 1) he takes a handful of river pebbles, puts one or several of them aside, and throws back the rest. After he has repeated this several times, he announces his prophetic verdict, which often enough is worded in Pythian ambiguity. The game, like the lineage, is called en gidon. The office of ol oiboni is hereditary and has been handed down until the most recent times from father to the eldest son of the principal wife. The badge of his office is an iron club.

Fig. 1.

791 The Masai do not know much to say about the genealogical 613 tree of the El oibonok. The first four or five names that it contains 173 belong to chiefs who ruled in early times. These names are: 791 Kidoñoi, Geriga, Bargumbe (Bamjumbe), and Lesigirieschi. The 175 next chiefs are historical and descend from modern times. The first of them, Kibebete, seems to have ruled at the beginning of the nineteenth century; he was followed by his son Sitonik, who

175 791 [765] [232] [173] [787] [648]

/21 cont./

recovery from their pains. Mbatyan eamed outstanding merit through the discovery of a protective vaccination against lung disease of cattle. According to the corresponding accounts of Zendeo and four old Masai, Mbatyan, several years before his death, had already prophesied the appearance of rinderpest that did not take place until after it and the subsequent subduing of the Masai by Europeans. In the outward appearance of this man nothing divulged his power. On a thin, average-sized figure sat an ugly head whose face was disfigured more particularly by the lack of one eye -- allegedly a birth defect. This latter circumstance led to the origin of the legend that the chief must always be one-eyed and that the father should destroy in childhood one eye of the son later following him. The face was even more repulsive because of a scanty, slightly gray full beard. That is, in contrast to the other men, neither the ol oiboni nor the el goiatek and el kiborõn mentioned farther below may pluck out their beards, because they would lose their supernatural power through the removal of the beard hairs. [826] [302]

791 621 [361] [595] [623]

The chief's village consists of a large number of kraals lying close together, several of which serve as the dwelling of the ol oiboni with his numerous wives. Mbatyan had about 200 wives; the still young Zendeo has only 20 of them. No strange man may enter these dwelling kraals of the chief and his wives or appear in their immediate vicinity. Close by are found the rest of the kraals, one of which is intended for conferences and receptions and in which a few older men close to the chief as helpers and advisers (el dunganak oirorie ol oiboni) live with their families, whereas the others are occupied by warriors who form the defense of the village and, on the marches of the chief, his bodyguard. In his last years of life, when Mbatyan was mentally disturbed, he often spent months on the open steppes in a small hut made of branches, around which the warriors accompanying him camped in a large circle. The ceremony in the chief's camp is very simple. One of the men wandering about idly in the village leads the newcomer into the conference kraal, where he waits for the chief. As soon as the latter appears, the stranger

791 576 609

/21 cont./

791 576 609 rises, goes toward him, and, with the customary greeting, extends his hand to him, whereby, not this, but the wrist is grasped. After the concluded discussion, for which there are no particular formalities, he takes his leave with the ordinary farewell.

791 789 [262] In the way of food, the ol oiboni takes only goat liver roasted on the fire, milk, and honey, for, through any other food, "he would suffer the loss of the capacity for prophecy and the preparation of efficacious magic charms." Of these arts very little is [173] supposed to have been handed down to his son Lenana and still less to Zendeo, through which it is all the more explicable that the /22/ Masai today tell of hundreds of different kinds of miracles that Mbatyan allegedly performed. According to them, he could fell large trees by sheer will power, or he had the hut in which he was to be found set afire by his attendant, and, after it had burned down, he appeared, uninjured, out of the ashes.

756 [613] From the En̊ gidon̊ lineage there are further supplied, as has already been mentioned, the sorcerers or medicine men (ol goiatiki, el goiatek), several of whom live in each district. Their office, too, is handed down from father to son, who, however, is usually initiated into the whole secret art only after his marriage. The [789] most important magic charm in the life of the Masai, the war medicine, the ol goiatiki does not know how to make. Rather, one turns to him only in cases of illness of human beings and livestock for which the well-known remedies fail, or which one traces back to the sorcery of evil neighbors, as well as to determine unknown wrongdoers (thieves, murderers, etc.).

613 [776] The lineage of the El kiboron of the El mŭleijan tribe, who, according to the view of all the people, are especially favored by 'Ng ai, the god of the Masai, which has made them primarily the bearers of the religious traditions, require a special discussion.

613 157 Corresponding to their position with 'Ng ai, they are distinguished by a relative peaceableness. The young warriors, to be sure, also set out on raiding expeditions with the other lineages, but they thereby seem to avoid any unnecessary roughness or brutality, in which the others often compete. The passion for disputes, quarrels, and vituperation, a prominent trait in the character of the young

411 /131 cont./ The
[237] beautifully worked scabbard (eṅ djaschúr, ṅ djaschuri [Fig. 31 c and
386 33]) is made from goatskin or neat's hide and dyed with the red juice
[824] of the root of the shrub ol gneriandus l en doje (1):

1. Plumbago ceylonica.

on the back side is found a longitudinal middle seam and on the front side a corresponding longitudinal fold. Twelve centimeters from the upper edge /132/ of the scabbard there sits on the front side an oblong eyelet (ol gŭmĕ, el gumeschi) through which the belt (eṅ gĭmĕtá, ṅ gĭmĕtán [Fig. 33 b]) worn around the hips is
[237] stuck. The latter is made of neat's skin and decorated with several
[53] longitudinal folds. There is a hole (en audoto, n audot) at one end, and at the other one a small leather strap (eṅg ene, ṅg enda). The sword is worn on the right side and drawn with the right hand. Left-handed men wear it on the left side. This carrying method seems
[174] to point to the fact that formerly the people did not carry swords, but daggers, for a sword can be drawn with the right hand better from the left side, whereas a dagger is more quickly ready for a thrust from the right. Moreover, the sword, even today, is also frequently handled like a dagger.

714 According to the tradition of the people, the original Masai
178 shields were very small (shield = ol oño). They had a circular, flat
[173] shape, a round umbo in the center, and a diameter of 30 centimeters. The grip stick was fastened on the back side with small straps, which were drawn through the shield. The very light shield was carried with two fingers at the grip stick. Accordingly, the hollow of the umbo was very small. Gradually the shields became larger, and the reason for this may be sought in the frequent conflicts of the Masai with peoples carrying bows and arrows. Since in its original shape, the shield, with
[237] its enlargement, lost firmness, this was increased in that a wooden frame (ol deretál, el deréta) was sewed around the outer periphery with strips of goat or sheep skin, the shield was bellied out, and, to preserve the longitudinal convexity, two straps (e reacheta)

/299 cont./

000 Among them the boys were clipped (circumc.) at the age of 10-12, the girls at the age of about six (exc. clit.). As bride price the husband paid the father of the bride 40 beehives and 12 pots of honey. After the birth of a child the woman did not leave the hut for five days. On the day of the first walk outside, her head and that of the new born child were shaved.

Several times during the month whole bands of older women and men, laden with honey and clay pots which they made themselves, set out for tribes engaged in agriculture, in order to get vegetable foods in exchange for them.

/300/ Nothing is known to my informants about the significance of the animal figures made out of clay that were seen in their kraals and huts.

They called God Schábischab.

• 173 In contrast to the extensive and firmly established traditions from the remotest past stand the paucity and uncertainty of the information from more recent times. Coherent historical memory does not extend beyond a generation; what lies before that is uncertain. The somewhat certain information tells of war expeditions, livestock epidemics, drought, and similar unimportant events.

173 561 791 Therefore only the series of the age-class associations, which, incidentally, also has gaps and is uncertain, and that of the chiefs are still to be completed:

El diēgi	ol oiboni: Kibebete.
El kisaroni	ol oiboni: Sitonik.
El merischari	ol oiboni: Subet.
El kidotu.	
El duati	ol oiboni: Mbatyan.
El ńiaṅgussi.	
'L aimerr	ol oiboni: Lenana (1).

1. Zendeo only belongs to the age class of the El kipuani, which at the present time is attached to the next older one, the El meruturut, not yet to an ol adji.

/339 cont./

*121 174 most of these peoples were and are themselves Semites or Nigrito-Semites. The differences that we find in the customs and in the law of these two peoples should therefore not be put too much in the foreground.

*121 • 173 174 The situation is different with regard to the early history, the early religious tradition, and everything that is included under the designation religion; for these three things form such a closely knit, homogeneous whole that foreign elements must always remain foreign within it. Now, since we find precisely in this a complete correspondence between the Masai and the Israelites, and even among the already sedentary Israelites still see preserved the customs based on their early history or on their early religious tradition, there follows with compulsory necessity the conclusion that there must have once been a time when the two peoples were one people.

*121 173 The manner in which the schism between the two peoples occurred is reported by the tradition of the Masai, which, on account of its natural simplicity and considering the amazingly accurate preservation, in word and meaning, of the other traditions from primeval times, may probably be regarded as credible throughout, corresponding to the truth.

According to it, as a consequence of epidemics and drought, some of the Masai had become quite poor in livestock, many people had even lost all their livestock and lived as hunters. These impoverished ones, who were called 'L amerak or Ameroi, had to cover part of their subsistence by buying vegetable foods among nearby agriculturalists. They thus became dependent on them and could choose their places of residence scarcely more than a few days' march from them, whereas the still well-to-do Masai wandered from one pasturing place to another with their herds, in accordance with their ancient custom. They remained livestock nomads, while the others gradually had to become agriculturalists. The aforesaid dependence of the nomad on the agriculturalist can, in the natural course of things, only ever be a temporary state and must necessarily lead to the former's learning agriculture, for the independent production of his subsistence is the basic condition for his continuance. Now this further development, however, does not

/339 cont./

#121 173 by any means depend on immediate and permanent sedentation. Rather, the latter presupposes first of all a vital energy such as a /340/ people torn out of its previous circumstances by poverty and distress no longer possesses, and then also an inner urge toward sedentation, arising only in the course of long periods of time through gradually entering into new interests and views, which conquers the inborn, hereditary inclination toward nomadism. Thus, a nomadic people, deprived of its herds, experiences a long stage during which it slowly learns the tilling of the soil and seeks to obtain its customary and indispensable meat diet through hunting. The war and raiding lust inherent in the free nomad, whose goal, war, constitutes for him an economic resource through the livestock herds thus captured, is a factor that delays the attainment of permanent sedentation. For, first of all, ruffians are uncomfortable neighbors whom people prefer to drive farther away, and, second, the booty in livestock prolongs the hybrid existence of the erstwhile herd nomads. The yield of the hunt is another factor with the same effect, which undergoes an intensification if the hunter learned the trade at a time in which he could train himself as a hunter-nomad with the support of well-to-do fellow tribesmen as their escort.

Now the tradition of the Masai relates that with, or, better, beside and in association with, the Ameroi lived tribesmen who were impoverished even earlier and more thoroughly than the former and had already learned how to acquire by stalking the meat food longed for by them. We may therefore expect that they were only able to become sedentary later than the former and that at that time their settling down as agriculturalists still lay far away. Now tradition mentions among them an influential man named Ol eberet. In him [171] I think one may recognize Eber, the ancestor of the Israelites mentioned in 1st Moses /Genesis/ 10, 21 ff., and in the lineage named after him, the El eberet, the Hebrews. I suspect this not only because of the phonetic similarity of the names, but also for two other reasons.

/340 cont./

*121 • 173 Ol eberet became the founder of the lineage of the El eberet, named after him, which already at that time was separated from the Ameroi by its external mode of life and had to become separated even further by its continued development. Through this it is most probable that after the migration of the Masai the meaning of the name as one of many lineages of a people receded and was transformed into the conception of a folk name.

[171] Furthermore the tradition of the Masai reports that their separation from the Ameroi and El eberet remaining behind took place at the time the son of Ol eberet, Gereua, lived, and the Biblical account in 1st Moses /Genesis/ 10, 25 says that at the time of Peleg, son of Eber, the earth was divided, which, translated from the Biblical language and considering the circumstance that the Israelites regarded themselves as the chosen people, beside whom other peoples were inferior, contemptible heathen, could mean nothing other than: at that time a local shift not without significance for the Hebrew people occurred, within the field of vision of the Hebrews, among the peoples close to them.

/341/ Accordingly, I think it may be assumed that to the Amai of the primeval age, as whose direct descendants the present-day Masai regard themselves, belonged the oldest traceable component of the Israelites, who, as a Hebrew people, was originally identical with the lineage of the El eberet.

*121 173 171 173 With regard to the further fate of the El eberet-Hebrews the Masai tradition reports that they found special support by the agricultural people of the El dinet (1)

1. As a parallel to the peaceful, neighborly association in which, according to the tradition of the Masai, the El eberet stood with regard to the El dinet, might be interpreted, in the sense of the meaning El dinet = Hetthiter /Hittite/, the report in Genesis 23, in which it is told how Abraham acquired a burial place for Sarah in the land of the Hetthiter /Hittites/ with whom he was on a friendly basis, and further the passage

/341 cont./

*121
*173
171
173

/footnote 1 continued/ in Genesis 26, 34, which reports that Esau, Abraham's grandson, married two Hetthiter /Hittite/ women, Judith and Basmath /Bashemath/. -- That even at that time it was not always easy for Hebrews to find suitable girls of pure Hebrew extraction for marriage we see from Genesis 27 and 28, where it is reported that Jakob /Jacob/ was induced by his mother, who could not get along with Esau's Hetthitish /Hittite/ wives, to set out for distant Mesopotamia in order to fetch himself a Hebrew wife from there. -- One should also note, in connection with the name El dinet, the name of Jakob's daughter by Rahel /Rachel/, Dinah (Genesis 30, 21). This evidence seems to me of particular significance because it refers to that most ancient time in which the Hebrews were still culture-poor nomads. One may think as he wants to about the historical value of these passages, but among all the details there is one that may be clung to: namely, that these reports are based on the memory of a close contact -- and, to be sure, not a brief one, but of longer duration -- of the Hebrews with the Hetthitern /Hittites/, which took place during a time that lies at the very beginning of Hebrew history, in those epochs in which the first historical moments rose up like islands out of the sea of myths. -- The Masai tradition reports further that the El dinet lived in tembes. This, however, is a hut form very similar to the one that is still customary today in Asia Minor and Syria, that is to say, in the lands once inhabited by Hetthitern

/341 cont./

#121
• 173
[12]
[173]

/footnote 1 continued/ /Hittites/, which even today still shelter the most and purest Hetthiter /Hittite/ descendants.

and lived in their vicinity. From that it is to be concluded with great probability that they adopted some customs from them, and this assumption also seems to confirm the one in the direction of the identity of the El eberet and Hebrews.

Just as the El dinet did not consume blood and let the slaughter animal bleed from the opened neck artery before cutting it up, so also was it forbidden for the Israelites to consume blood, according to 1st Moses /Genesis/ 9, 4; 3rd Moses /Leviticus/ 3, 17; 7, 26-27; 17, 10-14; 19, 26, and 5th Moses /Deuteronomy/ 12, 16, 23, 24; 15, 23, a law which later, as is well known, became elaborated into the slaughter ritual. The passages in 3rd Moses /Leviticus/ 17, 13, and in 5th Moses /Deuteronomy/ 12, 16, 24, and 15, 23, also expressly order that one is to let the blood run out and flow on the ground like water. It is to be mentioned in this connection that the last of these passages comes from the law book that allegedly was found around the year 623 when the temple was being repaired, but in reality had only been written then, for the forming of the first priesthood that had grown on Kanaanitic /Canaanitic/ soil into a priestly rule. The other passages, however, stem from the so-called Priestly Codex, /342/ made by priests who, just like the people for whom it was intended, grew up in exile. If I further add that the quoted passages are the only ones in the entire Pentateuch that deal with the prohibition of the consumption of blood, it is doubtless indeed clear that we are dealing here, not with something originally Hebrew, but with a foreign view and institution. That the prohibition against the consumption of blood could have come to the Hebrews only through the influence of a people practicing agriculture is taught by the fact that, for the herd nomads, the blood of their livestock is a valuable food, which is preferably consumed either alone or as an addition to other foods. Just as among the Semite peoples of interior Africa who have become sedentary -- amid mixture with Negroes -- so also among the Hebrews does the custom of consuming blood as food seem to have been preserved long after they became sedentary.

#121 /342 cont./
173 For otherwise what reason would the lawgivers have had to state that interdict so often and emphatically as the passages quoted above show, at a time when the Israelites had already been sedentary for more than half a millennium?

#121 173 174 We find a further influence in the Israelitish god's name Jahveh /Yahweh/, which may have originated from the 'n jau of the El diest. As is already well known, jau is also the Assyrian form of Jahveh, so that in this we have before us further proof of the reliability of the oral tradition of the Masai. In connection with the etymology of the word jau, it is to be said that, according to the statements of the Masai, their ancient language knew the word hau = great, which still occurs today in the Tatoga speech as 'hau. Though this it is probable that the stem of this word belongs to the original Semitic language and in it has the meaning "great," so that the god's name 'n jau in its feminine form would be translated as "the great one."

Now, according to Hommel (1),

> 1. Prof. Dr. F. Hommel: Die altorientalischen Denkmäler und das alte Testament /The Ancient Oriental Monuments and the Old Testament/. 2nd edition.

Al is the oldest designation of the moon god among the western Semites, whose moon cult was almost monotheism. The, long before Moses introduced the official god's name Jahve, Al and Jau are found as synonymous secondary forms of the name of the supreme god. Just as the god's name of the Masai, Ng Al, shows the feminine form, so Al of the Babylonians was also of the female sex. Moreover, Hommel found an A-u element in Assyrian and Mesopotamian personal names and proved that this name was originally Hau.

#121 174 Let us now turn to the other part of the Masai people, who remained in the original homeland, the Amorei or Amorei. That the Bible also gives information about them we shall be able to assume as probable from the outset, in view of what has been found before. The following seems to me to argue that we may recognize in them the Amorites of the Bible:

1: Hollis G-5 (ca. 1894-1904) 1905
FL12 Masai FL12

PREFACE

THE Masai occupy a considerable part of the large plains which extend from about one degree north of the equator to six degrees south of it, situate in both British and German East Africa. Those living in British territory commonly call themselves Il-Maasae[1], whilst the 'German Masai' are to a large extent known as 'L-Oikop[2] or Il-Lumbwa[3]. In olden days the coast people termed them without discrimination Wa-Masái or Wa-Kwayi[4], names which have been perpetuated by Krapf and others. 101 [131]

Sir H. Johnston states[5], and probably correctly, that the Masai represent an early mixture between the Nilotic negro and the Hamite (Gala-Somali); and that this blend of peoples must have been isolated somewhere in the high mountains or plateaux which lie between the Nile and the Karamojo country. Certain it is that the Latuka, who are supposed to be descendants of the ancestral Masai, and who occupy this country, speak a language that is closely allied to the Masai tongue, and have many customs in common with the Masai. The accounts which have been published of the habits and 174 [144] [197] 114

[1] When spoken rapidly this word is sometimes pronounced Il-Másae (for further particulars see also p. 29, note 4).

[2] 'L-Oikop is believed to signify the possessors of the land. It also means murder (see p. 27, note 3, and p. 311).

[3] Not to be confounded with the so-called Lumbwa (whose real name is Kip-sikisi), a tribe living near the Victoria Nyanza in British East Africa. These Lumbwa or Kip-sikisi are nearly related to the Nandi, and are believed to have migrated from north of Mount Elgon (Hobley, *Eastern Uganda*, p. 10). Lumbwa is a term of contempt, and signifies a pastoral people who have taken to agriculture.

[4] The meaning of Kwayi (*or* Kwapi) in Masai is countries *or* somewhere. Hildebrandt's suggestion (*Zeitschrift für Ethnologie*, 1878, p. 349) that Masaea is derived from the Masai word 'masaa, property, and that Kwayi is a corruption of kafi, the Swahili for paddle (given in allusion to their broad-bladed spears), is probably incorrect.

[5] *The Uganda Protectorate*, vol. ii, p. 796.

FL12 Masai FL12

INTRODUCTION

THE present work, by Mr. Hollis, Chief Secretary to the Administration of the East Africa Protectorate, treats of the language, traditions, and customs of the Masai, one of the most interesting and important tribes of those territories. I am not competent—and there must be few people in the world who are—to criticize by the light of independent knowledge the mass of material which he has brought together, and will merely attempt briefly to summarize the information about the race which we now possess. Mr. Hollis's previous contributions to anthropology, his opportunities for studying and daily conversing with the Masai, and his linguistic talents, which are well known to every one in East Africa, are a sufficient guarantee for the thoroughness and excellence of his work. 114

The Masai at present inhabit the inland districts of British and German East Africa from the equator to about 6° S. Few of them are found north of the Line, except an isolated settlement just south of Lake Rudolf, and they seem to avoid both the sea and the great central lakes. Many smaller pieces of water, such as Lakes Naivasha and Nakuru, are found in their haunts, but they neither use boats nor catch fish. They are divided at present into two sections, one of which, called 'L-Oikop, is agricultural and settled, while the other, or Masai proper, is entirely pastoral and nomadic. The difference between the two is evidently not ancient, for both speak practically the same language, and it is probable that the agriculturalists of the present time are nomads who have settled down. On the other hand, tradition does not carry the history of the tribe further back than a century at the most[1], and it would be rash to assume that the nomad pastoral state is primitive or very ancient. It is quite probable that there was a large agricultural settlement on the Uasin-Gishu plateau from which the more adventurous warriors detached themselves. 101 13 [501] [226] 101 [197] 173 174

In East Africa the Masai are clearly distinguished by their language, customs, and appearance from the Bantu races (although the latter often imitate them, and have received a certain proportion of Masai blood), and equally clearly 101 144

[1] The genealogy of the medicine men goes back about 200 years.

1: Hollis G-5 (ca. 1894-1904) 1905
FL12 Masai FL12

101 related to the Suk-Turkana and Nandi-Lumbwa[1]. Somewhat
144 more distantly allied to the same stock are the inhabitants of South Kavirondo or Ja-luo. These races again show clear resemblances to some of the peoples who inhabit the banks of the Southern Nile, such as the Acholi, Bari, Latuka, Dinka, and Shilluk. The whole group are sometimes classed together as Nilotic, and have many peculiarities in common. Their
[197] languages show a considerable, though varying, degree of affinity; physically they are tall, thin men, with features
[142] which are not markedly negroid, and are sometimes almost Caucasian: several remarkable customs, such as the nudity of
[516] the male sex and the habit of resting standing on one leg, are found among them all. The closest connexion seems to be between the Acholi and the Ja-luo, and between the Masai, Latuka, and Bari. The Masai, Nandi, Lumbwa, Suk, and Turkana all possess in a more or less developed form a military organization which obliges all the male population, between the ages of about seventeen and thirty, to submit to a special discipline and constitute a warrior class. A similar organization does not seem to be recorded among the tribes who dwell along the Nile[2]. These latter are not a homogeneous group, so that the word Nilotic must be used with caution. The Madi, who occupy a large portion of the country between Lake Albert and Gondokoro and extend well to the east of the river, are linguistically different from their neighbours, and apparently represent an invasion from the west, though in customs they do not seem to differ markedly from the Bari.

174 A glance at the map will show that from the Rift Valley to
197 the Nile there runs in a north-westerly direction a broad belt of non-Bantu languages, more or less allied to one another, Masai, Nandi, Suk, Turkana, Karamojo, Latuka, Bari, and Dinka. The Karamojo appear to be Bantus who have been forced to accept an alien form of speech. This distribution of languages seems clearly to suggest a south-eastward movement from the country between the north of Lake Rudolf and
174 the Nile. The hypothesis is rendered more probable by the fact that in East Africa as elsewhere the course of invasions has been mainly from the north to the south. This is certainly

[1] The name Lumbwa is confusing. It is really a term of opprobrium applied by the nomadic warriors to agriculturalists of their own or allied races (not, apparently, to Bantus). Hence the 'L-Oikop are often called Lumbwa Masai. But the name is popularly and officially applied to a tribe closely allied to the Nandi who live to the south of the Nyando valley.

[2] Baker perhaps alludes to something similar among the Latuka whose young men, he says, live for fighting only.

1: Hollis G-5 (ca. 1894-1904) 1905
FL12 Masai FL12

the case with the Gallas, Somalis, and Abyssinians (who are rapidly encroaching on the Protectorate), and probably with the Bahima. It also seems probable that the physical type of these races (Masai, Nandi, Turkana, Dinka, &c.) represents a mixture between the negro and some other factor. It does not seem to me possible to make any definite statement as to what that factor may be, but the neighbourhood of Egypt and Abyssinia renders several hypotheses plausible. Baker states that the appearance of the Latuka (who are probably the closest allies of the Masai) points to a Galla origin, and that there are Gallas on the east bank of the river Chol only fifty miles east of Latuka, which they have often invaded. It may therefore be that the Nilotic tribes, and possibly also the Hausas to the west, represent a hybrid of the negro and Galla. 174

There is absolutely nothing to show when the Masai moved southwards, but the traditions reported by Mr. Hollis (p. 264, &c.) seem to place the earliest history of the world in an East African setting, and convey no hint of an earlier home. The chief characters in these stories are the Masai, the Dorobo (hunting tribes), and the Bantu (Meek), and the principal event some arrangement by which the Masai obtain a right to all the cattle in the world. This seems to indicate that they must have been a long time in their present haunts, and have lost all remembrance of their origin. Some of the proverbs, such as 'The zebra cannot change his stripes,' and 'Mountain does not meet mountain,' have a familiar oriental ring; but it would be unsafe to speculate how they came to Masailand. 174 173 [539]

A very different view of the past of the Masai is suggested by Merker's recent work (*Die Masai*, Berlin, 1904). He regards them as belonging to the same stock as the ancient Hebrews, and quotes a great number of traditions respecting the creation, deluge, ten commandments, &c. which resemble the Biblical and Babylonian versions of primitive history. A critical examination of these stories is very desirable, as one cannot help suspecting that they contain elements borrowed from Christian or Mohammedan sources. On the other hand, in all questions affecting the origin of East African races, our only data are the most recent types of physique, religion, and language, and we cannot, as in the case of more civilized nations, go back two or three thousand years with comparative certainty. We can form no idea of how many strata of population such a period would represent in Africa; what mixtures and disruptions of races it would include. 174 114 174

1: Hollis G-5 (ca. 1894-1904) 1905
FL12 Masai FL12

174 A tribe coming from the north like the Masai, and possibly at one time in touch with races influenced by ancient Egypt, may conceivably represent not an improvement of the primaeval African stock but a degeneration of some other race. Still, the accounts which we have of the Bari and Dinka ascribe to them the same vague belief in a supernatural power, which most inquirers have reported as existing among the Masai, and an absence of traditions respecting the origin of the human race[1].

175 648 The history of the Masai, as far as we know it for the last hundred years, presents as its most important feature a conflict between the pastoral and agricultural sections, ending in the victory of the former and the annihilation of large settlements of the latter. The conflict was disastrous for the race, for the portion which survived depended entirely on cattle and raiding for subsistence. The herds suffered severely from plague in the eighties, and the advent of Europeans and the gradual introduction of the Pax Britannica could not be otherwise than unfavourable to the pre-eminence of a tribe whose prosperity depended so largely on continually plundering their neighbours. Nevertheless from at least 1850 to the early eighties the pastoral Masai were a formidable power in East Africa. They successfully asserted themselves against the Arab slave-traders, took tribute from all who passed through their country, and treated other races, whether African or not, with the greatest arrogance. About 1859 they raided Vanga, on the coast near the present German frontier. Thomson (*Through Masai Land*, 1885) describes how, in 1883, they entered his camp and ordered about the whole caravan, including himself, as if they had been masters and the travellers slaves. This period of triumph was succeeded by [731] one of disaster. Rinderpest attacked the cattle and small-pox [164] human beings. The surrounding tribes who had suffered from their raids were not slow to revenge themselves for the oppression and plunder of the past, and a severe famine completed the catalogue of misfortunes. The numbers of the 16 Masai were undoubtedly greatly reduced, and at present those 175 found in British East Africa only amount to a very modest figure, variously estimated at from 25,000 to 12,500. The latter estimate, which is the latest and perhaps the most correct, is based on the assumption that there are 7,500 in the

[1] See Mitterrutzner, *Die Dinka Sprache*, 1866, p. 56, &c. It is true that some expressions ascribed to the Dinka, such as 'We do not know—the wise men know,' might be interpreted as a consciousness of the loss of traditions.

Shaving.

Masai elders, women[1], and children shave their heads and eyebrows, and pull out their eyelashes if they enter their eyes.

They also pull out or shave the hairs of the beard, armpits, and pubes, and some singe the hairs of their shins.

If warriors are not in mourning[2], they may not shave their heads until they have held the feast called e-unoto[3], and they grow pigtails.

When a woman gives birth to a child, neither she nor the child are shaved until the latter has four

[113] [171] [174] Sir H. Johnston, in commenting upon this, says (*The Uganda Protectorate*, p. 803): 'It may be this explanation has been invented recently to explain a very ancient custom inherited by the Masai from the Nilotic stock, which was their origin; for amongst these people the removal of the lower incisor teeth is a very common practice.' Hinde's explanation, however, appears to be very widely spread.

[171] [1] This very uncommon practice for women to shave their heads is also followed by the Dinkas, Baria, and Latukas (Cummins, 'Sub-Tribes of the Bahr-el-Ghazal Dinkas,' *Journal of the Anthropological Institute*, June, 1904; and Baker, *The Albert Nyanza*, p. 90, &c.).

173 **Origin of the Masai.**

Little is known of the early history of the Masai tribe, but it seems to be an established fact that the original home of this people was the country between the north of Lake Rudolf and the Nile, from which area the Masai are said to have moved in a south-easterly direction so long ago that tradition does not recall any incidents of the exodus, nor the reason therefor.

101 173 **Pastoral and agricultural sections.**

It seems, also, that there were two distinct sections of the Masai, distinct in point of habits of life and customs, though not of language or ancestry, between which sections continual war was waged, wars which now form the greater part of the traditional history of the tribe as it is known at the present day to its members. The sections are usually defined as the agricultural and pastoral sections, the former, known as 'L-Oikop, being more or less settled, while the latter was entirely nomadic, and never practised agriculture in any form. Masai tradition does not extend back for more than one hundred years, but the history of that century shows, to the exclusion of all other topics, a conflict between these two sections, which resulted in the practical annihilation of the 'L-Oikop, who have now ceased to exist, with the exception of small settlements found at Nguruman, to the north of Lake Natron, two villages, Great and Little Njempa, to the south of Lake Baringo, possibly the so-called Uasin Gishu Masai, now located near Eldama Ravine, and in Kavirondo country, and certain individual settlements of Masai among neighbouring tribes, where they have assimilated the customs and adopted the language of their protectors, and from whom it is now difficult to distinguish them.

[361]

Settlements of 'L-Oikop.

174 114 **Sir Charles Eliot's theory.**

The theory suggested by Sir Charles Eliot, is that the nomad pastoral state cannot be assumed to be primitive or very ancient, and that it is quite probable that there was a large agricultural settlement on the Uasin Gishu plateau, from which the more adventurous of the warriors detached themselves.

177 **European influence.**

It is this conflict which made the Masai name what it was and which has rendered so complex the question of the administration of the conquering pastoral section. The victors depended entirely on cattle for their means of subsistence, and were driven to raiding other tribes, in order to amass sufficient herds of cattle. The introduction of the European element, therefore, deprived the Masai of their one pursuit, and had the inevitable result of reducing the Masai from the first to a very low rank of economic importance among East African tribes.

[721]

101 **Wakwavi.**

The term Wakwavi (Wakuafi of Krapf) is frequently used by the early writers in reference to the Masai, but it appears that this term has, in fact, no connection with the agricultural section, being merely a Swahili nickname borrowed from the Masai Kwavi or Kwapi, meaning places.

6: Thomson K-3 (1883-1884)1887
FL12 Masai FL12

614 breed than others. The most aristocratic of these clans are
565 the Ngajè-Masai, Molilian, Lyserè, and Leteyo. These have the finest physical development, and are undoubtedly superior
142 to the others in the shape of the head, the less depressed nose, and thinner lips. Indeed,—but for the prominence of the cheek-bones, a tendency to a Mongolian shape and upward slant of the eyes, the chocolate-coloured skin, and the hair with a tendency to become frizzy—they might pass muster as very respectable and commonplace Europeans. The Ngajè-Masai are the purest breed, and are to be found chiefly around Kilimanjaro. The most degraded tribe physically is that which is known to the coast traders by the name of Wa-kwafi. They seem to have acquired a strain of negro blood, as will be perceived by an examination of the photograph of the Masai of Lykipia (p. 205).[1] The higher development of the Ngajè-Masai is seen in the photo of an aristocratic woman of Njiri.

634 The country is divided into about ten principal districts, such as Sigirari, Njiri, Matumbato, Kaptè, Dogilani, Lykipia, Guas' Ngishu, &c. The various members of the race are
[614] generally designated by their native district. Various clans may be found occupying the same district, but they usually keep in distinct kraals. Hence they speak of the "El-Masai Matumbato," or El-Masai Kaptè. Each district also is fur-
[714] ther distinguished by having special heraldic devices on the
[531] shields of the warriors, painted with wonderful skill and taste in black, white, red, or yellow colours. Between the
619 various sections of the tribe there is not the slightest cohesion.
628 Wars among themselves are of constant occurrence, though when a state of war is not declared, they are on the most friendly terms,—their feuds not being of that deep-seated character which distinguishes those of semi-civilized lands.

●174 Of these internal wars none have been so disastrous or so
628 oft-repeated as that between the main mass of the Masai and the Wa-kwafi (I here use the name for convenience). The original home of the latter was the large district lying between Kilimanjaro, Ugono, and Parè on the west, and Teita and U-sambara on the east. This large region is known to the Masai as Mbaravui. Some fifty years ago the Wa-kwafi were numerous and strong, able to hold their own against all comers. About 1830—as far as I can gather—a series of misfortunes fell upon them. In a great war-raid against the Wa-gogo to the south they suffered a severe repulse, and great numbers were slaughtered. The same

[1] [Not processed.—Analyst]

6:Thomson K-3 (1883-1884)1887
FL12 Masai FL12

179
628

disaster fell upon them shortly after, in a raid against their brethren of Kisongo. The saying that misfortunes never come singly was well exemplified by their case, for nature took up the work of ruin. A cloud of locusts settled on the land, and left not a blade of grass or other green thing, so that the cattle died in enormous numbers through starvation.

[142]
291
[301]

MASAI MARRIED WOMAN, NJIRI.

While the Wa-kwafi were in this unhappy plight, the Masai of the plains to the west fell upon them and smote them hip and thigh, and thus broke up and revenged themselves upon the most powerful division of the tribe. Great numbers having lost their cattle and been reduced to starvation, were compelled to throw in their fortunes with tribes they had hitherto despised. Some found an asylum in the forests of Taveta and Kahè, and the lower slopes of Mount Meru or

174
166

6:Thomson K-3 (1883-1884)1887
FL12 Masai FL12
Wa-Kwafi

174 Arusha-wa-jūū. Others, driven south, threw in their lot
166 with the Wa-zeguha, keeping tribally more or less distinct
from them. These are the hybrid tribes visited lately by
[797] the energetic missionaries, Messrs. Last and Baxter, and of
which such interesting accounts have been given in the
"Proceedings of the Royal Geographical Society." Another
section of the Wa-kwafi was driven westward, and now
forms the colonies of Nderserria-ni and Nguruma-ni. The
establishment of these colonies has been an unmitigated
blessing to the country. In every case they have become
the centres of trade, where men's lives and gooods are safe;
and indeed there is no more striking feature in the results of
the enforced change in the people's mode of life than the
remarkable development of peaceable habits and honest
ways. This shows what the Masai, from their distinctly
higher mental development, are capable of, when cut away
from their traditions and brought under conditions more
favourable to their advancement towards civilization. As
throwing light on the origin of minor races and the blending
of two distinct types as at Taveta, the subject is an interest-
ing study.

The Wa-kwafi were not all scattered thus, however, for a
large division of the clan kept together, and contrived to cut
their way through Kikuyu and to reach Lykipia, where they
settled.

175 Another section crossed the meridional trough and reached
the opposite half of the plateau in Guas' Ngishu. In both
726 districts they found superb grazing-grounds and plenty of
628 elbow-room, and there for a time they remained quietly, and
increased rapidly in numbers. At last their wars began
again. Grown bold, they attacked the Masai about fifteen
years ago. The opposing parties formed regular camps, and
fought pitched battles with great fury, thousands being
killed on both sides. The women stood by and watched,
while they incited and urged on the combatants in their
terrible hand-to-hand encounters. The Masai were at first
beaten, but, fighting with the stubbornness of despair, they
disputed every foot of ground. They were driven from the
whole of Naivasha and Kinangop, and their enemies, still
victorious, carried the war into Kaptè. Matters now changed,
however. The Masai of the entire region to the south
gathered together and came to the assistance of their brethren
of Kaptè. Soon the tables were turned, and the Wa-kwafi
were gradually forced back. The great majority of them

000 Mbugwe are Bantu. There is also a small group of Tindiga, leading virtually a bushman life in the Lake Eyasi basin, to whom reference was made in Section I.[1] There would appear to have been a movement both northward and southward on the part of the tribes, who were previously contained in a very small area by the Masai invasion of the early part of the century.

THE MASAI DISTRICT

131 The Masai District forms the southern portion of the large block of country
161 in Tanganyika and Kenya, extending to no less than 21½ million acres in extent, occupied by the Masai tribe, whose numbers were given in the 1931 Census as 48,945 in Kenya and as 47,276 in the 1948 Census in Tanganyika. There will be found in the Chapter dealing with Kenya Colony further reference to the tribal characteristics of the Masai, and it will be sufficient to give here only those facts which bear in particular on the position they occupy in Tanganyika.[2]

174 The southern movement of this tribe from the neighbourhood of Lake Rudolf seems to have come to an end about the middle of last century, but its spearheads had in 1830 penetrated as far south as the Great Ruaha River and even to Uhehe in the Iringa District, whence they were driven back by the Gogo and Hehe. There were many isolated Masai raids after that time, but these were in the main carried out by Kenya Masai, whose incursions were directed towards the coastal areas on the east, and indeed took them on occasion as far as Mombasa. The Masai settled in Tanganyika do not seem to have attempted a further movement of any importance into the neighbouring areas of the Territory.

175 The Anglo-German Agreement of 1890 cut the Masai country into two
101 parts, roughly equal in area, though the population remaining under the British jurisdiction was somewhat larger than that which fell under German rule. The result was to make an effective division between the Kenya and Tanganyika Masai, and though the two sections have retained a community of racial interest, this has not extended to the political field. Such political unity as the Masai people possessed had existed largely for war puposes, and in peace time political as apart from religious authority was dispersed among the headmen exercising control over the groups having a customary right of pasturage in particular localities. There was moreover lacking in the case of the Tanganyika Masai a motive which might have led them to identify themselves with the Kenya Masai, namely, the need for protecting their lands from alienation by Government for the benefit of Europeans. The troubles created in Kenya by the
[648] efforts of Europeans to secure possession of Masai lands[3] were not repeated in Tanganyika, where the Masai have remained undisturbed in the occupation of the country they held at the period when European rule was established.

131 The present Masai District comprises, in the north, the Loliondo area, the
133 dominant feature of which is the vast Serengeti plain, with the extinct volcanoes which mark its southern end. In the centre, south of the Rift Wall, the plateau
[312] type of country is characterized by volcanic hill masses, which provide a number of permanent water sources. In the South lie extensive thorn scrub steppes, with a low and very variable rainfall.

311 Practically the whole of the area included in the District is used only for
101 pastoral puposes. If tradition is correct in holding that the tribe was once
173

Kisonko

126 of ceremonial dances taken during the Jubilee Celebrations of King George V in 1935, and of water drawing from the deep pre-historic wells of Central Masailand.

104 A word about Masai terms; throughout clarity rather than pedantic accuracy has been the aim. Thus the anglicized "Laibon" has been used for *ol Oiboni*, "Unoto" for *e Unoto*, "Laiser" for *'l Aiser*, etc., i.e. the article has been retained or dropped as the occasion demands. Where the plural forms have become current in local administrative usage, e.g. Laigwanak, they have been retained, but in other cases their employment would merely have led to confusion. When anglicized or in common use, these terms have been left in standard print: when italicized the word or phrase is, as far as known, grammatically correct.

113 Finally, it was thought undesirable to burden the report with frequent references and footnotes. A list of the works consulted is appended.

SECTION I. — HISTORY.

A. **Early History: the Exodus — origin of the Laibonok — southward penetration — consolidation in Tanganyika under Subet — origin of the Lumbwa or Kwavi — limit of expansion — dispossessed tribes — archaeological evidence.**

174 The Masai are generally regarded as coming from Nilo-Hamitic stock. From the known history of other tribes, and a comparison of various cultures with that of the Masai, it is believed that, some four hundred

• Fully illustrated.

9:Fosbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

years ago, the latter were located in the area lying to the north and 174
west of Lake Rudolph.

The Masai themselves carry their history back to a time when they 173
lived in a lowland called Kieru; this cannot be other than the desert region lying between Lake Rudolph and the Kenya Highlands. The following is the story of their exodus from that area.

An elder, Maasinda, constructed a ladder or staircase up the scarp, which, till then, had prevented the Masai from moving south; on the plateau beyond he found good grazing and water. He consequently arranged to migrate, and he and his six sons, followed by the Laikipiak and the Kwavi, successfully negotiated the climb with all their cattle and possessions. The remaining Masai, who had previously been instructed to follow in an agreed order, then rushed the ladder, which broke under them. They were thus unable to follow.

The scarp is named Endigirr oo Namuga (the scarp of the sandals) and the country at the top Olkeju lol dugha (the river of palms). At this latter place Maasinda met with the Laitayok, the Uasingishu and Siria Masai, and the Kipsikis (Lumbwa).

Maasinda has become the culture hero of the Masai, to whom numerous 173
legends have been attached. In one it is alleged that a woman, Naiterokop, 173
came down from Heaven and bore two sons, Maasinda and ol Meek, this being the origin of the Masai and the Bantu. Maasinda is believed to have ordered the Masai to live at peace with their neighbours and, in the event of war, never to kill women or children. The invention of branding cattle as a means of identification is also attributed to him.

His six sons are also alleged to have been the founders of the existing [614]
Masai clans, Morungiro being the founder of the Laiser, Lolkesen of the Mokasen, Lesita of the Mamasita, Lelyan of the Molelyan, and Lesero of the Tarosero. The name of the founder of the Lughumae is not recorded.

The next event in tribal history is the acquisition by the Masai of the Medicine Man or Laibonok. The legend of the members of the Laiser clan finding a heaven-born child on Ngong Mountain is recorded by Hollis, 174
who also gives a genealogy in which Lenana's name is the ninth. If thirty 173
years is allowed for each generation (possibly an underestimate, since primogeniture is not the rule of succession), the first laibon must have been found about the year 1640. This agrees with all my informants, who state that this event took place prior to the earliest remembered age grade, i.e. before the beginning of the eighteenth century.

From the fact that the finding of the laibon took place at Ngong, it may be presumed that the period from the exodus to this event was one of slow penetration southward through the Kenya Highlands.

Contrary to the evidence previously recorded, it appears that the 173
advance guard of the Masai had penetrated as far south as Usagara (Mpwapwa District) and made contact with the Hehe by the beginning of the nineteenth century. The story is that when the Merishari were reaching the age of circumcision, two big bomas penetrated into Gogo country to a place called Muli (Masai) or Lodi (Gogo) in search of grass. The leaders of the movement were two uncircumcised youths. One of

9:Fosbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

173 the bomas subsequently returned north, the other went as far south as Usagara. Laibon Subet sent instructions to this boma to return, but they disobeyed his order so were brought back by force. The descendants of the members of this boma are to-day known as il Muli.

The first half of the nineteenth century was a period of consolidation in the area now known as Tanganyika. To nearly every area of the Masai District there is attached a legend of how, and by and from whom it was conquered; examples of these are quoted below.

The Lake Manyara area was in the old days inhabited by a pastoral tribe known to the Masai as il Adoru. From descriptions it would appear that this tribe was one of the branches of the Tatog group, possibly the Barabaig. The moran of the Merishari age had a pitched battle on one side of a rain pond or lake, now known as Balbal lol Merishari, and there defeated one half of the Adoru warriors. The remainder stood drawn up on the far side of the lake and urged the Masai to attack. The latter consequently waded into the lake until the water reached their necks, but were unable to cross. They were thus left floundering whilst the balance of the Adoru made good their escape.

The Kidotu age was responsible for the capture of the Naberera wells from the Lumbwa or Kwavi. The Lumbwa made their escape whilst each Masai was engaged in pegging out a claim to the captured wells. The Lumbwa laibon, father of the present one, closed the pass to the west of Naberera, Engamata o ndareta, by magical means, which prevented pursuit by the Masai. It is alleged that, to the present day, no Masai will pass the spot where the medicine was placed without throwing a stone on to a cairn which has thus grown up there.

A third story also concerns the Lumbwa, this time those of Sanya. Two Lumbwa manyattas, known as Sabuki and Sitet, fled before the onslaught of the earlier Dwati moran, and following down the Ruvu valley, then cut across country and inhabited an area near Kilosa known as Kilena. Here they fought with the local inhabitants; the Sabuki, being beaten, retreated back to Nguu country. The Sitet, however, penetrated southward, where they found a large crater similar to Ngorongoro. They closed the pass by which they had entered the crater with stones and wild fig trees, and there lived at peace till a German was led to the place by a dog.

173 It is as well at this point to examine the origins of these Lumbwa or Kwavi. The Masai regard themselves as having a common origin with 174 the Lumbwa, and consider that only recently have the latter diverged 114 from Masai ways and taken to agriculture. As evidence the Masai cite physical appearance, common language and customs, and historical data. On the other hand, Elliot in the introduction to Hollis talks of the agricultural and pastoral sections and says that "it would be rash to assume that the nomad pastoral state is primitive or very ancient." Hollis states that "the Coast people termed them without discrimination Wa-Masai or Wa-Kwavi, names which have been perpetuated by Krapf and others." It would appear that this lack of discrimination was due to the fact that at the time when Krapf was writing (circ. 1850) the Masai

9:Fosbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

and Lumbwa were indistinguishable, merely two sub-tribes of a pastoral tribe, indulging in civil war; c.f. Krapf—"the two kindred tribes the Wakuafi and the Masai hate each other mortally, which is, however, a fortunate circumstance for the weaker African tribes"; Thomson also regards the Masai and Kwavi as two sections of the same pastoral tribe, and records in detail the ascendancy of the former. As he was writing fifty years ago, when all phases of the civil war were well within living memory, his account may certainly be accepted as correct. Elliot's suggestion that the nomads are offshoots from an agricultural Masai tribe is also discounted by legends recorded since he wrote, notably that of the exodus. 173 174 114

The first part of this section, dealing with events occurring prior to those within living memory, may well be closed with a review of the state of affairs circa 1869, a survey of the tribes dispossessed by the Masai, and an examination of any evidence throwing light on the era prior to Masai invasion. Subet, who died about 1860, was settled at Lashaine, below the present District Office at Mondul, with Rasharasha as his main water. He was surrounded by members of the Engidong clan at Musa, Engare ol Motonyi and Olgeju Lolera. The Arusha were established on the slopes of Mount Meru, and the Masai effectively occupied an area corresponding closely to their present boundaries. They had suffered a severe famine about 1830, but owing to the warlike efforts of the first Dwati age the country was by this time fully restocked. The Nyangusi, a few of whom are alive to-day (1939), were carrying on border wars with the Nguu, Gogo and Mbulu tribes, and it is doubtful whether Karatu, Talamai or Kiteto were as yet in Masai hands. On the other hand, they at this time possessed areas now lost to them, as for example the country between the east bank of the Ruvu and the Pare Hills, extending as far south as Bwiko; the alienated and reserved areas around Kilimanjaro, Meru and Mondul; and the country between the Naberera-Kibaya road and the Kondoa Hills, now lost to "fly". 175

To the west of, and also immediately below the Rift Wall, the country was probably inhabited by at least three tribes. the il Datwa lol Orokishu (Mbulu ?), the il Datwa lol Kuroto (Mbugwe ?) and the Sonjo. It seems likely that at any rate some of these tribes practised agriculture under irrigation, but that they possessed cattle also is almost certain. The Manyara area, as shown above, was in possession of the Adoru, a pastoral tribe, whilst the Mondul, Mweandet, Engare Nanyuki and Simanjiro areas were occupied by the Iligolala, again pastoralists, said to have been akin to the Masai.

Further south, Masai tradition of previous habitation, except by the various tribes of Dorobo, is lacking, owing to the fact that the Lumbwa and not the Masai evicted the previous occupants, if any. It is possible that the Nguu and Burungi tribes extended slightly farther to the north than they do at present, but existing climatic conditions indicate that, at most, these people have lost no more than a few border waters to the Masai.

9:Fosbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

174 It is impossible here to digress at length into the realms of pure archaeology, with reference to the Olduwai man, obsidian flakes, etc., but 172 any evidence which throws light on the type of life that the country supported prior to Masai occupation is of interest in relation to the type of culture which the Masai may be expected to attain.

Briefly, then, the evidence shows that immediately below the Rift Wall cultivation under irrigation was practised, and that east of the Rift the country had at one time been inhabited by a tribe fully acquainted with the arts of well-digging and dam-building. These people may have practised agriculture, but there is no evidence to show that they did; their water conservation measures certainly show them as being cattle keepers, since no agricultural community, drawing domestic water only, would sink 50 or 60 wells in one small area, as at Naberera. That a cattle owning community requires such numbers is obvious from the fact that the Masai use nearly every prehistoric well, and have opened many new ones in addition. These same people were possibly responsible for the dams on the south-east flank of Monduli mountain, and perhaps they constructed the irrigation system which the Chagga are alleged to have found on Kilimanjaro.

But the people who dug the Naberera, Makami, Ndedo, Ngasumet and Londergess wells were most certainly pure pastoralists, and were probably responsible for the construction of the rain ponds in this area. A rain pond, liable to dry up, is obviously as useless to a settled agricultural population, as a group of twenty or thirty wells in a confined area. But to a pastoral people two such sources of water in conjunction enable an otherwise inhospitable country to carry a large cattle population.

The only available evidence of settled habitation in the southern area is found near Makami and Londergess. In concentrated areas, one at each of these places, are to be found numerous large kitchen middens, composed of ash and refuse, and containing numerous pot-sherds, bones, and — most important of all — the clay mouths of native bellows, and the clinkers formed when iron ore is smelted.

Thus, throughout the whole of Masai District, the only signs of settlement are associated either with agriculture under irrigation, or with metal work. The rest of the evidence points to the fact that the country was inhabited by nomadic pastoralists. For this reason any other mode of living cannot be expected from the Masai unless by the provision of water a radical change is made in the environment.

B. Sub-tribes and Sections: Sub-tribes — Sections — Kenya Sections — Sections common to Kenya and Tanganyika — Laitayok, clan or section? — Salei — Serenget — Engaruka — Kissongo — Kiteto — Molbo.

619 The early history of the tribe has been summarized above; before turning to recent history, i.e. events occurring within living memory, it is necessary to define the sub-tribes and sections of the Masai, as a record of recent events is mainly a chronicle of civil war and strife between such units.

9:Fosbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

634 they were found in 1928 by the Sonjo Patrol, and allowed to stay on in terms of the agreement made with the "Kenya Masai."

The other two sections included in the terms of this agreement, the Loita and Laitayok, were not in fact Kenya Masai at all. For a division of the Loita, called il Ndasagera, had inhabited the highland area round Loliondo, as far south as Lemunyani, since the Masai took possession of the country. The history of this section is bound up with that of Sendeyo, and is recorded below.

Likewise a division of the Laitayok possessed ancestral grazing grounds to the west of the area inhabited by the Loita, which, like those of the latter, were bisected by the inter-territorial boundary.

There are numerous other Masai found in many sections who call themselves Laitayok, and it is difficult to decide whether the name applies 174 to a clan or to a section. From the recorded legend (see Early History) 565 it would appear that they were not amongst the Masai who took part in the exodus, and even to-day a certain stigma attaches to them. When 634 inhabiting the country of another section they usually dwell apart, as for example, amongst the Laitokitok or at Engasumet; Ngongongare on south-east Meru mountain is also regarded as a traditional Laitayok area. Frequently the name il Mingana is used to distinguish the Laitayok from the "pure" Masai.

The probable explanation of their status is that they do in fact belong to a lower stratum; in some areas they have been absorbed by the section amongst whom they resided, and thus eventually came to be regarded as a *clan;* in other areas they were sufficiently numerous to enable them to retain their own grazing grounds, and to justify their holding tribal 634 ceremonies of their own. An example of the latter is the Loliondo group, who are rightly regarded as forming a separate *section;* or again the il Dala Lekutuk is reputed to be a section composed entirely of Laitayok.

Another section divided by the border is the Salei or Saleh who now inhabit the area immediately west of the Rift, from the Loita to the Ngorongoro Highlands. They are reputed to have been in the past an important and numerous section, with the true Salei living on the Sanjan Plain (known to the Masai as Salei, the Sanjan is a river) and various sub-sections; the il Merik at ol Donyo Gol, il Bokai on the Osopuku lol Datwa, and il Ngorongoro in the place which their name signifies. Apparently they, together with the Serenget, acknowledged Mako, brother of Mbatian, as Laibon. They are recorded in the "Administrative History" as following Sendeyo; their present nominal allegiance to Mondul is probably due to the conscious efforts of the administration to bring all the Loliondo Masai into the Kissongo fold.

The Serenget, as their name implies, live on the plains to the west of Ngorongoro, from Lake Eyasi to Engare Nanyuki. They were dispersed by famine and Loita invasion between 1890 and 1900, and only reassembled during the post-war period. The strength of their allegiance to Mondul is also very doubtful.

The Engaruka are a section who perhaps took their name from having maintained themselves through the famine of 1890 by cultivation at

9:Fosbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

One is frequently told by elders that in the old days the laibon concerned himself primarily with the moran, giving them war charms, supervising their ceremonies, etc., his payment consisting of a share in the spoils of war. After the Unoto or promotion ceremony it appears that a special raid was undertaken, called *enoondorosi*, a portion of the produce of this doubtless being handed to the laibon. I should think, however, that the custom of collecting cattle by general levy on the Age, at some time after the ngeherr or 'passing-out' ceremony, is old established. When such cattle are presented to the laibon, it appears customary for him to decree a ceremony, and to supply charms for it free of charge. This, according to some elders, was the last official connection between the laibon and the age as a whole, except of course his natural association with the il *piron* elders concerning the initiation of a new age. Other dealings with him by the elders were in the nature of private practice. 561 791

Before concluding the reconstruction of a laibon's functions in the old days, reference may be made to certain *administrative actions* alleged to have been taken by certain past Laibonok. For instance Subet (7) is alleged to have recalled a section of the Masai who had penetrated far into Gogo country (see Sec. I), and when they refused to obey him, sent a body of moran to compel them to return. Again he is credited with transplanting some families of an agricultural tribe, il Kikoin, from Arusha Chini to the slopes of Mount Meru, to grow his tobacco, and to dig water furrows, notably the Engare ol Motonyi and the Engare Nanyuki; these agriculturists subsequently developed into the Arusha tribe. Mbatian (9), apart from his civil war activities, took such 'administrative action' as telling the Masai not to move at the time of the famine — in fact imposing a quarantine — and ordering the tribe not to resist the Europeans. 174 791

But it frequently happens that past events become linked with the names of important personages of the time, when in fact there was no connection between the two. This may have occurred at least in the case of those actions recorded above attributed to Subet. But even if this is not so, the few instances of executive acts undertaken by the laibon in the past are insufficient evidence on which to base any theory that the institution of the laibon at any time approached the status of chieftainship amongst the Masai.

The picture of a pre-European laibon may therefore be re-constructed as follows:—

He was primarily the medicine man of the moran, both in respect of war charms and of supervising and blessing their promotion ceremonies. As junior elders, the Masai still maintained contact with the laibon (paying ngeherr fees) and as il *piron* elders visited him on behalf of the new age. But except as private patients the elders seem to have done less business with the laibon than they do to-day. Administrative, executive or judicial functions were not part of a laibon's duties, though he could exert a certain amount of control by judicious advice. He was in no sense a paramount chief.

/xiv cont./

114 776 782 113 and their imageless worship of God ("they have definite prayers and they petition the deity more frequently and fervently than the surrounding tribes are known to do" /cited in English/), stand unquestionably, just as generally a comparison of the book by Hollis, appearing shortly after Merker's book, with Merker's Masai is the best apologia for the reliability of Merker's ethnological as well as linguistic observations.

114 • 174 Another outstanding African scholar, the praiseworthy, well-known linguist Carl Meinhof of Berlin (now Hamburg), has above all, and, to be sure, for linguistic reasons, turned against Merker's designation of the Masai as a "Semite people," and with that then also at the same time against their onetime ancestral home in Arabia (2).

[113] 2. Cf. his review in Zeitschr. f. Ethnol., 36, 1904, pp. 735-744.

But what the Arabist Schwally (in Giessen) said about the Masai traditions (Archiv für Rel.-Gesch., IX, 1906, p. 505), that here "features of Semitic origin are well grafted on African ones" (but "when and under what circumstances is hard to say"), also applies to the language, as I was able to convince myself by a thorough study of Hollis' book. Definite remains show that the Masai must once have been Semites, and, to be sure, Arabian Semites. This will be briefly discussed in what follows next.

174 197 [173] [113] [80] Not only does their own tradition teach that they came from the north, but this is also confirmed by a comparison of some of their number words with those /xy/ of the Cushitic languages (especially Somali and Galla) and of Nuba. One should compare the following lists, to which I have also further added the number words of Nandi, closely related to the Masai, from the new book by Hollis (The Nandi, their language and folklore, with Introduction by C. Eliot, Oxford, 1909):

In the purely Semitic system, too, the Masai language is in very close harmony with the Galla and Somali, whereas in this respect the other Cushitic languages (cf. on this point my Grundriss der Geographie und Geschichte des alten Orients /Outline of the Geography and History of the Ancient Orient/, pp. 154 f.) show far more Nubs influence. The pure Semitic substratum of the so-called pattern of the imperfect /imperfektschema/ can also be clearly shown as lying at the root of the entire Masai conjugation: one should compare:

1. sing. *a-nduk*, I follow	pl. *ki-nduk*, we follow
2. sing. *i-nduk*, you follow	*i-nduk-nduk*, you follow
3. sing. *a-nduk*, he follows	*a-nduk*, they follow

where, in accordance with a phonetic change to be observed elsewhere in Masai, ti is reduced to i and ki has arisen from ni, so that we may therefore presume as the oldest form

S

193 which is exactly the Semitic conjugation pattern transmitted from
197 Arabia to the Cushitic languages (for example, Arabic a-kun,
• 194 ta-kun, ja-kun, pl. nakun, takfun, jakfun). But otherwise, too,
19 Masai, even though its vocabulary /xvi/ and much of its grammar
194 are so greatly Africanized, shows many traces pointing clearly to its onetime Arabian homeland. Among these I count the conjunctions o, "and" (from wa), and the consecutive pe, "and, so that," Hollis, p. 100, which is exactly the difference, so characteristic for Arabic, between wa and fa, or the remnant of a formation of singular nouns by the ending -a (il-akir, stars, ol-akira, a single star, Hollis, p. xxi), or the double function of the particle ma (both "not," likewise in Somali, and also "that," cf. Arabic mâ, "not" and "that which"), or also individual characteristic words that can scarcely be taken as later loanwords, but are to be regarded as ancient remnants, such as ararua, navel, Arabic surra; ssen, forest, Arabic sarw, forested mountains (originally cypress forest); kunoni, blacksmith, Arabic kain; remet, spear, Arabic rumh; morno, older man, husband, Arabic marû'; uo, to fear, Arabic wara'a; sun and day fem. (night and moon, on the other hand, masc.), cf. also Arabic šams, sun fem., and the expression al-lail wa 'n-nahâr (1).

1. Nahâr is an old (later no longer recognized as such) feminine form of the form fa'âl from nhr, "light"; lail is the masc. of laila (older lailat) with the same meaning, "night."

193 night and day, next to al-jaum wa 'l-laila. Pointing quite
197 specifically to the South Arabian Mahra language (thus the dialects
194 of Frankincense Land), from where so-called Ethiopian also stems, are some plural formations of the Masai, such as eng-aftin from eng-aC il-apaftin from ol-apa, etc. (Hollis, p. 25), cf. in Mahra ehelthan (from sybel, flint), haidenten (from haidân, ear); likewise Ethiopian esta (fem.), "which," and Masai enna, fem. of olle, as well as the feminine article en (in contrast to masc. ol).
000 According to Hollis, p. 275, the Pleiades are only six stars among

According to Hollis, p.275,
/xvi cont./ the Pleiades are only six stars among
821 the Masai, likewise in the pictorial representations of South Arabian
171 tomb inscriptions (in contrast to the seven circles of the Babylonian
174 Nergal symbol); the name of the bearer of the religious tradition
192 of the Masai, el-kiboron, coincides strikingly with the expression for priest, kabît, in the old Minaean inscriptions of Temen (?).

[576] 2. Quite remarkable also is the correspondence of the Masai custom that when one is inside with her he plants his spear in front of the hut so that another will not enter (Merker, p. 109 and p. 158) with the similar custom among the southern Arabs (here only staff instead of spear) given by Strabo (Book 16). -- Also that the "speaker" stands at the head of the warriors is reminiscent of South Arabia (cf. kail, chief, actually speaker, as well as saijid, "master," probably has the same etymology, cf. Syrian sewîd, speech).

192 The specifically Ethiopian word dengel, "virgin" (originally prob-
197 ably "young woman" in general), is the same as the Masai en-
197 garamet, is the Arabic el-kulîfbat, and cowbell, eng-gurugur, the Arabic al-gulgul, en-abere, spear, perhaps the Arabic al-ibra, needle. The name of the liana species mogonggora, from which the Masai take a fragrant wood for therapeutic purposes (Merker, p. 27 and cf. p. 196, ol-magirigirieni, a vanilla-scented perfume), is very reminiscent of the South Arabian name for frankincense, mugr, just as in general the reiteration of the second half of a word, popular among the Masai (for example, gadandar, a /xvii/ tree name, airalaral, a shrub), is likewise in turn a peculiarity of Ethiopian, where it is used especially for the formation of color names (warakrîk, gold-green : Hebrew jerakrak, hamalmîl, green, but also dabarbîl, backlike : hill, and the Tigre plant names gondefdafe, endufduf, amferfaro, and handugdug). All these
[114] are definite traces that make Merker's naming of the Masai as an originally Semitic and then, more specifically, an Arabian people seem fully justified.

/xvii cont./

171 173 To come now to the early histories, it is to be emphasized at the outset that, for any Semitic people, every time we come to the early period, through linguistic comparison, research into names, and literary remains, we are already able to uncover a well-established stock of myths that come very close to the Biblical early history (dragon fight in connection with the creation of the world, tree of paradise and serpent, first parents, flood) and furthermore, as religion, a moon cult (worship of the stars) to be described [233] almost as henotheism. But we come across exactly the same thing, in its most original form, among our cattle nomads, the Masai, whereby it should further be noted that also among the oldest Semites, whom we have to think of more as nomads than as agriculturalists, cattle, as their mythology clearly teaches, must have played a great role, not perhaps the small livestock or the camel and the donkey, to say nothing of the horse, which only became known from Elam to the Semites here around 2000 B.C.

174 171 173 192 There is also the fact that among the Masai we find a series of positively ancient traits that bring us close to the East Arabian [illegible] to us most clearly only in the religion of the ancient Chaldeans (and then transformed into the more polytheistically stamped one of the Babylonians). To these belong first of all the struggle of the deity with the dragon Nenaunir on the morning of creation: when Merker compares the word for dragon, en-diamani (fem.), with the Babylonian tiâmat (later popular pronunciation somewhat like tiamat), it is certainly not merely an accidental homophony, since the word for paradise, herio, also goes back to the Babylonian kirû, "garden," which in the Hammurabi period must still have sounded like the unconstricted kiriu (cf. similarly Nabû Nebo, at that time still Nabiu, and many other examples) (1).

1. When in Masai en-diamani also means fetus, embryo, Arabic again offers a striking analogy here: cf. Arabic el-gîn (from el-gînin), "demon," but el-ganîn, "embryo."

/xvii cont./

174 171 173 Now in ancient Chaldean astrology this original dragon is the female lion-headed dragon with a long neck localized on the later picture of the crab and which, on the cylindrical seals, looks like a lion's or dragon's head sitting on a pole (her husband is the so-called vulture-dragon, the Kingu of the Babylonian Epic of Creation); according to Hollis (p. 265), however, nenaunir means "the one /fem./ on the pole" and she was originally a lion (or half lion, half human being with which one /xviii/ should compare the Chaldean counterpart of the twins, the Janus-headed centaur that has a lion's and a human head). Furthermore, the name of the morning star, kilegen, which is precisely the Babylonian girgilu, "hen," belongs here; cf. the name of Venus, Nin-dar-anna, mistress of the hen of heaven (also masculine, corresponding to the nature of the morning star as contrasted to that of the evening star, Nin-dar-a of Gudea), which, as Gaĕan-Gir-gi-lu, already occurs in old Sumerian hymns (C. T. XV, 23, cf. Reisner, Hymnen /Hymns/, p. 138, lines 126 ff.). The sacred number of Istar (South Arabian masculine Astar), fifteen, also plays a role in connection with Masai births; among the previously neighboring ol-Gangana people (cf. the Babylonian Gangani?) for the birth of a boy the mother had to remain in the hut 30 days, for that of a girl, about 15 (30 is moon-number, cf. Babyl. Sin 30, his daughter Istar 15), Merker, p. 392, where the 15 gourd bottles with which the young man asks the father of the girl for her are also to be noted. If the three-headed serpent of paradise was called ol-arassumet because it lived in the reeds (= ol-rossua), it is also tempting to think here of a specific Babylonian word, namely, ruŭumtu, mud, swamp (at the latter, indeed, the reeds grow).

With regard to the individuality of the Masai legends, it is entirely original and, in spite of all the connections with the Biblical early history, a wholly independent impulse from the same source. This is expressed above all in the fact that for the most part quite different names occur; thus, Maitumbe corresponds to Adam (perhaps from a collateral form of Adam, ma'dûmu or maidûmu?), Tumbainot to Noah, Oschomó, Barímaro, and

/xviii cont./

174 171 173

Barmáo to his three sons, Sem, Ham, and Japhet, Narabá, or his double Metene, to Moses (cf. Metene and Rise = Moses and Aaron), Isaac to Mutari, etc. What has not yet been noted, however, is the quite similar predilection for popular etymological explanations, which are given for every Masai name of this early history. If one compares the respective Hebraic explanations for the names Eva /Eve/ (Gen. 3, 20), Kain /Cain/ (4, 1), Seth (4, 25), Noah (5, 29), Abraham (17, 5), Isaak /Isaac/ (21, 6), Jakob /Jacob/ (25, 26), Ruben /Reuben/ (29, 32), etc., etc., up to Mose /Moses/ (Ex. 2, 50) and Samuel (I. Sam. 1, 20) with the name interpretations of the Masai myths, likewise often far-fetched, for example, Naiterogob (= Eva) called her second son Nabe because he had moved (ebe) violently in the womb, or Nairascho gave birth to a son and called him Serea because the ox slaughtered by the father after the birth was spotted (sera), then with this fondness pervading the one side and the other to explain in some fashion all the ancient traditional names, one must exclaim in astonishment with Adam: This is now bone of my bone and flesh of my flesh (that is, parallel organic further development of a common tendency of early times, namely, the same natural disposition). The objection of skeptics that missionaries (whether of more ancient times, say, of the first Christian centuries, or more recent ones is immaterial) told the Masai those stories in the Biblical style (and together with those Biblical etymologies) and the latter then changed them in accordance with their understanding and mental life, that is, /xix/ assimilated them completely into their own national experiences, and, to be sure, also freely copied the interpretation of the names, completely misses fire here; it would be almost a greater miracle than the simple assumption offered by Merker that the Masai brought all these traditions from their Arabian original homeland, and that they (these ancient traditions) run parallel with the Hebraic ones and both are based on a Chaldean or East Arabian original

/xix cont./

174 171 773

that has been lost to us (1).

1. With regard to the references to those Biblical popular etymologies cited above only with numbers, at least an example should be given for those who do not happen to have an Old Testament readily at hand. Genesis 25, 25 says: "the first of the twins that came out of the womb was red (admôni, play on the word Edom) and was (rough) like a hairy garment (se'ar) and they named him (therefore) Esau ('esau, where the accord between se' in se'ar and 'es in 'esau is sufficient evidence); after that came out his brother, whose hand took hold of Esau's heel ('aḳeb), and they therefore named him Ja'ḳob." Actually, however, Jakob /Jacob/ goes back to a more complete form Jakob-el (in which God is the subject, therefore roughly: there follows on the heel God, that is, he rewards or punishes).

Indeed, in any case the matter is and remains amazing enough even so, but the imageless monotheism of the still so savage Masai, disputed by no one, is also a marvel and, up to now, unparalleled among the peoples of Africa.

114 773 171

I come now to the early history itself, which Merker, in Section II of his sensation producing Fourth Part, has already compared, bit by bit, with the corresponding features of the Biblical tradition. It should be noted in this connection that the deceased, who, as he told me himself, had no longer concerned himself with the early history of Genesis since his childhood, did not recognize all the correspondences at once, but rather had overlooked a few very important ones. Sellin, who himself wrote a brochure in 1905 on "die biblische Urgeschichte /the Biblical early history/ (in the Biblische Zeit- und Streitfragen /Biblical questions of the time and controversial ones/, by Boehmer and Kropatschek, Lichterfelde,

/xxi cont./

114 If one considers how common Arabian tribal and personal names,
773 such as el-'Âmir, 'Amâra, 'Imrân (from 'Amirân), are, there is
171 not the slightest reason, in connection with the Ameroi, to think of the Amorites, who have played a role only in Palestine and came from the north. More likely ol-Eberet, if not to be compared with, say, the Arabian al-Abrahat (Abyssinian Abraha, which, in any case, is generally equated with the Hebraic Abraham) or another similar-sounding Arabian name, might be identical with 'Eber, the mythical ancestor of the Hebrews, especially since ol-Eberet's son Gerêua sounds remarkably similar to Eber's grandson Re'û (LXX Ραγου, hypocorism of Re'û-el, Reguel) Gen. 11, 18, which again, however, only points directly back to East Arabia, the original seat of all the western Semites, since the district 'Eber-Peleg (2)

2. Cf. in this connection my Grundriss /Outline/ (Munich, 1904), p. 184, note 1.

roughly coincides with the Arabian district of Jemâma.

773 While the Masai early histories, as they finally became
171 available to Merker after prolonged effort, are still being carefully guarded by a few of the older people, there are also among
• 174 the myths generally widespread among the Masai, such as also became known to Hollis in British East Africa, some that are to be regarded as clear echoes of the sacred myths. Among these I count /xxii/ what Hollis relates (p. 270) about the god Naiterukop (the word, however, has the feminine article, thus the originatress of the earth, the foremost of the land), where therefore the Eve of the Masai has become a deity, whereas the reverse would be much less understandable; or the lowering of the cattle from heaven (Hollis, p. 270; cf. Merker, p. 359), or the story of Le-eyo's disobedience (Hollis, p. 271), in which I see a faint reminiscence of Merker's account of the fall, so strikingly coinciding with the Bible. If one considers how widespread the placing together of the tree of paradise and serpent was in the ancient Orient (up to the Greeks), then the preservation of this particular

/xxii cont./

773 feature among the Masai, with all the rest, is not so astonishing
171 (1).
• 174

1. Incidentally, I should like to point out that the name of the old medicine man Lesigirischi, Merker, 25, 386, is certainly to be compared with the name i-Sigiriaischi, which the Somali bear among the Masai (Hollis, p. 30).

114 I conclude these considerations with the certain expecta-
773 tion that now, when my deceased friend's book comes out for the second time, the early histories of the Masai will no longer encounter the skepticism to which they were exposed when they first became known, but that they will now be duly appreciated for their as yet incalculable importance to the history of religion, as they deserve to be. And I repeat once more
[174] that a Christian or Jewish influence, perhaps even in early
[177] times (at all events through the Christian Nuba of the third century A.D., or through the Jewish Falascha /Falasha/ on the borders of Abyssinia), from the older northern dwelling-sites of the Masai, is quite out of the question, since one would then, as Merker already emphasized, necessarily have to expect not only connections with the Biblical early and patriarchal histories up to the lawgiving, but also with the later parts of Biblical history (and above all some allusion to the Gospels, if Christian missionaries are to be considered). The previously discussed connections with the Chaldean early histories, and, to be sure, at points not touched on by

First Part

I.

000 The Semitic immigration to Africa. -- Only traces still give evidence of the oldest immigrants. -- Later immigrants: Wahuma and Watussi, Tatoga, Masai, Egyptians. -- The Masai as Semites. -- Somatically the Jews are not Semites.

• 174 The Masai belong to the great Semitic family of peoples whose ancestral home is the Arabian Peninsula, as the nursery of the Semites. Famine, as a consequence of overpopulation, with which the productive capacity of the poor soil could not keep pace, was probably the reason that gradually, in the course of millenniums, drove the individual Semitic peoples out of that ancient area of habitation and forced them to seek new pasturelands. The stream of peoples thus forced out of the north of the Arabian Peninsula took essentially two routes: one part wandered across the African-Asiatic land bridge into the dark continent, the other kept to a northerly course and remained in Asia.

According to the picture that the interior African Semite peoples present to the investigator today, one can not assume that still existing communities or even merely unmixed individuals have been preserved from the oldest immigrants. On the other hand, it is to be expected that with a thorough investigation of the sedentary Negro peoples (1)

1. I designate as Negro /Neger/ or Nigritian /Nigritier/ the big-boned African peoples whose bodily structure is thickset to heavy, whose facial features are "Negroid," that is, exhibit thick, protruding lips and broad, low noses, and whose skull is rather markedly prognathous. One cannot as yet trace their origin beyond the borders of Africa, hence for the time being they are regarded as original inhabitants of Africa.

/1 cont./

• 174 around the equator traces of them will still be found. Such traces (2)

2. I found such traces in Iraku and Umbugwe, but the material collected does not yet permit any definite conclusions.

may exist in the presence of a greater number of individuals in whom, through the energy of hereditary transmission, a pronounced Semitic type has been preserved; furthermore, in the presence or, probably /2/ more accurately, predominance of the basic ethnographic traits peculiar to the Semites, and finally also from remnants of their language. I purposely put the latter only in third place here, because up to now too much value has been attached to it in the determination of races, even of mixed races, and linguistics still much too often claims for itself alone the decision as to which human race a people is to be included with. That a people might change its language by no means stands isolated in history. One merely thinks of the Visigoths in Spain or -- what is closer to us -- the Germans in Hungary and in the Baltic provinces, in order to realize what a few decades can accomplish in this respect. But what the peoples nowadays relinquish drop by drop was reached more rapidly and thoroughly in antiquity, where often enough all the mental life proceeded from the priests of the state religion.

But let us return to the interior of Africa.

With regard to the Semitic peoples of East Africa, at present we still lack the necessary foundations to determine precisely the sequence of their immigration.

000 For example, there are the Wahinda and Wahuma, whose place in the Semitic immigrations to Africa is still very uncertain. Those who have recognized them as Semites regard them as the oldest traceable immigrants. I must reserve judgment, since I do not know these people personally, and I shall limit myself to offering the following for consideration. The somatic characteristics of both nations, the energy in preserving the purity of

/3 cont./

T 174 band of Masai people, and then sought new places of residence in the neighborhood of Usukuma. Friction with the natives there seems to have been the reason that part of them wandered back to T [36] the southeast again and, after a futile attempt to move into [178] Umbugwe, settled down in the vicinity of Iraku and Ufiomi. How [241] little they succeeded in accomplishing the transition from nomads [181] to agriculturalists is clear from the fact that they are the Blacks just about the most degenerate in filth that I have ever come across, and that they still always live by sponging from the long-sedentary neighboring peoples.

M 174 The Masai, to a description of whom the present study is devoted, immigrated to Africa later than the Tatoga in my opinion. In the second chapter of the fourth part I arrive at the postulation that the immigration of the Masai may not have taken place after the period of the fourth dynasty of the Pharaohs.

One of the last Semitic immigrations by way of the Isthmus of Suez in antiquity is that of the Egyptians (1),

> 1. Linguistically, too, the affiliation of the Egyptians with the Semites is now definite, according to the results of Erman and Sethe. [At the least they are a mixed people with a strong Semitic strain.]

who there became the founders of that high culture. They closed the gate of Africa for further immigrations of larger masses of people. From then on, therefore, the stream of peoples went from Arabia essentially to the north. True, there was no lack of attempts by Semites driven out of Arabia later, following the old routes, to penetrate into Africa. But mighty Egypt prevented this -- fortunately for those peoples. The old Israelites should therefore have been grateful to the Egyptians for halting their migration, instead of complaining that they were drawn on by them for labor, which, to be sure, may indeed not have been easy for them as

/3 cont./

• 174 free and work-shirking nomads (2).

2. I in no way want to maintain here that the stay (as well as the entering and leaving) of the children of Israel in Egypt described in the Hexateuch is historic; rather I suspect that this recital has two or more events worked up in it: the first great encounter of the old nomadic Hebrews with the Egyptians, and the later military encounter between Egyptians and Jews, especially in the Ramses II period.

/4/ On the point of the affiliation of the Masai with the Semites a few more words seem necessary, especially since by earlier travelers -- insofar as I know their works -- they were always taken for Hamites. With respect to its race a people is to be judged from three points of view: according to its somatic characteristics, its psyche and its visible expressions, and, finally, according to its language. In the first direction Dr. v. Luschan has already recognized the Masai as Semites. On the second point, I believe it is to be proved in the following, and, concerning the language, a study by Deeg, unfortunately still not yet published, will furnish lucidity on it.

000 May I be permitted here to advance to a still rather widespread misconception. When the layman hears of Semites, he thinks, as a rule, of people who outwardly are similar to, or closely resemble, the modern Jews. Now this is completely false, since the Jews, in general, are no longer Semites. They were this as a strong nomadic people; but already during the transitional stage from nomadism to a partial, occasional sedentariness there began the blood mixing, which, after complete sedentation, became especially vigorous and through that the bodily form very greatly changed and developed into a new one (1).

1. The Bible in various places tells about the mixing of the Hebrews with the Hittites. First

/4 cont./

• 174 142 The Semites are tall, slim figures with agreeable, finely chiseled facial features, narrow, often large, but not unhandsome noses, and small, not rarely actually pretty feet and hands.

000 Among the present-day Jews the pure Semite type is probably not frequently represented. The Jews of Aden seem to me to exhibit it still at its purest. On the other hand, the majority of the present-day Jews show more or less clearly /5/ characteristic features of the Hittite race, of whom we know that one of the tribes affiliated with them, the Mitani, formed a mighty realm as early as the beginning of the second millennium, the boundaries of which extended south as far as the Lebanon, and which may earlier have already sent ahead swarms of people to the south. About the fate of these forerunners neither Egyptian or Assyrian accounts nor their own monuments or inscriptions give us information, so that for the present we probably may assume that they merged with foreign peoples -- of the Semite race -- whereby they passed on to them their unhandsome somatic characteristics. We know the latter in their original state only from the monuments left to us. According to them, the Hittite type is characterized by markedly brachycephalic heads, dark hair, dark eyes, large hooked, fleshy noses, a markedly receding forehead, prominent cheekbones, large bones, and, conditioned by that, a heavy bodily build.

174 142 Now we find the somatic characteristics ascribed above to the Semites represented neither in each Masai nor their totality in the majority of the Masai. Rather, the latter shows the above type in a more or less coarsened form, which, nevertheless, a practiced eye recognizes without difficulty as Semitic and is able to distinguish from that of the Nigrito-Semitic or Semito-Nigritic mixed peoples and which even the novice will not take as "Negroish."

174 121 May it already be said here in advance that I regard the Masai as descendants of those nomadic Semite peoples who belonged to the pastoral tribes of the most ancient Hebrews. I believe I have proved this surmise in the following -- especially in the fourth part of the present study.

/5 cont./

II.

000 The East African steppes as habitation area of the Masai people. -- Their immigration in three corps. -- Their battles. -- Division and distribution of the land among Masai, Wakuafi, Wandorobo and their attitude toward one another. -- Influence of the Masai people on the sedentary tribes. -- Mixture with Negroes. -- The somatic characteristics of the three branches of the Masai people show their racial connections, the ethnographic ones their social connections.

131 Between the 34th and the 38th degree of longitude and the 3rd degree north and the 7th degree south latitude, in German and British East Africa, we find large steppes, which are often designated as the Masai steppes after their inhabitants. They are bounded by hilly lands that are mostly thinly populated, especially by sedentary Negro tribes, and are more or less well cultivated.
133 The terrain formation of the steppes is sometimes flat, sometimes undulating or rolling, sometimes hilly and, in this case, usually determined by volcanic activity. This stands out especially drastically on the Kenia /Mt. Kenya/, Kilimandscharo /Kilimanjaro/, Meru, and Ol Donjo l'Eng ai, on the latter of which, for example, on a narrowly circumscribed space /6/ between the steep slope of the Mutiek Plateau, the Gilef and Timbati mountains, hill follows hill and almost every one bears or conceals the ruin of a crater, a landscape such as we are familiar with from photographs of the moon.

13 The extent of the steppes, in connection with the existing
[182] amount of precipitation and water sites, made them a more than adequate region for a stock-raising nomadic people. The very saliferous soil produces excellent fodder grasses and provides salt licks in countless places.

17 As far back as the history, the memory and tradition of the
131 people of these regions extend, and certainly still many, many centuries longer, these steppes were, and are up to the present
• 174 day, the arena of the Masai people. On the migration, or, more accurately, slow push, they came from the north, out of the

/6 cont./

• 174 original homeland, which is to be sought in the northern part of the Arabian Peninsula. Only at the equator did the march to the south stop. Here the Masai found not only steppe regions such as they required for their herds, but also tribes of people such as they needed, as victims of their war expeditions, for their own survival.

000 The agriculturalist finds his sustenance in the soil; the one who carries on agriculture and stock raising finds in the former an adequate livelihood, even during periods that are unfavorable for stock raising, and he can, through the more stable trade relations that he owes to his sedentariness, acquire the new breeding animals that are needed to prevent too extensive an inbreeding of the livestock. On the other hand, a culture-poor nomadic people that lives solely and only from the livestock is in a much more unfavorable position. Merely to protect the herds from degeneration, a constant supply of breeding animals on a large scale is an urgent necessity. Moreover, because of the rinderpest, periodically appearing and in Africa, unfortunately, almost never dying out, and other epidemics, ruin very often threatens the stockbreeder, if in such cases he has no opportunity to replace his losses as quickly as possible and to obtain vegetable food in the meantime. Steppe peoples are aggressive, and for culture-poor peoples in [101] general might always comes before right. There now live in the mountain lands lying on the borders of the steppes, and in the ones enclosed by them, Negro tribes who, in relation to the Masai, held together by firm organization and a high degree of tribal arrogance, and exceedingly mobile, are very immobile, for one thing, but then also are bound together within their own tribes only by a greater or lesser degree of herdlike obedience. They [439] are accustomed to seeing, even in their sedentary neighbors, their born enemies; they live constantly at war among themselves, even in a small space, since often each village is independent, and thus must have been desirable neighbors for the Masai, from whom the latter could at any time obtain both vegetables and, what was of special value, livestock.

Dorobo FL6

/7/

M 174 D 174 In three mighty corps that followed one another at long intervals, the Masai people came from the north drawn toward the equator. The long separation from one another in space and time, their different length of residence in the new East African homeland, and the different shaping of their fate conditioned by that make them appear to us today as three branches of the Masai people.

D 174 [101] The remnants of the earliest immigrant band are the Asá, more generally known under the name of Wandorobo /Wandorobbo/ (a Bantu formation from the Masai word El dorobo = the poor), of whom they form only a part.

D [233] Although the tradition of the Asá has nothing to say about a former possession of livestock, one must nevertheless assume, especially on the basis of their ethnography, that they immigrated as stock-raising nomads and, as such, took possession of large parts of the steppes. Wars among themselves, livestock epidemics, and, D [648] finally, the pressure by the Tatoga weakened the Asá to such an extent that it was easy for the second band of Masai, the El kuafi, the first sections of which were the El lumbua, and the later ones the El muli, when it came in, to drive out the ruined ones altogether. D [224] [735] A part of them found refuge among the neighboring agriculturalists, with whom they merged, another part among their oppressors, who adopted them as members of the tribe: the rest, however, withdrew into the forests and bush of the steppes, where still today, in great poverty, they make a poor living by hunting.

M 174 184 648 [731] The fate of the Asá, however, was not to be spared the El kuafi either. After a rather long period during which they competed with the Tatoga for dominion in the steppes, the rinderpest appeared again several times and, as before, brought poverty and death. And again, as before, the one misfortune did not remain alone. The third band, the El máasai (sing. ol máasaí), immigrated here from the north, and it looked as though it would rapidly complete, by means of bloody fighting, the destructive work of the epidemics. But the presence of the Tatoga, who in places were just as powerful as they were feared, diverted the bellicosity of the Masai. They joined the El kuafi for the common fight against the former.

/7 cont./

000 against the former. The El kuafi recognized the chief (ol oiboni)
174 of the Masai as also their own and seem for a long time to have
184 been on the best of terms with them. Then -- so the tradition
669 tells -- a girl named Matangó, from the family of the ol oiboni
619 Sitonik -- she is usually designated as his sister, more rarely as
726 his aunt -- took a fancy to a member of a legation of El kuafi
[173] warriors sent to Sitonik and went away with her lover. When she bore him a son, the El kuafi proclaimed him their ol oiboni and at the same time refused to obey Sitonik. With this the war began between Masai and El kuafi. They lasted -- so it seems -- the entire first half of the nineteenth century and occurred sporadically even in the second half of it. One of the decisive battles was at Kisongo, a six-hour march west of Meruberg /Mt. Meru/, where later on the chiefs of the Masai took up their permanent /8/ residence. *The ones driven away went into the rugged forests of*
[466] Meruberg, where they lived for a long time in constant strife with the Masai, until the chief Mbatyan completely subjugated them and forced them into compulsory service. Other battles took place near Ngurumán, north of Lake Natron: the rest of those conquered still live there, mixed with Wasegedju from nearby Sonjo. The
[361] remnants of the ones defeated in the Serengeti steppe are still to be found in Taveta, Kahe, Aruscha-tschini. The first battles between Masai and El kuafi probably took place in the vicinity of Kenia /Mt. Kenya/, and led to making the latter sedentary.

One of the last great clashes was in the steppe area Sogonoi: the ones conquered fled to Ngujuka and then farther to Useguha and Mahga, where they founded a settlement under the chief 'Lemá.

The Masai took a few individuals from among the defeated
174 into their community. The rest split up. One -- larger -- part
184 became sedentary and formed some colonies in the vicinity of
619 foreign tribes or merged with other tribes. Another -- smaller --
[361] part at first made a living for a time from hunting, until it
[721] succeeded, by means of raids against sedentary peoples, in coming
[231] into the possession of livestock again. Today they again live
[101] wholly as before and are distinguished from the Masai only by

M 174 184 619 [101] [361] /8 cont./ the name El muli. Those who became sedentary, however, are designated by the Masai as El lumbua and also as El kuafi -- probably because they constitute the main part of the old El kuafi. The caravan people, accordingly, call them Wakuafi, while they make no distinction between El muli and Masai and even impose on the former the name of the latter.

M [144] In contrast to the El muli, who have remained pure, the El lumbua of all the settlements are more or less strongly mixed. In places the degree of mixture is so great that at first glance one scarcely recognizes the somatic features characteristic of the Masai people; in places, however, it is also still so slight that any mixture at all can only be determined by thorough investigation.

D 174 M 174 184 A last group[1], finally, became hunters, the El asiti. This is the second branch of the Wanderóbo; the third and most recent, the El gasurek, arose from the Masai themselves, in that those impoverished by livestock epidemics were forced to a new means of subsistence.

M 634 635 [648] Even up to 17 years ago the Masai were the lords of the vast steppes in German and British East Africa, when the European occupation brought about a change. The entire land inhabited by them is divided into three provinces. The Kisoñgo Province embraces those steppe regions that lie south of the line, extending east-west, connecting the peaks of Kilimandscharo and Meru. North of this lies the province of Loita, and still farther north, embracing the region of Lake Naiwascha, the province of Ol bruggo. In earlier times a part of Loita called Es serehget seems /9/ to have temporarily formed a province by itself. Each province (ol oscho 'bo = a province) is divided into districts (eh gob = the land), and these again into areas. Most of their names are proper names that can not be translated; others are chosen from local peculiarities, for example, springs, brooks, hills, mountains, trees, etc. The inhabitants often name themselves after the individual M [101] provinces or districts and then speak of Kisoñgo-Masai, Loita-Masai, Serehgeti- or even Kiteto-, Moibo-, Sogonoi-Masai, etc. M 192 101 Earlier travelers often mistakenly took this designation for tribal names. Similarly, the word ol oikob has been misinterpreted,

1. [The reference is to the last group of the original Kwafi--Analyst]

/13 cont./

MD 142

eyes are almond-shaped, straight or somewhat slanted. The nose is extended, narrow, and, at the root, flat or very moderately deep-set compared to the forehead. The alae are narrow and very flat, the nostrils roundish to longitudinally oval, less often transversely oval. The bridge of the nose is straight, sometimes slightly convex. The lips are full, without appearing actually protruding. Protruding, thick lips are something so rare and striking that they earn their owner the name Lebeleb -- thick lip (or actually: uproar, loud noise). The ears are small, except for the hyperplasia of the upper edge of the ear and ear lobes caused by the wearing of heavy ornaments. The hair is evenly distributed over the scalp, which is most clearly shown on recently shaved heads. The hair often appears "tufty," but this is artifically produced. Only at a length of from one to three centimeters does it curl slightly and /14/ almost never becomes completely curly. The arms and especially the legs are very long, the wrists thin, hands and feet, especially among female individuals, small, narrow, and delicate, the fingers are slender and often strikingly long and narrow, the fingernails long, narrow, and slightly arched.

MD 619 • 174

Even if the racial membership of the three branches were to be traced anthropologically, one can determine an even closer connection ethnographically, which must lead to the conviction that all three belong to the same people. The difference in their principal occupations, to be sure, seems at /Ill. 3 appears here/ first glance to indicate a sharp division. As has already been pointed out above, however, one can easily explain these differences by the consistent behavior of a people of similar customs and habits under unlike external circumstances. The predilection for stock raising, based on the eagerness for a meat diet, and the nomadic life necessarily growing out of it were common. While the Wandorobo had to endure it when their livestock fell victim to epidemics and raids of the strong Wakuafi, the latter, under pressure from the still mightier Masai, had to flee from the open plains to fixed residences in the mountains. The Wakuafi protected

The Wakuafi protected what remained of their livestock by giving up their roving life, whereas the Wandorobo, by sacrificing their herds, were able to continue their fancied nomadic life as hunters; and neither of them needed to forgo the meat diet.

M
174
619
197

/15/ Even though, in general, one should be very careful in ethnology about drawing conclusions from linguistic bases, it seems permissible here, on behalf of the three branches' belonging to one people, to point to their language as well.

As a matter of fact, we find the same language among the Masai and Wakuafi, with the limitation that for the latter, with the great number of Masai dialects, sometimes this one, sometimes that one is their own, according to the location of their area, whereas the very widely ranging Masai probably understand almost all the dialects. In addition, for the Wakuafi, in places, according to the degree of their mixture with Negro tribes, a language of the latter's is more or less familiar. Of the Wandorobo, the El gamwek speak only the language of the Masai, whereas the Aná and

D
197

/15 cont./
the El ambi also have their own bilum, which will be briefly discussed at a later place.

Corresponding to the uniformity in language, the number words are the same among the Masai and Wakuafi, whereas the Aak and El ambi have their own words for only a few numbers, but in general always make use of those used by the other two branches. One finds a complete correspondence for all three branches in their religious view, and the manner of circumcision customary among both sexes. The peculiar circumcision of the boys is practiced by no other people at all, with the exception of one lineage of the Tenga, closely related to the Masai people. In birth and death, too, all three have the same customs, while in the rest of their customs one finds only unessential differences which are based solely on the difference in their external way of life. The most striking proof for the three branches' belonging together, however, lies in their descent.

The people as a whole are divided into three large tribes, the Il oiot, the Il molelyan, and the Il oolgana, each of which is made up of a number of lineages, and every Aak, as well as every Ol laali and Ol mamai, is a representative of one of these lineages.

If we now concern ourselves further with the ethnography of the Masai in particular, which is at the same time that of the Wakuafi, we are thereby including the ethnographic traits of the entire people the showing of individual differences that have developed among the Wandorobo in the course of time and under the influence of changed conditions will be reserved for the third part.

/16/ Second Part

Tribes, lineages, sublineages. -- The Il gilak lineage. -- The chief: his rule and policy, magic medicines, genealogical tree, village, ceremonies, feuds. -- The earcorns. -- The Il kiboshi lineage. -- The reinstalmen.

Every tribe (ol ghekuat) is divided, as has already been mentioned, into a number of lineages (ol gototo, el gotot). Among these, in turn, one distinguishes principal lineages (ol gototo kiuk)

/79 cont./

714 which only the brave are entitled to wear, the *os serata l el kigelani*.
531 A shield emblem is complete if, in addition to the ornamental band, it also contains the red warrior-emblem.

The ornamental band is the stripe painted in the longitudinal diameter of the shield. Actually *os engiro* is the name of the cowrie shells that, sewed on leather strips, adorn the gourd bottles. The similarity of such an ornamental band with the longitudinal stripe on the surface of the shield explains the Masai word used for this and my translation as ornamental band. The drawing of the ornamental band is unimportant and is often subject to the taste of the moment. Considerable differences exist both between the provinces and within the individual ones.

714 531 639 184 The most important emblem on the shield of the warriors is the red warrior-emblem. Three forms of it are distinguished: the double wedge (Plate 1: Figs. 2, 4, 6, 9, 13, 14, 15, 17) along the ornamental band belongs to Kimáñgo Province, the segments of circles (Plate 1: Figs. 5, 7, 10, 18) on the ornamental band are the emblem for Loita Province, and the peripheral emblem (Plate 1: Figs. 11, 12, 16) shows that the bearer of such a shield belongs to Ol bruggo Province. The warrior emblem is either on both halves of the shield or only on one: the former is the rule in Ol bruggo and Loita, the latter /[illegible]/ in Kimango. Loita and Kimango, however, show more exceptions. If the red emblem is painted on both halves of the shield, the one half shows the mirror image of the other, so that a symmetrical double emblem results, the center line of which is formed by the ornamental band. According to my explorations, this seems to have been the fashion especially after booty-rich war expeditions. On the other hand, where the red emblem is found on only one side, the other half of the shield shows one or two large, black, bow-shaped emblems (Plate 1: Figs. 1, 3, 8, 11, 16, 17, 18). These are commonly found in Kimáñgo, where they have been customary for as long as the memory of the people extends. They are never in Loita /[illegible]. It appears here/ and, to be sure, really only since the death of Mbatyan. Mbatyan resides in Kimango, and his bodyguard consisted of Kimango warriors. After his death Zendeo put together a guard made up of Loita warriors and also stayed largely in Loita in order to avoid the

/80 cont./

714
531

714 influence of the Moschi military station better. The answer to the
531 question concerning the meaning of the black bows was almost always
634 merely that they probably served as ornamentation, since, with the
184 application of the warrior emblem on the one side, the other half
791 of the shield would look unattractively empty, and only a few old men
179 opined that it was originally a lineage emblem of the Ilgidol. This conception seems to me the right one, and it would explain why the emblem /81/ has been commonly used in Kisongo from time immemorial and then also came to Loita after Mbatyan's death.

714 The lineage emblem is almost never found on the shields of
531 today: thus I did not come across it until I had drawn by a number of
613 old men the shield escutcheons carried by them in their youth. The illustrations of Plate 2 show a collection of lineage emblems. We see there that the emblem is sometimes applied on the front of the shield surface, sometimes on the back of the shield. While the
[561] warrior emblems have remained the same for a long time, the lineage emblems were always quite variable, and it seems that each age class made up its own.

1. [See p. 608--Analyst]

411 /131 cont./ The
[237] beautifully worked scabbard (ol ⌐ashi, ⌐ashani [Fig. 21 c and
[186] 23]) is made from goatskin or neat's hide and dyed with the red juice
[124] of the root of the shrub ol gwiendwe L.ep dok (1):

1. Plumbago zeylanica.

on the back side is found a longitudinal middle seam and on the front side a corresponding longitudinal fold. Twelve centimeters from the upper edge /131/ of the scabbard there sits on the front side an oblong eyelet (ol ⌐lash, ol ⌐ummchi) through which the belt (ol ⌐lashi, ⌐lashin [Fig. 23 b]) worn around the hips is
[237] stuck. The latter is made of neat's skin and decorated with several
[56] longitudinal folds. There is a hole (en ⌐ndoin, ⌐ndoi) at one end, and at the other one a small leather strap (olg ⌐ne, ⌐ge). The sword is worn on the right side and drawn with the right hand. Left-handed men wear it on the left side. This carrying method seems
[174] to point to the fact that formerly the people did not carry swords, but daggers, for a sword can be drawn with the right hand better from the left side, whereas a dagger is more quickly ready for a thrust from the right. Moreover, the sword, even today, is also frequently handled like a dagger.

714 According to the tradition of the people, the original Masai
171 shields were very small (shield = ol ⌐ldi). They had a circular, flat
[173] shape, a round umbo in the center, and a diameter of 30 centimeters. The grip stick was fastened on the back side with small straps, which were drawn through the shield. The very light shield was carried with two fingers at the grip stick. Accordingly, the hollow of the umbo was very small. Gradually the shields became larger, and the reason for this may be sought in the frequent conflicts of the Masai with peoples
[237] carrying bows and arrows. Since in its original shape, the shield, with its enlargement, lost firmness, this was increased in that a wooden frame (ol ⌐ewenai, ol ⌐ewiwa) was sewed around the outer periphery with strips of goat or sheep skin, the shield was bellied out, and, to preserve the longitudinal convexity, two straps (e ⌐ewiwa)

/301 cont./

#121 its conquest by Israel, and that the Jews found them a soil already long worked by the ancient Babylonian culture, which made it easier for them to adopt new culture elements and alien ideas.

Let us now briefly consider the question of when Israel is supposed to have come to those Babylonian ideas. In addition to what was regarded as specifically Babylonian in those common myths, there was also found much that was genuinely Israelitish, among which is to be counted, above all, the monotheism prevailing everywhere in the Old Testament. Those ideas must therefore have undergone a long development in Israel before they could have assumed the forms in which the Bible has handed them down to us. This led to the assumption that the influence emanating from Babylon began to have an effect on the Israelites around the middle of the second millennium before Christ through the intervention of the original inhabitants of Kanaan /Canaan/. The discovery of the Tell el-Amarna tablets, which, among other things, taught that even at that time there was an active correspondence in Babylonian script and language between Babel on the one hand and Egypt and Palestine on the other, strengthened that assumption.

This brief sketch may suffice to show how and when Babylonian influence could have influenced the mental life of Israel.

Let us now turn to the Masai!

#193 Here we found the surprising fact that a large number of ideas,
#191 especially in the myths of the primeval age, remind one in part
#121 very strongly of the respective accounts as the Bible teaches them to us and the Babylonian excavations show them, in part correspond only with Old Testament ones. Four possibilities come into consideration to explain this amazing phenomenon:

1. the Masai, too, have been influenced by Babylon;
2. those ideas have been brought to the Masai through Islam or the influence of Israelitish or Christian missionaries;
3. what we find in common among Masai, Israelites, and Babylonians is of common origin;
4. those ideas originated among the Masai people.

#121 /302/ In order to investigate the first possibility, there is first
#194 to be answered the question as to when the Masai left their original

/302 cont./

*121 homeland in the Arabian Peninsula. Arguing against the assumption
• 174 that they passed through the land of Egypt in Egyptian historical times -- approximately 4000 b. c. -- is the complete absence of Egyptian documents about such an event (1).

> 1. It is very improbable that in the as yet little known periods from the 7th to the 11th and 13th to the 17th dynasties larger migrations of peoples passed through Egypt. For there would then be at least hints of such profoundly decisive events. On the other hand, however, it is not impossible that in the almost totally unknown period before the 4th dynasty large migrations of peoples took place within the field of vision of the Egyptians. If this is the case, however, it can not have been a matter of the Masai people, but of peoples such as the Somali, Galla, etc., who immigrated to Africa after it.

Or could one assume, say, that the Masai were at that time such an insignificantly small nation that their passage through Egypt remained unnoticed, so to speak, and appeared not worth recording by their contemporaries? In that case would it not have been probable that the small band remained in Egypt and perished there? And how, on the basis of such an assumption, is it to be explained further that the Masai were able to develop into such a mighty people in the African steppes, since history teaches us that the equator sets a limit for those steppe peoples who immigrated from the Near East? Just as the two Tatoga peoples and the first two immigrant bands of the Masai have already perished, so today we see the Masai themselves hastening, step by step, toward the same fate. A further argument against the above assumption lies in the habits and customs, in the entire ethnography of the Masai. A small, weak people could neither have maintained itself in its Near Eastern originality, nor would it have been able to force so much of it on other peoples with whom it later came in contact. I believe these considerations may suffice to make probable the assumption that the Masai were already a strong

/302 cont./

*12 • 174

and mighty people at the time of their immigration to Africa.

Now how would the passage of the Masai through an Egypt dominated by a political commonwealth have appeared? Could they have wandered through slowly and peacefully, or would they have had to force their way through by war? The first possibility is improbable because of the circumstance that the Masai at that time would seem to have already become a strong people. With the fact, however, that they also remained such a people and, further, that their ethnography nowhere shows traces of any influence by the arising or existing civilized state of Egypt, it entirely leaves the realm of probability. Thus we arrive at the assumption that the Masai must have had to force their passage through Egypt by war, and this would surely have been an event about which -- if it occurred in historical times -- many inscriptions would give us information.

/303/ Now there remains still another -- less improbable -- possibility, namely, the one that the Masai immigrated to Africa in Egyptian historical times and, without crossing Egypt, moved south along the Red Sea, like many Bedouins still today. If one considers that the Egyptian government is still unable to exercise any effective control over the indeed only small Bedouin bands migrating back and forth between the Nile Valley and the Red Sea, it is, indeed, in and by itself not impossible that at the time of ancient Egypt larger masses of peoples might have passed along those routes through the desert from watering place to watering place. Such a route would have given the Masai the possibility of an immigration without warlike encounters with the Egyptians, provided that the latter did not see in those hordes threats to their own security and therefore did not proceed to attack them. Be that as it may, the Egyptians could not have remained ignorant of the passage of such large multitudes of people, rather, it would have had to aroused their attention if only on account of the possible danger from it for their trade relations to the south, and therefore we may assume that if the migration had taken place at a time from which we have documents from them they would probably have told about it.

/303 cont./

*121 174 The last possibility, an immigration across the Red Sea, is out of the question for the Masai. Livestock-raising nomads cannot travel in this way with their herds.

I therefore come to the conclusion that the Masai had already moved into Africa long before the period from which we possess Egyptian documents. With this answered; the first question is already for the influence of Babel, whose civilization did not arise until the fourth millennium, could by no means have been so far-reaching then, and, moreover, the shamanism of the Sumerians still prevailed there at that time. But even if one could postulate a later immigration of the Masai into Africa, there is still lacking any reason for the assumption that the Masai had ever been sedentary. This, however, would be the basic condition for the possibility of Babylonian influence. Babel, with its so much higher civilization and its mighty army, would have been able to draw into its orbit a sedentary people of agriculturalists; but it could not have exerted an influence on a nomadic steppe people, either through mental superiority or through force, without previously robbing it of its independence. Loss of independence for such a people, however, means nothing other than decay of the people's stability -- extinction. Also, however, if an influencing by Babylon were conceivable in temporal or local terms, the possibility of such would be most clearly and positively excluded by the content and spirit of the Masai tradition itself.

*121 797 177 174 [015] In order to eliminate the second case, there is first to be substantiated the fact that, as far as we know up to the present time, never and nowhere have Islam, Judaism, /304/ or the Christian missions been able to exert an influence on the Masai people restlessly wandering across the steppes. I must also exclude the possibility that my informants (people 50 years of age and more) could have been influenced on those points in the aforesaid ways, according to my investigations conducted exhaustively along these lines. Moreover, the people assert most emphatically that they learned those accounts from their fathers, who allegedly in turn heard them from their fathers.

/304 cont./

*121 Now the fact that missionaries of whatever faith, as far as we
797 know, have never exerted any influence on the Masai people does
177 not, to be sure, exclude the possibility of an influence in the
•174 aforesaid direction on single individuals who, be some chance, for example, in war as war captives, were separated from their people. That these then returned to their people and were able to report what they had heard there would likewise be conceivable. Be that as it may, however, could some missionary activity among the Masai that has remained unknown to us or the circumstance that persons individually taught by missionaries were anxious to disseminate what they had heard among their fellow tribesmen really have put the Masai in possession of those accounts such as I found among them?
*121 Would it perhaps be possible that Israelitish, Mohammedan, or
*773 Christian dogmatists, none of whom have any tradition older than
797 that of the Hexateuch for those myths, could have disseminated
177 them in the form in which I found them among the Masai, in a
174 form that is much older and more original than that of the Bible and that has much to report that was already forgotten at the time of the drawing up of the Biblical texts in question, or what, through the further development of religion, to which the sedentation of the Israelites gave a mighty impetus, had long been displaced and supplanted by new ones corresponding to the newly achieved cultural level? The differences that separate the myths of the Masai from the Biblical ones will be pointed out in the comparison to follow and will show us that the Masai could not have arrived at those accounts through the intervention of the missionaries, who -- I repeat -- could only have drawn upon the Hexateuch.

Now one could perhaps interpose: is it not possible that missionaries imparted to the Masai these primeval-age reports in their Biblical form, and that the Masai then altered them in accordance with their understanding and their way of thinking? This is to be
*[171] answered: how can one then explain the fact that the Masai arrived at precisely the form that, though no longer contained in the Bible in clear words, is nevertheless still to be recognized from it? I am thinking, for example, of Jahve's /Yahweh's/ struggle with the dragon preceding the creation, further of the assumption of only

/304 cont./

*121 one forbidden tree in paradise, then of the first murder as the cause
*773 for the deluge, of the clearly recognizable separation, at various
*171 points in the Masai tradition, of source material woven together in
797 the Hexateuch, and finally of many other /305/ passages that will
179 be pointed out in what follows. Are these all supposed to be coin-
• 174 cidences? If it were only a question of a single point one could perhaps provisionally, for want of a better explanation, accept the assumption of a coincidence. But then one can not go on doing that forever when the correspondences pile up to such an extent. This also applies in linguistic respects, for the similarity of sounds in the personal names of both series of myths and for the meaning of names for which the Bible gives no explanation and which the Masai tradition interprets in a sense contained in the corresponding Biblical account, such as, for example, the names Naraba and Eramram.

Further, however, it is also to be considered that the primeval-age tradition that I found among the Masai and for which the Bible contains parallel passages concludes with the epoch of the law-giving. This fact gives further important proof of the impossibility that it could have been foreign dogmatists who brought the Masai those myths. Though in and of itself it is conceivable that Israelitish religious messengers might have made a particular impression on those accounts from antiquity, it is nevertheless most improbable that they would have limited their teaching solely to these and would not also have spoken of Jahve's action in later times. Christian or Mohammedan missionaries, however, would not make the material in question the most important and only subject of their teaching activity at all, but would fashion it for a dissemination the essential teachings of Christ or Mohammed.

*121 There remains only the third possibility, namely, that the
*773 presentations of the Masai, the Israelites, and the Babylonians (1)
*171
174

1. The question as to which population stratum is involved here is to be left open.

/305 cont./

*121 *173 *171 174 are based on a common primeval idea, or the fourth, that those myths of the Masai originated in primeval times. We shall find the answers to these questions in the following.

*121 *173 174 178 If we consider that, after the Masai left their original homeland in Arabia, the civilized state of Egypt, with its mental life alien to the savage nomads, developed at their backs and through that cut them off from further influences from the Near East, we may probably assume that they, for whom, by persisting in their original mode of life and independence, any motive for cultural development in a new direction and for adopting alien ideas and customs was lacking, were able to preserve for us the ethnography of that common original homeland most purely and originally.

*121 The mental life of the Israelites and the Babylonians was already being led out of its old path into a new one by their becoming sedentary. The nomad thinks and feels differently than the agriculturalist, and the latter in turn is remote from the mental life of the town dweller. To a people becoming sedentary, not only the ones displaced by them, but also their already sedentary neighbors introduce /306/ new physical and -- among primitive peoples not infrequently just through this -- new psychic elements as well; through the friction and fusion of these arises the progress out of which then develops what one usually designates as civilization. Of the three peoples interesting us here the Masai are on the lowest level of this evolution, the Babylonians on the highest, and between the two poles hover the people of Israel, clinging to the old by adhering to monotheism and drawn forward toward Babel despite the polytheism prevailing there and their resistance to it, by the pressure arising or fostered owing to a stay of 400 years in Egypt and the sedentation resulting from it. Many passages in the Old Testament give evidence of the struggle and reconciliation of the two directions; yet in ideal matters the original interpretation almost always retains command, whereas in practical ones, in question of daily life, gradually the view modified by the advancing civilization, therefore principally by Babylonians influence, struggles upward and presses into the foreground (1).

1. This is reflected most clearly, of course, in the law.

/333 cont./

*121 original homeland, which, as is still most clearly recognizable among primitive peoples, has marked not only the somatic charteristics, but also the psyche of the people.

*121 304 • 174 Now, what is the situation with regard to the racial relationship of the most ancient peoples whom we know practiced circumcision? It has been determined that the tribes related to the Israelites, the Ammonites, Edomites, and Moabites, as well as the Arab tribes of the northern part of the peninsula, also observed the custom of circumcision (1).

1. According to Ploss, "Das Kind in Brauch und Sitte der Völker /The Child in the Habits and Customs of Peoples/."

We know further that the Egyptians and Babylonians practiced circumcision, and finally we now also know that all these peoples either were pure Semites or the Semitic element was very strongly predominant in them.

Now this by no means is to say, however, that circumcision was originally peculiar to all the Semites (2)

2. I found, for example, that a lineage of the Tatoga, frequently mentioned in these pages, does not practice circumcision. Besides, we know that in Egypt the common people were not circumcised.

and only to them: on the contrary, it seems foolish to try to answer the question as to the time and place of the origin of this custom, which also exists among so many non-Semitic peoples. Most probably it may indeed be that circumcision stems from a time whose history we attempt to patch together out of the finds of skeletal remains, etc. If, on the basis of the ancient Israelitish command that circumcision is to be performed with a stone knife, we may conclude that it originated in the Stone Age, one might suspect an even earlier period on the basis of the interdict that rejects the use of the reed splinter for it.

/338 cont./

*539 the Masai gives the older interpretation requires no further proof.
*773 On the other hand, the later alteration of the Biblical name is
*171 shown in its meaning of breath, for this is closely connected with
*121 the myth, only arising in more recent times, which designates Kain /Cain/ as the first murderer.

With regard to the order of succession of the three sons, it seems to me that not only what was said above about the children of Eramram-Amram applies here, but that it is also to be noted that it is not in keeping with the views of a primitive people that the eldest son and heir should wander away from his homeland and abandon the paternal property.

III.

The Masai and the oldest Hebrews originate from the same people. -- The schism in the original homeland. -- The Ameroi. -- The El eberet. -- The El eberet = Hebrews. -- Their proximity to the El dinet, who know the God Jau and the prohibition against the partaking of blood. -- The Ameroi may be the Amorites. -- The Biblical myths of the primeval age stem from the Amai people and may have come to the Israelites through the El eberet-Hebrews, to Canaan through the Ameroi-Amorites, and from there to Babel.

*121 Laws and customs can probably give only a relatively slight
• 174 chance to prove the original solidarity of the Masai and Israelites, /339/ for the latter, at the time fom which the oldest accounts about them stem, that is to say, in the tenth century before Christ, during which the Jahvist /Yahwist/ source of the Pentateuch originated, were already quite advanced in culture, and, to be sure, in a direction originally quite foreign to them. From savage nomads there had developed, even at thattime, urban dwellers of an organized state. Conversely, however, the Masai too may not have remained completely uninfluenced by the numerous peoples with whom they came in contact in the course of millenniums, in connection with which, to be sure, itis to be noted that by far the

/339 cont./

*121 174 most of these peoples were and are themselves Semites or Nigrito-Semites. The differences that we find in the customs and in the law of these two peoples should therefore not be put too much in the foreground.

*121 173 174 The situation is different with regard to the early history, the early religious tradition, and everything that is included under the designation religion; for these three things form such a closely knit, homogeneous whole that foreign elements must always remain foreign within it. Now, since we find precisely in this a complete correspondence between the Masai and the Israelites, and even among the already sedentary Israelites still see preserved the customs based on their early history or on their early religious tradition, there follows with compulsory necessity the conclusion that there must have once been a time when the two peoples were one people.

*121 173 The manner in which the schism between the two peoples occurred is reported by the tradition of the Masai, which, on account of its natural simplicity and considering the amazingly accurate preservation, in word and meaning, of the other traditions from primeval times, may probably be regarded as credible throughout, corresponding to the truth.

According to it, as a consequence of epidemics and drought, some of the Masai had become quite poor in livestock, many people had even lost all their livestock and lived as hunters. These impoverished ones, who were called 'L amerak or Ameroi, had to cover part of their subsistence by buying vegetable foods among nearby agriculturalists. They thus became dependent on them and could choose their places of residence scarcely more than a few days' march from them, whereas the still well-to-do Masai wandered from one pasturing place to another with their herds, in accordance with their ancient custom. They remained livestock nomads, while the others gradually had to become agriculturalists. The aforesaid dependence of the nomad on the agriculturalist can, in the natural course of things, only ever be a temporary state and must necessarily lead to the former's learning agriculture, for the independent production of his subsistence is the basic condition for his continuance. Now this further development, however, does not

*121 /342 cont./
173 For otherwise what reason would the lawgivers have had to state that interdict so often and emphatically as the passages quoted above show, at a time when the Israelites had already been sedentary for more than half a millennium?

*121 We find a further influence in the Israelitish god's name jahveh
173 /Yahweh/, which may have originated from the 'n jau of the El
• 174 dinet. As is already well known, jau is also the Assyrian form of jahveh, so that in this we have before us further proof of the reliability of the oral tradition of the Masai. In connection with the etymology of the word jau, it is to be said that, according to the statements of the Masai, their ancient language knew the word hau = great, which still occurs today in the Tatoga speech as 'hau. Through this it is probable that the stem of this word belongs to the original Semitic language and in it has the meaning "great," so that the god's name 'n jau in its feminine form would be translated as "the great one."

Now, according to Hommel (1),

1. Prof. Dr. F. Hommel: Die altorientalischen Denkmäler und das alte Testament /The Ancient Oriental Monuments and the Old Testament/. 2nd edition.

Ai is the oldest designation of the moon god among the western Semites, whose moon cult was almost monotheism. The, long before Moses introduced the official god's name Jahve, Ai and Jau are found as synonymous secondary forms of the name of the supreme god. Just as the god's name of the Masai, Ńg Ai, shows the feminine form, so Ai of the Babylonians was also of the female sex. Moreover, Hommel found an A—u element in Assyrian and Mesopotamian personal names and proved that this name was originally Hau.

*121 Let us now turn to the other part of the Masai people, who re-
174 mained in the original homeland, the Ąmeroi or Ąmoroi. That the Bible also gives information about them we shall be able to assume as probable from the outset, in view of what has been found before. The following seems to me to argue that we may recognize in them the Amorites of the Bible:

/342 cont./

*121
• 174

First of all there is a similarity of sound between the two names. The /343/ possibility of the identity of the two names is strengthened by the cuneiform designation for the Amorite people. In the Omina tablets, which stem from the period around 3000 B. C., the lands of Syria and Palestine are called Amurrû, and the letters of Hammurabi show that originally a people was designated with this word, [illegible]d, to be sure, the one that Assyriology has already definitely [illegible]zed as the Amorite people.

Further, the Bible, in 1st Moses /Genesis [illegible], reports that Abraham concluded a war alliance with th[illegible] of the Amorites. One should indeed note: Abraham, "domiciled" as a herd nomad at Ur in Chaldea, concluded an alliance, on his wanderings, with the Amorites settled about 1000 kilometers away in Palestine. First of all, such an alliance presupposes a community of like or similar interests. Now Abraham, however, is still a nomad, whereas the Amorites are already sedentary (it has already been conjectured above that the Ameroi must have become sedentary before the El eberet). We still have the same relationship today between sedentary Wakuafi and nomadic Masai; despite the difference in their way of life, there is a close community of interests, for the Masai who has become sedentary, just like the nomadic one, has no concern other than the preservation or, more accurately, the increase of his property in livestock, a goal that goal is served precisely by war. Work in the fields does not trouble him, but rather is a matter for the women, and, to be sure, primarily those who were captured in war for this from agricultural tribes.

Further, however, we may also unhesitatingly conclude from the existence of the pact, in view of the national-exclusive position of the people of Israel, that there was a national community, even though outwardly loose, nevertheless still existing in the feelings of both parties. It would be directly contrary to the character of the Masai to enter into any -- seriously intended -- alliance with a people belonging to the El mgg. For the alliances concluded in later times by the Israelites with other peoples, what was intended for the ones still living in a state of savage warlike nomadism at the time of Abraham need no longer apply.

/343 cont./

*121 • 174 Unfortunately, Oriental research still knows practically nothing about the Amorites, or at least not much more. We do not know what somatically different peoples participated in the formation of the historic Amorite people, and we are not familiar with either their ethnography or the manners and customs characteristic of them before they were absorbed. Not until research has thrown light upon this shall we have more detailed knowledge, for the time being we can only surmise. Now my surmise on this subject is that the ʕmeroi as they became sedentary became an essential part of the Amorites, to whom they also gave their name. The other constituent part of the Amorites was -- as is surmised -- blond-haired and of Aryan origin, and probably also significantly surpassed the Semitic ʕmeroi in numbers. The fact that the Amorites, however, were named after the latter and not the former /344/ will not surprise us if we consider that the people of the same race as the ʕmeroi, the El eberet-Hebrews, and the Semitic Babylonians were given that name, and that the Hebrews too, despite their 95 per cent non-Semitic blood, were always called Hebrews (and Israelites) and never Hetthiter /Hittites/.

*121 773 174 Now, if it is correct that the Masai, the Hebrews, and the Amorites, descended from the original Amai people in the aforesaid way, the following is shown with regard to the origin and migration of the Biblical myths coming under consideration: The myths stem from the original Amai people, who passed them on directly to their descendants, the present-day Masai. Through the El eberet-Hebrews, the oldest constituent part of the Israelites, they came to the latter. The ʕmeroi-Amorites, who first became sedentary in Kanaan /Canaan/, subsequently brought them, through their immigration, to Babylon, where the part of them that could be inserted into the astral cult prevailing there was preserved. This assumption may satisfactorily explain the form of the reports of those myths found in Babel: of the original accounts the images, the external forms, are preserved, whereas the spirit of the 'Ng ai-Jahve religion originally animating them was driven out by the one of the Babylonian state religion, which is represented as an astral cult planted on the shamanism of the Sumerians.

114 184 Consequently one must specify which Masai he is speaking of, where, and when; it is not valid to generalize about "the Masai."

History

121 Man is the ecological dominant, therefore knowledge of human history of an area is basic to understanding of its ecological history. For this reason I have gone into the history of the Masai in some detail.

174 Before 1800. The early history of the Masai has been discussed by a number of writers. Among the important works are those by Fosbrooke (1948, 1956), Gower (1948), Grant (1954, 1957), Hollis (1905), Leakey (1930), Peters (1891), Sanford (1919), Simon (1962), and Thomson (1885). The following summary is drawn from these writings.

[144] The Masai are considered to be of Nilo-Hamitic stock. It is believed that about 400 years ago they occupied a lowland country north and west of Lake Rudolph in northern Kenya. According to their own traditions they (subsequently) occupied a country called Kiaru which must have been the Rift Valley between Lake Rudolph and the Kenya Highlands. This area lies about

174 160-200 miles airline north of Western Masailand, and
174 it is a desert at present. A tribal elder called
173 Masainda found a way to climb the escarpment at the south
of Kiaru and some of the tribe then moved into the Kenya
(174) Highlands. The legendary Masainda had six sons who
became the founders of the present six Masai clans.

The tribe gradually moved south. At Mpong,
near Nairobi, according to their traditions they
found a Heaven-born child who became their first Laibon
174 or Medicine Man (Mollis, 1905). Foxbrooke (1948)
dated the arrival at Mpong at 1640 on the basis of the
genealogy of the Laibons founded by that legendary first
child. During the next 150 years the Masai moved over
300 miles airline southward.

131 <u>1800-1850</u>: By 1800 a few Masai had made what
175 proved to be the tribe's maximum penetration into
Tanganyika but it was not until about 1850 that they
had completed their occupation of what is now the Masai
Steppe in Tanganyika (Fig. 1). [1] There had been constant
warfare and raiding involved in this settlement, and the
margins of Masailand fluctuated somewhat. For a time
the Masai occupied the area immediately south of the
Ngorongoro Highlands, as well as lands near Mt.
Kilimanjaro and Mt. Meru that are now in other hands.

[1] [See p. 9n.--Analyst]

12:Dundas G-5 (ca. 1900) 1908 F L6 Dorobo F L6 Kikuyu F L10 Masai F L12

also amongst them, and it is not difficult with a little practice to tell the particular division to which a Kikuyu belongs. Thus the people of Ichichi* have pronounced Masai features, and many of their chiefs are pure or half Masai by birth. This is due to the fact that when the Kikuyu invaded that district about forty years ago they found it occupied by the remnants of the Alkipiek and Dele-le-kutch Masai, who owing to famines, raids, and other causes were too much weakened to resist them. The two tribes therefore settled down peacefully side by side, and by intermarrying formed one people.

Again, many of the Kikuyu clans claim descent from certain particular tribes; thus, the Anjiro and Chakamaya clans say they are descended from the Sisoka, the Akhachiko and Achuro from the Kamba, the Aumba from the Chaga of Kilimanjaro. Anyone enquiring into the descent of those present at a meeting of Kikuyu elders will find an extraordinary number of different tribes represented. One is a Maura, another a Chaga, a third a Masai, a fourth a Sisoka, a fifth a Dorobo, and so on.

The actual Kikuyu themselves are said to have come from two tribes called the Ilengiroto and Ngumba, both of which still exist as tribes somewhere beyond the Maura country, north of Mount Kenia.

I cannot speak from experience of the Ilengiroto, but I have met a native of Ngumba whose appearance reminded me strongly of a Kikuyu. This man, who said he had never seen a white man before, told me that his country lay beyond Maura and that he had come here to visit relatives. These same Ngumba are believed to have been originally Dorobo, and Kenori, one of the paramount chiefs of the Kikuyu, who is himself a Dorobo, claims descent from them. The Ngumba of the present day are probably analogous to the Kikuyu, *i.e.*, they are a mixture of Dorobo and some other tribe or tribes.

Many absolutely foreign tribes have had colonies in Kikuyu for shorter or longer periods. A tribe of exact people called Digo are stated to have lived for many years on the Tana River, in what is now known as the Fort Hall District.† Somali, Galla, Swazi, or some other similar people effected a very strong footing in Kikuyu some fifty to seventy years ago. According to tradition they belonged to the Bandei Lekolale, Sigiri, and Endamaroni clans,‡ and they had settlements at Nyeri, Naivasha, Kijabe, Fields Mile, and generally all over the Kikuyu country.

In those days the Alkipiek Masai occupied the Lelkipia Plateau, the Purko Masai were at Naivasha, the Kaputei in the Kedong Valley, and the Tarosero at Ichichi. The Dorobo, who were still the dominant tribe, occupied with the Kikuyu the present Kikuyu country.

With all these tribes the Somali or Galla lived in a state of chronic warfare.

The Lawana, a Kikuyu clan, and the Aiwa, a Dorobo clan, unable to hold out any longer, migrated. The former have, it is said, preserved to this day their tribal identity and customs, and are still to be found somewhere in the vicinity of Kilimanjaro§; the latter near Mombasa.‖

The remaining tribes appealed for assistance against their oppressors to a great medicine man called Sogi (or, to give him his correct name, Sogoti), the grandfather of Lenana, the present Masai chief.

---

* The name Ichichi is said to be derived from Ichichiro, a kind, say Tarosero women. Tarosero is the name of the most important clan in this particular section of the Masai.

† Mr. Sidle informs me that the Sagala, who have intermarried with the Digo, a sub-tribe of the Wa-Syba, have a tradition to the effect that they once lived on the Tana River.

‡ Similar to the Kikuyu, Ogiriaki the Masai for Somali and Galla.

§ Possibly the Aumba, who live on Mount Meru in German East Africa.

‖ By Mombasa the up-country native chiefs mean the coast generally. According to Mr. Sidle the Wa-Kenya call themselves, and are known to the Galla as, Warera, sing. Waryo.

12:Dundas G-5 (ca. 1900) 1908 F1A Dundas F1A
K-Kavu F1.10
Magai F6.12

Engi is said to have instructed the Dundas to bring him a pair of sandals made of leather having hair on both sides, the Masai to bring him a bell, the dung of which was pure white, and the Elkaya an animal called Hako (a burrowing rat or mole).

The Dundas cut off the ears of a donkey, and produced them as the required sandals before Engi; the Masai brought a bell fed on milk only; and the Elkaya the animal called Hako.

Engi then told each tribe to take his respective chosen and to smack the enemy separately and at different points.

The Masai, smacking into Elkaya from Kaiwaka, fell upon the youngest son, and taking all their stock drove them on to the Elkaya, who in their turn drove them on to the Dundas, by whom they were finally seized.

The Masai or Galla were then dispersed off, and only by the cause Engi, which was given to the generation that fought with and expelled them, and by a few women of their tribe, taken prisoners by the Dundas, are we reminded of their sojourn in Elkaya. Amongst these prisoners may be mentioned an old woman called Bandita, who is still alive and resides in one of Bungi's villages. She was formerly Chief Karari's wife.

Needless to say the Masai kept all the cattle which they captured, and this caused a rupture between them and the Dundas and Elkaya, who joined forces and waged war on them.* After a space had been made the Dundas and Elkaya fought amongst themselves.

If the Elkaya were to live and increase they had to cultivate the ground, and to do so they were obliged to destroy the forests. The very existence, however, of the Dundas depended on the preservation of the forests, and hence arose a struggle for survival, which ultimately of no compromise and could have but one end.†

In an incredibly short time the great primeval forests, the home of the Dundas, were destroyed, and with them this interesting people ceased to exist as a tribe. Deprived of the means of living, many died, some took to cultivation, whilst the majority migrated to other regions, where they formed small colonies, such as are to be found at Bungi, Kaiwaka, Sorian, Kijabe, on Lekipia and Mau, or Tarana, in German East Africa, and even, it is said, in places as remote as Kimanya—(the chief that went to this last place was the Agorobi). This scattering of the tribe accounts for the peculiar fact that Dundas living in widely different localities speak the same language.‡ The Bungi, Kaiwaka, Kijabe, and Sorian Dundas, and those of similar colonies with, if questioned, as to where they come from, usually mention Kaiwaka and Kaiwaka as the birthplace of their fathers.

As regards the origin of this interesting tribe, we know little or nothing. They appear to have been two branches, the Agorobi and the Ghiki; the former hunted the game on the plains, the latter in the forests. They lived in pits dug in the ground and covered over with leaves of the wild banana; these pits may be dug they be seen anywhere in the Elkaya country, though of course they become less numerous the nearer one approaches the forest. They are also said to have buried their

* The first Elkaya to come into the country appear to have been almost without exception peasants, and they accordingly did not interfere at all with the Dundas. The later arrivals, who came to have gradually less stock, gradually from individual Dundas the right to certain places of land to farm. For some reason or other just about the time the Masai or Galla were driven out, a sudden very pressing demand for grain appears to have arisen amongst the Elkaya; this may have been due to one of two causes—the Elkaya may have lost through sickness a large amount of stock, or there may have been just at this time a sudden influx of agricultural natives.

† Masai. (In addition can be made with Masai speaking tribes, the younger generation is rapidly forgetting this language.)

‡ The country lying between the Brown Bear and Bedayan in Elkaya

FL12 Masai FL12

174 A tribe coming from the north like the Masai, and possibly at one time in touch with races influenced by ancient Egypt, may conceivably represent not an improvement of the primaeval African stock but a degeneration of some other race. Still, the accounts which we have of the Bari and Dinka ascribe to them the same vague belief in a supernatural power, which most inquirers have reported as existing among the Masai, and an absence of traditions respecting the origin of the human race[1].

175 The history of the Masai, as far as we know it for the last hundred years, presents as its most important feature a conflict between the pastoral and agricultural sections, ending in the victory of the former and the annihilation of large settlements of the latter. The conflict was disastrous for the race, for the portion which survived depended entirely on cattle and raiding for subsistence. The herds suffered severely from plague in the eighties, and the advent of Europeans and the gradual introduction of the Pax Britannica could not be otherwise than unfavourable to the pre-eminence of a tribe whose prosperity depended so largely on continually plundering their neighbours. Nevertheless from at least 1850 to the early eighties the pastoral Masai were a formidable power in East Africa. They successfully asserted themselves against the Arab slave-traders, took tribute from all who passed through their country, and treated other races, whether African or not, with the greatest arrogance. About 1859 they raided Vanga, on the coast near the present German frontier. Thomson (*Through Masai Land*, 1885) describes how, in 1883, they entered his camp and ordered about the whole caravan, including himself, as if they had been masters and the travellers slaves. This period of triumph was succeeded by one of disaster. Rinderpest attacked the cattle and small-pox human beings. The surrounding tribes who had suffered from their raids were not slow to revenge themselves for the oppression and plunder of the past, and a severe famine completed the catalogue of misfortunes. The numbers of the Masai were undoubtedly greatly reduced, and at present those found in British East Africa only amount to a very modest figure, variously estimated at from 25,000 to 12,500. The latter estimate, which is the latest and perhaps the most correct, is based on the assumption that there are 7,500 in the

[1] See Wilkinson-Bey, *The Dinka Speaks*, 1906, p. 98, &c. It is true that some expressions ascribed to the Dinka, such as 'We do not know—the wise men know,' might be interpreted as a consciousness of the loss of traditions.

Naivasha province and 5000 between Kikuyu and Kilima-Njaro. 161 175

The expansion of the tribe seems to have come to an end about the middle of the last century. About 1830 they reached their furthest recorded point in the south and were driven back by the Wagogo and Wahehe. The southward movements of the Gallas and Somalis kept them back on the north-east, though as late as the nineties they raided on the Tana river. It would appear that about 1850 the Turkana drove the most westerly branch of the Masai from the west to the south of Lake Rudolf, where they are now settled. Somewhere about the same period—at the time an old man can remember according to the native expression—the Masai dwelling on the Uasin-Gishu plateau attacked those of Naivasha, and after defeating them were in their turn thoroughly defeated by a combination of Naivasha and allies from Kilima-Njaro. The inhabitants of the Uasin-Gishu were scattered to the four winds: those who escaped their brethren were annihilated by the Nandi, and only a few fragmentary remnants survive in Kavirondo, Lumbwa, and the two villages called Great and Little Enjémusi at the south end of Lake Baringo. Another branch called 'L-Oigella or Segelli took refuge in the Nyando valley but were wiped out by the Nandi and Lumbwa. The Laikipia plateau, which is now uninhabited like the Uasin-Gishu, was not depopulated in 1889, when Peters crossed it and had many fights with the Masai. According to one story, the people of Laikipia raided some other Masai near Nairobi about 1890 and carried off their cattle. These cattle were suffering from rinderpest, and the result was that all the stock of the Laikipia took the disease and died. This was considered as a judgment on the Laikipia for raiding their brethren.

175 648 [361] [731]

At present the agricultural Masai are found chiefly near Lake Natron and south of Mount Meru in German territory. In our Protectorate they are represented only by a few scattered settlements, such as the people of Enjémusi, the Burkuneji, and perhaps the people of Samburu in the Rendile country. It would appear that the name Wakwavi, often applied to the agriculturalists, is merely a Swahili nickname borrowed from the Masai Kwayi or Kwapi, meaning pieces. The pastoral section classify themselves under five districts, with many subdivisions, namely Kapotini (Kapite plains), En-aipusha (Naivasha), Kisongo (the district south and west of Kilima-Njaro), Uasin-Gishu, and 'L-Alkippyak. The two last districts, as mentioned, have ceased to exist, and those who

Kake tjo kulikae: 'Mua el-oiboni lafg elie, anu etaie-[628] jiaka.' Nepwo ninje sasij Sendeu.

Now Mbatian was very aged and he had only one eye. He therefore did not see which of his sons was before him and gave to Lenana the insignia of the medicine-man (the iron club and the medicine horn, the gourd, the stones[1], and the bag), at the same time saying: 'Thou shalt be great amongst thy brothers and amongst all the people.'

Lenana took the medicine-man's insignia and went away.

Sendeyo then went to his father, but was told that his brother had already been there and been given the medicine-man's insignia. When he heard this, he was very angry and said: 'I will not be subject to my brother; I will fight with him till I kill him.'

Mbatian died and was buried near Doeyo Erok.

When he was dead, some of the people proclaimed Lenana principal medicine-man, 'for,' they said, 'Mbatian told us that he would give the insignia of his office to whichever of his sons he wished should succeed him.' They therefore remained with Lenana.

But others said: 'We will not acknowledge this man for he is a chief,' and they threw in their lot with Sendeyo[2].

[1] It is possible that these stones, which according to tradition were brought many years ago from the north, may prove to be of some interest. It is asserted that no European has ever been allowed to behold them.

[2] This is the story as told by the Masai. The official version is that Lenana was chosen by the elders of most of the clans and districts on his father's death, but that Sendeyo refused to acknowledge him, and was

supported by the 'L-oitai (i.e. the Masai of the 'L-oita sub-district, near Kilima Njaro), with whom he lived for many years. The warriors of the two parties frequently met in deadly strife, and raided each other's cattle. In 1902 Sendeyo gave up the hopeless conflict, and agreed to acknowledge his brother as chief. He now lives not far from Naivasha. Lenana himself says that he and his three brothers Sendeyo, Nellang, and Tolito were circumcised by their father a short time before the latter's death, and as he possessed a better knowledge of the work of the medicine-men than his brothers, he was given the iron club, &c., and chosen by the elders as Mbatian's successor.

[1] On one occasion the iron club was lost. A messenger was sent by Lenana to the Government authorities at Nairobi, and when crossing the Uganda Railway he was overtaken by a train. He jumped on one side and saved his life, but dropped the club, which was never found again. Its place was taken for some years by a small iron poker, but another club has now been made.

On the whole, those two authorities stress the linguistic unity of all the Masai. 197

The great majority of the Masai are pastoral, only very few tribes having taken to agriculture. The pastoral tribes follow a semi-nomadic way of life. "They move", writes Lord HAILEY,[3] "with their herds in order to avail themselves of the seasonal variations in water supplies, so that in effect they practise a system of rotational grazing". The same writer,[4] reports "a recent estimate" of Masai herds in Kenya which puts "the number of cattle at over 700,000, with 800,000 sheep and a large number of donkeys". For Tanganyika he gives no figure. The above estimates show clearly enough how the attitude of the Masai to cattle is a paramount feature of their life. To own cattle is a privilege obtained through initiation, and large herds are a sign of outstanding social status. Cattle are the main economic interest and investment for the Masai.[5] 233 [221] 181 233 554

The total population of all the Masai may be reckoned at about 122,792. The 1948 census of Kenya's population (see Bibl.) gives for the Samburu an estimate of 20,000, and the following figures: Njempe 3,423, the other Masai 67,201. In 1931 the Tanganyika Masai were reckoned as 32, 168. 162 [161]

* * *

Under the present political situation, the Masai are not administered as a single unit, for they are divided into two sections by the border of Tanganyika Territory and Kenya Colony. 631

In Tanganyika the Masai form one of the four districts of the Territory's Northern Province (the Masai District). In Kenya the main group inhabits the reserve adjoining Tanganyika Masai District, and constitutes the Extra Provincial District (Masai District) of the Colony. The other group (Samburu and Njamusi) is incorporated with the Rift Valley Province (Samburu and Baringo District), and partly with the Northern Frontier Province. The geographical separation of the Samburu from the other Masai is the reason why the Samburu were considered, and are still considered, as a non-Masai tribe. But, as BRYAN remarks, they are true Masai. The splitting of Masailand and the separation of the Masai were made 631 634 [101] 175

175 permanent by the present administrative arrangement, but were not established by it. The land which divides the Samburu in the north from the Kapiti in the south of Kenya, was once the home of the Laikipiak and the Uasin Gishu Masai. In those days, Masailand was a continuous strip of land stretching over the plains south of Mt. Kilimanjaro and Mt. Meru up to the shores of Lake Rudolph. At the end of 19th century a great cattle plague and, even more, civil wars (the Kapiti versus the Laikipiak and Uasin Gishu) wrought havoc among the latter, who were almost destroyed. The few remnants have been absorbed by other Masai tribes, especially the Kapiti and the Kisongo. The Laikipiak plains west of Nanyuki which in 1904 had first been set aside as a special reserve (the Northern Masai reserve), were subsequently declared open to European settlement, and by 1911 Agreement the Southern Masai Reserve was enlarged into what is now the Extra Provincial District of the Masai in Kenya Colony.[6]

[131] [133] [669]

* * *

631 A comparative analysis of the literature shows the existence of three graded territorial units, the major and the minor territorial sections, and the village. A character common to the first two sections is the absence of a clear limit or boundary. The sections are spoken of in terms of watering and grazing rights. The nomadic aspect of Masai life is chiefly responsible for this territorial vagueness. The absence of any centralised authority to check people and cattle's transhumance is another important cause of the vagueness of Masai territorial organisation.

630 101 619 The major territorial section is made up by the area in which the movements of a full tribe usually take place. The existence of

[6] SANDFORD, *An Administrative and Political History of the Masai Reserve*, London 1919, Appendix; *K. L. C. E.*, p. 183. One may note that the Uasin Gishu and the Laikipiak, together with the Siria and the Lumbwa were despised as inferior, for they were not considered as "pure Masai" by the other tribes who regarded themselves as descendants of Masinda. See FOSBROOKE, p. 7. This ill-feeling may explain in part, the fury with which the Kapiti fought against the Laikipiak and the Uasin Gishu.

[186] In December 1960, I visited the Ndigiri Dorobo at Dol Dol on the Mukogodo Hills, some 60 miles north west of Nanyuki. They claim to have been dependent on the Laikipiak Masai, and they survived the slaughter thanks to their seclusion in the forests. Their present outlook seems to be entirely Masai. The names of their age-classes are consonant with those of the Masai.

clansmen frequently meet on the water, and other matters — marriage, debts, etc. — come up for settlement before the tribunal". Clan ownership does not exclude individual ownership, which is integrated by the former as a sort of higher supervision. The point is that no clan property must be passed over to other clans without the owning clan's approval. HOBLEY,[29] states that cattle used to be marked by a clan brand showing clan-possession, and sometimes by a brand of the individual owner.

614
677
683

The corporate bond arising from clan relationship is confirmed by cases of murder compensation. Even if a murderer is a wealthy man, and might pay all the compensation out of his own stock, "the other branches of the clan would still contribute and they would pay their share". However, "if a Masai kills a member of his own branch of the *gilat* he pays compensation himself, and the other branches do not contribute".[30] LEAKEY, on the other hand, was told by his informants that no compensation is expected when a man kills a member of his own branch. They say: "what would be the use of taking a fine from one's own sub-clan?"[31] HOBLEY reports further that "each branch of the *gilat* to whom the murdered man belongs, receives a share of the compensation: 2-3rds to the murdered's father", and the rest is distributed among the other elders of the clan.[32] This is also confirmed by the notes of MAGUIRE on the penal code of the Masai.[33]

614

One should note that the corporate bond formed by clan relationship is of a particularist nature. It ties members to their own clan in opposition to other clans within the same tribe.

* * *

648
642
175

The many efforts of the Administration to identify a native political institution for local government make a very interesting piece of etnographical history. First in Kenya, and also, after 1918, in Tanganyika, one *laibon* was recognized as the Paramount Chief of the Masai. In Kenya such an office was abolished in 1918, while a graded system of councils was introduced: a Central Masai Council, 14 Native Councils and local Headmen. They acted as tribunals,

2: Bernardi E, M-4 (no date) 1955 FL12 Masai FL12

the Central Council being the Appeal Court. In the thirties, the system was again modified, and there are now two regularly constituted tribunals in each of the two Kenya Districts, Narok and Kajiado, in the Masai reserve, and an Appeal Tribunal in each district. In Tanganyika changes came later. Only in 1938 the Paramount Chief was abolished and a new system introduced. There is now a Masai Council, acting as the Appeal Court from the six Local Courts established under the authority of a Headman. Lord HAILEY, commenting on the Tanganyika system, remarks that "the whole of the juridical organisation seems on a tentative basis, and in practice it functions irregularly, owing to the nomadic habits of the people". This is more or less true also for Kenya. It is a fact that, in Kenya and Tanganyika, the Masai never accepted the authority of the *laibon* or prophet in terms of Paramount Chief, and that they dislike the idea of a formally established court.* Nomadism, as Lord HAILEY points out, has much to do with this attitude of the Masai, but it is their social structure which has no place for such institutions. Whatever political authority exists among the Masai, it is established on the structural basis of the age-system. This system has a dynamic character which can hardly be reconciled with the rigidity of any administrative system imposed from above by the Government.

The institution of the Masai prophet has been described by FOERNOOKE, p. 13. He distinguishes three types of *laibon*. "First there is the private practitioner who, for suitable remunerations, will perform such service as curing sickness, removing barrenness and ensuring fidelity in wives. He is only consulted by individual patients. The next stage is when a private practitioner has acquired such a reputation that he is consulted by a deputation on behalf of a group of Masai, and provides charms and lays down a ceremonial to be utilised to the advantage of the whole group. Such prac-

* Writing of the Native Authority System in Kenya after 1918, Lord HAILEY says in *Native Administration in the British African Territories. Part I — East Africa: Uganda, Kenya, Tanganyika*, London 1950, p. 171, "these Tribunal were not generally recognised by the Masai who preferred that such *issues as arose between them should be settled* in the customary manner by the Headman or Elders". And with regard to the new development he notes, p. 176, that "the preference for referring cases to the arbitration of local headmen or elders persists". He makes a similar comment for Tanganyika on p. 204: "in the Masai District the majority of the issues arising between the tribesmen are settled by arbitration".

"The expansion of the tribe," writes Sir Charles Eliot, "seems to have come to an end about the middle of last century. About 1850, they reached their furthest recorded point in the south, and were driven back by the Wagogo and Wahehe . . . . . About 1860, the Turkana were the most westerly branch of the Masai from the west to the north of Lake Rudolf . . . . . Somewhere about the same period . . . . . the Masai-dwelling on the Uasin Gishu plateau attacked those of Naivasha, and after defeating them were in their turn thoroughly defeated by a combination of Naivasha and allies from Kikuyu-Njoro. The inhabitants of the Uasin Gishu were scattered the four winds: those who occupied their heathen were annihilated by the Nandi, and only a few fragmentary remnants survive in Kavirondo, Lumbwa, and thrwo villages called Great and Little Sugoroni, at the south end of Lake Baringo. Another branch called L-Gugulia, or Sogoli, took refuge in the Nyandu valley, but were wiped out by the Nandi and Lumbwa."

Early history of the Masai

The same writer says:—" From at least 1800 (also early eighties, the pastoral Masai were a formidable power in East Africa. They successfully asserted themselves against the Arab slave-traders, took tribute from all who passed through their country, and treated other races, whether African or not, with the greatest arrogance." The record of Masai raids is much too complete as it affects the eastern part of their territory than on the west. This is readily understandable on account of the records having been made by Europeans, who obtained their information from the east coast, and not by residents from Uganda: but it also appears probable that the Masai found their expeditions eastwards to be more remunerative and less costly than any they undertook on the west, for it has never been contended that the Nandi and Lumbwa, their western neighbours, were not at any time of their history a match, ernore than a match, for the Masai. About 1800, the Masai raided Tanga: in August, 1863, they were in the Galla country near Mangaredo: and again, and in 1867, they were raiding on the Tana River, near Wachi: the Galla would retreat to Ramu in times of war with the Masai as, that place being surrounded by water, it was considered immune from Masai attack. In August, 1870, theMasai were at Kilifi, whence all natives fled to Rabai, while six years later,they again raided the same locality, on this occasion visiting the Mission station and killing two of the native converts. In 1883, they raided Bandani, on the east opposite Zanzibar, whence they were repulsed with guns, and these expeditions overlaidowed by two raids on the Mission station of the United Methodist Free Church Mission, at Gallwatti, on the Tana River, in the first of which, in March, 1880, two native Christians were killed, and in the second, on May 3rd of the same year,the two resident missionaries, Mr. and Mrs. Houghton, shared the same fate. As late as 1888, the Masai raided within sight of Mombasa Island. The result of the constant raids was that all inhabitants were driven from the more exposed portions of the coast belt, that the Giriama were prevented from keeping cattle herds, and that Galla settlements on the southern Tana totally disappeared.

The same raids as Tanga

Probably the first European who made the acquaintance of the Masai, was Mr. Johnston, the colleague of Dr. Krapf, who visited Chagga country on three occasions, and Dr. Krapf, who himself travel to Ismailia in 1849 and 1848, gave a description of "The Wakwafi and Masai Tribe" in his book "Travels, Researches, and Missionary Labours, &c.," published in 1860. The following extracts are taken from this description as giving a early impression created by the tribe in the mind of the European traveller.

Johnston visits in Chagga country

Dr. Krapf

"The Wakwafi and Masai," writes Dr. Krapf, "are call themselves 'Orlolobik,' or 'Lolbik,' 'Ingolo,' . . . . . that is, possessors of the land. . . . . occupy large plains in the interior of Eastern Africa, which extend from about six degrees north of the Equator to about four degrees south of it. The names 'Wakwafi' and 'Masai' are given them by the tribes of the coast. . . . . Their manner of life is nomadic, and where they find water and grass, there they encamp often for months together. They live entirely on milk, butter, honey, and the meat of their cattle, goats and sheep, and on the grass which they beat down, having a great disrelish for agriculture, believing that the cultivation

Dr. Krapf's description

[101]

[195 *148] affected by cereals exhibited, and is only suited to the despised tribes of the mountains: while to feed on meat and milk gives strength and courage. When cattle fail them they make raids on the tribes which they know to be in possession of herds. They say that Engai (Heaven) gave them all that exists in the way of cattle, and that no other nation ought to possess any. Wherever there is a herd of cattle, thither it is the call of the Wakuafi and Masai to proceed and seize it. Agreeably with this maxim, they undertake expeditions for hundreds of leagues to attain their object, and make forays into the territories of the Wakamba, the Galla, the Wajaggs, and even the Waniika on the sea-coast. They are dreaded as warriors, laying all waste with fire and sword, so that the weaker tribes do not venture to resist them in the open field, but leave them in possession of their herds, and seek only to save themselves by the quickest possible flight.

[811] "The weapons of the Masai and Wakuafi consist of a spear, a large, oblong shield, and a club round and thick at the top, hurling which with the greatest precision, at a distance of from fifty to seventy paces they can dash out the brains of an enemy: and it is this weapon, above all, which strikes terror into the East-Africans, the Swahili with their numbers not excepted. The Wakuafi shelter themselves behind their long shields until they become close enough to the enemy to make good use of their clubs. They conquer or die, death having no terrors for them. . . . . .

[961] "The two kindred tribes, the Wakuafi and the Masai, hate each other mortally, which is a fortunate circumstance for the weaker African tribes: since, were they united and ruled by one supreme head, there would soon be an end to the existence of the other East-African tribes, who could not possibly resist them, the savage Galles themselves not excepted: for the latter fly before the Wakuafi and Masai, and, at the most, only prove dangerous enemies to them by stratagem and running, but never cope with them in a fair and open field.

"As regards the physical conformation of the Masai and Wakuafi, their forms are tall and slender, with handsome and rather light-complexioned features. . . . . From their beauty of form the Masai and Wakuafi slaves, especially the young females, are much sought after by the Arabs and Swahili of the coast; and they become much attached to their Mohammedan masters, provided always, that the latter do not require from them any kind of labour which is repugnant to their habits, such as tilling the soil and similar occupations.

"The Wakuafi and Masai as pastoral tribes, consider themselves the exclusive possessors of the plains and wildernesses, with their springs and rivers, and they do not attack the inhabitants of the mountains, so long as they confine themselves to their mountains, and refrain from descending into the level country to turn it to agricultural or pastoral purposes. It is said, however, that very recently, they have resolved to take possession of the mountain Kadiaro* to facilitate their freebooting expeditions against the Galla, Waniika, and Swahili, and to exclude those tribes of the coast from access to the interior. . . . . ."

Discovery of the source of the Nile

The Masai first came into prominence in connection with the development of Africa and with geographical discovery by the discovery of the source of the Nile in 1858 and by the interest then aroused in Europe, both in Uganda and in the possibilities of opening up a more direct route from the sea than that one then in use from opposite Zanzibar to the northern end of the Victoria Nyanza. To the opening of this route the most serious difficulty to be overcome was the occupation of the country occupied by the then formidable and dreaded Masai, of whom practically all that was known was the rumour of their bravery and prowess in arms. East coast traders had repeatedly crossed Masailand, but no European had attempted the task.

Dr. Fischer and the Masai

In 1882, a German naturalist, named Dr. G. A. Fischer, was sent out by the Geographical Society of Hamburg to explore the possibilities of this route. He started from Pangani, opposite Zanzibar, with a caravan of 130 natives and porters,

* Mount Kenia known as Kirinyaga

and, on reaching the borders of Masailand at Little Aruwha, was attacked by some of the Masai. These were beaten off, and the expedition advanced as far as Lake Naivasha, which was reached on the 11th of May. There the Masai stubbornly opposed his further progress, and after a stay of nearly four weeks in that neighbourhood, he was forced to return to the coast.

175
648

About a year later, the feasibility of the route was fully demonstrated by Mr. Joseph Thomson, who was sent out to East Africa for the purpose by the Royal Geographical Society, and the account of whose adventures is given in full in his book ("Through Masai Land," Sampson, Low and Co., 1885).

Mr. Thomson's journey through Masailand.

Mr. Thomson, with his caravan of 140 men, left Mombasa in March, 1883, and travelled by way of the Church Missionary Society's station at Taita to Tavetta and the eastern slopes of Kilimanjaro. On attempting to enter the Masai country, he found them so hostile that he was compelled to return to Tavetta, where he joined forces with a body of Arab ivory traders. The caravan being now too powerful to fear attack, he proceeded to Ngongo Bogas, being subjected to much annoyance and many indignities by the Masai. Arrived at Naivasha, he found the Masai very troublesome, and had great difficulty in moving, as he desired, towards Kenya over Settima, the highest point in the Aberdare Range. He found the Masai in great force on Lekipia, and further difficulties beset him, his supplies of food and trade goods giving out. He records a terrible epidemic of rinderpest which had recently broken out, decimating the Masai herds and rendering it impossible to procure food. Finally, he was forced to "fly in the middle of the night," and he escaped towards the southern part of Lekipia, arriving at Ngongo early in November. From there he proceeded without much difficulty to the Victoria Nyanza, at a place forty-five miles east of the outlet of the Nile. Thomson was thus the first explorer to cross the whole width of the Masai country and reach the Victoria Nyanza from the east.

The third great expedition across Masai country was undertaken by Count Samuel Teleki von Szek, who was accompanied by Lieut. von Höhnel, and who left Zanzibar in January, 1887. He passed by Kilimanjaro, crossed the Kapetei Plains, reached Ngongo Bogas in August, and moved northwards to Lake Rudolf. This expedition was important, on account of Count Teleki having twice crossed the Masai country without conflict with the natives.

Count Teleki's expedition.

No encounter with the Masai occurred on the occasion of Mr. (now Sir Frederick) Jackson's journey towards the Victoria Nyanza in the autumn of 1888, but Dr. Carl Peters, who followed a route further to the north, met there on Lekipia where an engagement took place, two Somalis and one Swahili being killed from among his followers. An account of this latter journey is given in Mr. F. L. McDermott's book, "British East Africa or Ibea" (Chapman and Hall, 1893), from which the following is a quotation from a narrative related by one of Dr. Peters' Somali followers:—

Mr. Jackson's journey.

Dr. Peters.

"The Masai at this place (Lekipia) had large herds of cattle, goats and sheep, and we carried all the goats and sheep away with us, but had to leave the cattle behind, being too wild to drive. There would be about sixty of us in the caravan at this time. In the conflicts at this engagement, nine of the Wa-Elkoyo escaped. These Masai followed our caravan for two days, but our Askari kept them away by firing at long distances. On the third night they came down on us but were repulsed.

"We had another engagement at a later period, and lost one Swahili."

Dr. Peters' methods may not commend approval, but it would appear that the Masai, who were accustomed to attack whatever caravan they met, received from him a wholesome lesson as to the efficacy of the modern firearm, a lesson which they were ready to remember in their subsequent meetings with European caravans.

Peace and modern firearms.

The year 1890 may be said to mark the commencement of the decline of the power of the Masai. The western portions of Uganda, the highlands of the Sabaki River, the plains of Chambani, and the neighbourhood of Mount Kenya were all

Decline of Masai power.

175
#L48

visited in that year. A graphic account of a Masai visitation to the country east of Mount Kenya is given by Commander Dundas, R.N., in the "Scottish Geographical Magazine" of March, 1908. Commander Dundas navigated the Tana River to a point 300 miles from its mouth in the early nineties, and then proceeded overland towards Mount Kenya.

A Masai raid.

"On our return," he writes, "through the Ithe country, a most harrowing sight presented itself; what only a few days before were prosperous villages, standing amid fields of grain, were now smoking ruins; bodies of old men, women and children, half-burnt, lay in all directions; here and there might be seen a few ordinary individuals, sitting with their heads buried in their hands, hardly noticing the passing caravan, and apparently in the lowest depths of misery and despair. On questioning several of these unhappy beings, I was informed that the Masai had unexpectedly arrived one morning at dawn, spearing and burning all before them, and carrying off some 200 women and large herds of cattle. Only a few of the unfortunate people had escaped by flying to the mountains."

Cattle plague.

Smallpox.

At the end of 1890, a cattle plague started on the East Coast, opposite Aden, and spread inland. In the spring of 1891 it had not reached the Masai country, but by the autumn of that year it had spread through Ukambani and Uganda and the majority of cattle and buffalo were dead. Simultaneously, the Masai were attacked by smallpox and their numbers considerably reduced. The cattle plague forced their occupancy and largely deprived them of their means of subsistence and the subsequent disease found them weak and hungry and killed off large numbers. From this date Masai supremacy ceased to exist and, though the terror of their name long outlived their prowess in the court sense, the tribes surrounding the Masai country were not slow to take their revenge for the oppression and plunder they had suffered in the past, and on the advent of the Company's administrators, the Masai were in a pitiable plight.

Relations between Masai and Wakamba.

An extract from Captain (now General Sir F. D.) Lugard's diary is interesting as showing the relations of the Wakamba and the Masai at this transition stage:—"These Wakamba are at constant war with the Masai. They have sentries out along the hills and on the borderland, by day and night, I believe, so that the approach of any Masai is at once known, and they assemble in numerous numbers, almost instantaneously, to fight them. Moreover, every day little parties pass my camp (at Machakos) on their way to loot cattle from the Masai. Three or four at a time, perhaps, running further on (where they put on their war-dress). It is a daily sight, and one sees them going and returning all day long on these expeditions. Altogether, they seem to make a gamble but for the Masai about here. In turn the Masai loot Wakamba cattle, etc."

Machakos Station.

Spring.

A station was established by the Imperial British East Africa Company at Machakos in 1890, and on being sent on his mission to Uganda Captain Lugard had received instructions to build a station at Ngongo Bagas; this site, however, he found to be a more waste land, uninhabited except by passing Masai, who were in the habit of grazing their flocks and herds in that neighbourhood during the dry seasons. As the object of this station was to be the foundation of a centre for the purchase of food for caravans proceeding to Uganda, he decided to build at the southern extremity of Kikuyu, as close as possible to Mombasa, so as to get in touch with the tribe, but within the borders of the rich and fertile food-producing country, and he consequently selected Dagoretti as a suitable site, in October, 1890.

Dagoretti.

Relations between Kikuyu and Masai.

In describing the Kikuyu relations with the Masai at the time of his first visit, Captain Lugard writes:—"These people are at constant war with the Masai, who particularly visit the country in driving war-parties. The Wa-Kikuyu, however, hold their own, either surprised or attacked in compromising form. I saw along one of the main roads a series of pits concealed in the road (opposite to the side of the path), and was told that, in the event of a Masai raid, natives would conceal themselves in each of these pits, and spear the Masai as they passed."

Captain Leggard left Dagoretti on November 1st, 1890, having completed the stockade and put together some rough houses for stores and native quarters. He left in charge Mr. George Wilson with some thirty men, and Mr. Wilson, while at Dagoretti, succeeded in getting into touch with the neighbouring Masai and in extending British influence into the Masai country. This, wrote Captain Leggard, was "the first time that any Europeans had ever succeeded in winning their confidence and friendship." In April, 1891, Mr. Wilson had to evacuate the fort owing to lack of provisions and it was thereupon burnt down by the Kikuyu, who looted the stores it contained. Having collected thirty men at Machakos, Mr. Wilson returned to Kikuyu, and the Masai, with whom he had made great friends, offered their assistance. He declined it, but they would not be denied and remained close at hand to see he should meet with a reverse.

Having recaptured Dagoretti station, he took steps to rebuild the fort and a stockade was made with the Kikuyu that the Masai, who had been his staunch friends throughout, should have free access to Kikuyu country to trade. This treaty was kept inviolate for seven months.

Shortly after this, Mr. Wilson left the service of the Company and Dagoretti station was abandoned, while another station with a strong stockade was started at Fort Smith.

The Masai, who had previously behaved so well, were fired upon by the Company's troops while carrying out a raid against the Kikuyu, and confronted by the number of such men, finally abandoning their friendly attitude and becoming definitely hostile.

The possibilities of travelling to Uganda by the route traversing Masai country had been fully demonstrated by various reverses which had gathered the journey but this route had not been into general use in 1892, the Ganger had other way through the less hostile districts of German East Africa being normally used by other than Government reverses. In that year it was suggested that it might be convenient to construction and other parties if arrangements could be made for the utilisation of the more direct route to Uganda and the Company's representatives were therefore asked to get into touch with the Masai in order to facilitate such journeys. A meeting was held at Machakos near Nairobi in 1892 between the Masai and Mr. Ainsworth as the representative of the Company, when certain details regarding this route were amicably settled, the Masai assisting on their occasion by the provision of one hundred donkeys for transport work.

Though the power of the Masai had largely decreased by the year 1895, it appears that they were still considered a people to be reckoned with, for Major Macdonald, in his report dealing with the construction of a railway from Mombasa to Kikuyu, remarked:

"The most hostile districts of the Company's territory would be in touch with the railway, and the check the line would place on Masai raids would probably considerably extend the area of cultivation, and enable much valuable and well watered land now unfrequented to be made use of by the agricultural Wakamba."

In a later paragraph of the report, it is stated:—

"As regards the action of the Masai with respect to the construction of the proposed railway, I do not think that they would offer any opposition to it. Cases of thieving would occur, no doubt, but of organised or even petty opposition there would probably be none."

In the debates which took place in the House of Commons in regard to the construction of the railway, the opposition to the railway was almost entirely based on objections drawn from the character of the Bagandas and Masai, with whom it was feared trouble might ensue. The Masai were at that time estimated to number 100,000 and it was considered that the best effect of the railway would be to put a stop to their raiding and oblige them to adopt peaceful industry.

Position of the Karol in 1908.

The following extract from Mr. McDermott's book referred to above, indicates the position in which the Karol were to be found after the cattle-raids and massacres which decimated the tribe and their lands in 1907 and 1908. This extract was written in 1908 and also shows the early attitude of the Karol towards the Company's administration.

"The Karol, who inhabit the country west of Kikuyu and who have was such notoriety for marauding, have latterly fallen upon evil days and have ceased to be the terror they formerly were to the other tribes. The presence of European authority in the country bordered them with new foes from the East, and no party, however small, has been molested passing through their country, or obliged to pay the 'hongo' tribute, since the advent of the Company. The moral authority of European occupation has been of itself sufficient to secure this respect. The steps taken to discourage their raiding routes have restricted their forays in other directions. Lastly, the epidemic which lately swept over the country and destroyed the cattle was a terrible blow to them, and reduced them to the verge of starvation. The Wa-Kikuyu, their old enemies, have seized every opportunity of attacking their kraals, and by force or fraud have made a practice of carrying off their women and children as slaves. Some of these they have retained for themselves, some they have bartered with coast traders and some with the neighbouring Wakamba. The slave trade thus carried on Kikuyu has been the subject of the persistent efforts of Mr. Dawnsett and Mr. Hall to suppress. Their efforts has met with marked success, especially in stopping the raids between Kikuyu and Ukambani. It would be impossible at present, and until the Wa-Kikuyu are more completely under control, to prevent the raiding and kidnapping of these people in the Karol country, but the liberation of their captives, when discovered, has lessened the profits of the business and so has discouraged it. For has this been the only measure taken with effect by Mr. Hall. Last year a party of the Karol came to live at Fort Smith and begged protection for their people. These were in the forest, in hourly danger of an attack from the Wa-Kikuyu, and Mr. Hall sent to have them brought in. Mr. Hall's men actually found the Wa-Kikuyu assembled on the place ready for the attack, the usual method of which was to kill all the men and carry away the women and children. By a couple of shots dispersed them, and the Karol party, numbering between 400 and 500 souls, were brought in to the Company's station. These people, Mr. Hall stated, belonged to the Mbaramkuru section of the tribe, and owing to a feud existing among the various sections of the Karol and the treacherous attacks of the Wa-Kikuyu, they had suffered heavily, and wished to live under the European 'Bwana'. Accordingly, Mr. Hall settled them on some ground near the fort where they could cultivate, and although they were entirely destitute, and it was evident that help from the Company's stores would be needed for some time, these people quite understood that they were to live for their own labour, and gratefully settled down to work. The Wa-Kikuyu in the neighbourhood received them in a friendly way and supplied them with plenty of food." As Mr. Hall observes, had it not been for the protection thus promptly given them, "these people would now be scattered through the forests as slaves to the Wa-Kikuyu, and the men all killed and the fate of their herding cows have under protection has had a distinctly depressing effect on the driving propensities of the Wa-Kikuyu."

Karol in Ngong

These Karol resided for some two years near Fort Smith and were then removed to Ngong, where a temporary station was built.

Protectorate Uganda

In June, 1894, a Protectorate was established over Uganda, and that Protectorate was defined as extending over the whole of the intervening territory from which the Imperial British East Africa Company had withdrawn its effective control. The whole of the country to the east of the eastern limits of the Company's district of Kikuyu was then originally included in the Uganda Protectorate, and, in fact, so remained until the 1st of April, 1902. The result of this division was that part of the Karol tribe was to be found on the eastern borders of the Uganda Protectorate, while the Company retained control of the Karol situated east of that line, round the Ngong Hills and on the plains to the south-east.

On the 1st of July, 1895, the remainder of the British sphere between the Zanzibar and Uganda boundaries and the Tana River and German frontier was placed under Her Majesty's protection, and the area, together with those Protectorates which had previously been established on the part of the East Coast, was fused into one administrative whole under the title of the "East Africa Protectorate." The western boundary of the Protectorate in the Masai country was the Kedong River, and while Lekipia was in the East Africa Protectorate, Serengi, Njemps, Naivasha, Elmenteita and Naivasha were situated in Uganda. East Africa Protectorate

In November, 1895, a large caravan consisting of some 1,400 Swahilis and Kikuyu was cut up by the Masai in the Kedong Valley on its return from Eldoma Ravine, to which place it had been sent on Government duty. Nearly all the Swahilis lost their lives but a fair number of the Kikuyu escaped and reported the incident to Mr. Gibbons, the officer in charge of Fort Smith. Mr. Ainsworth, the Sub-Commissioner, left Machakos for Fort Smith and he, together with Mr. (now Sir Frederick) Jackson, who hurried down from Naivasha, conducted an enquiry into the matter, at which it was established that the Swahilis were the aggressors, the brethren having taken two girls from a Masai kraal. These had been headed back on a result of representations made by the Masai, but a renewed attempt to capture them had been made the following morning before the caravan started on its journey. This attempt was unsuccessful but a shot was fired in the village which killed a cow, and the Masai attacked the caravan as a retaliatory measure. Kedong massacre

Mr. Andrew Dick, an English trader who was travelling in the neighbourhood in company with two Frenchmen at the time of the massacre, attacked the Masai and succeeded in capturing them from a number of cattle, but he was killed by the Masai in his attempt up the Kikuyu Escarpment. Mr. Andrew Dick

As a result of the enquiry into these two incidents it was held that the Masai had been acting under such provocation that no great punishment was necessary. They had lost a considerable number of men in their encounter with Mr. Dick, and the only punishment that it was considered necessary to inflict was the confiscation of the cattle that had been captured from them by Mr. Dick, which cattle were paid to the relatives of the Kikuyu who had lost their lives in the massacre as compensation for the loss sustained.

One important result followed the "Kedong Massacre." Lenana, the Masai Laibon, who had for some time expressed his intention of visiting the Government officer at Fort Smith, had overcome the reluctance shown by his followers, and had actually arrived at that station just before the news of the massacre reached Mr. Gibbons. There he was instructed to stay until an enquiry had been held, but when the result of the enquiry was known he was so impressed with the impartial hearing given to the Masai witnesses, and with the justice of the decision, that he vowed allegiance to the British Government, a vow which he faithfully kept. British justice on this occasion gained the friendship of the most powerful man in the Masai tribe, and rendered his influence mostly loyal to the administration from that day to the day of his death. Lenana's first visit

The Masai in the East Africa Protectorate were situated on the frontiers of Uganda, of which they occupied the southern portion, and inhabited the district known as the Kenia or Kikuyu District. The following extract is taken from Sir Arthur Hardinge's "Report on the Condition and Progress of the East Africa Protectorate from its Establishment to the 30th of July, 1897," and once again describes the tribal position of the Masai at that time:— The Masai Hardinge's report

"The Masai consist of one entire tribe, the Naivasha or Kisongo Masai, whose King or Chief is Lenana, and of the broken remnants of seven other tribes, the Dagoretti, Sudu, Laguenti, Matapato, Kaputiei, Olkiruki and Kwafi Masai, who, after long terrorising the whole country here at last were defeated and broken up by the superior force of the Wakamba and Wa-Kikuyu, and, having had their old military organisation utterly shattered, have accepted, and to a great

[illegible] cannot are really controlled by the authority of the European district officers. It may seem strange that this race of brave and haughty warriors should have succumbed to tribal or inferior to them in military prowess as the Wakamba and Wa-Kikuyu, but the reason is to be found in the peculiar conditions of their mode of life.

"Once their very flocks and herds were decimated by the great cattle plague of a few years ago, the Masai, a purely pastoral people, were compelled by Nature to depend, not partially as before, but exclusively, upon milk, and about half, or perhaps more, of the warriors of a given tribe would be absent for a long period on a foray, leaving the kraal, which with them, owing to the diffuse of the whole race for any material labour, is never stockaded or provided with defensive works of any kind, protected by a few hundred men.

"The Wakamba, and, after the Masai were driven from Uganda proper into Kikuyu, the Wa-Kikuyu, would be on the watch for these raiding expeditions and, as soon as one was well on the way, would swoop down on the undefended or only partially defended kraal in overwhelming numbers, and the raiders would return with their spoil only to find their homes in ashes, and the women and children whom they left behind them carried off to be sold as slaves.

"A constant repetition of these tactics, which their necessary dispersion, after the foray, upon milk, prevented them from meeting, broke the power and prestige of the Masai, and those in the settled and administered portions of our Protectorate at least, with the single exception of Lenana's tribe, are now a mere feeble fragment of this once indomitable people.

"They are mostly settled at Ngong Ngong, a hill seven miles south of the district headquarters of Kikuyu, where they live under the supervision of an English officer.

"Lenana's tribe now have their headquarters at Naivasha, on the Uganda side of the border, Kisumgu, their summer quarters, being also under the Uganda administration, and though Lenana himself is said to wish to settle in the East Africa rather than in the Uganda Protectorate (though my old man he and his people have been in the habit of wandering from one to the other), it would probably be most convenient that he should not be encouraged to do so.

"Besides Lenana's, a section of the Naivasha Masai have followed his brother and rival for the Chalbaindip Sembeyo, to the district known as Loita, on the German frontier, and pasture their cattle sometimes on one, sometimes, but always, on the German side of the border. Sembeyo is said to be more hostile to Europeans than Lenana, and his attitude has of late given grounds for thinking that both we and the Germans might have trouble with him. There are also Masai tribes of whom, as yet, we know little or nothing, living at Ukiro, near the base of Mount Kenia.

"A Sabei tribe, or rather caste, formed out of various conquered and enslaved neighbouring tribes of Bantu race, constitutes the servile class among the Masai, and performs the necessary domestic and menial labour which the latter deem degrading. This race or caste is known as the Wakwenda. Their proportion to the Masai in the Province of Uganda is said to be about 14 to 100. They are generally paid in kind for their labour, and are free to hold themselves for sale and hire, but must give half their gain to the chief [illegible] of the Masai. They are forbidden to marry Masai women, and their brands are separate from those of their Masai masters. This is the only approach within the Province to any regular system of domestic slavery. Among the other tribes, each slave or serf and generally members of a neighbouring but tribe, made prisoners in a raid.

"These raids are, however, fast diminishing, on the authority of our African officers in making land left, and Mr. Hemsworth reports to me that, whereas in the years 1906 to 1908 and a month passed without serious incident in connection with driving and slave-trading, he has only had to deal in the last twelve months with a few isolated cases, not more than three having occurred in the last quarter.

"The political and military organisation of the Bassi has been so fully described by the various travellers, notably Mr. Thomson, who have made it their study, that it is unnecessary for me in this report to reproduce the information which without his greater knowledge that I was permitted to possess, have already appeared on this subject. There seems, so far, but little hope that the wild people will, as a whole, be weaned from their predatory mode of life, and induced to become peaceful cultivators; though a few of them settled at Sponge Bogue have recently begun to take to agriculture, under the supervision of the local officials.

"The total number of the Bassi in the Kwale district, including the Mandrillos, is estimated by Mr. Ainsworth at 20,000. There is one settlement at Sponge Bogue include 400 "Bassoos" or warriors under 20, commanders or "Lapsoos," and about 4,000 old men, women and children."

In another part of this report Mr. Arthur Hastings writes as follows:—

"Mr. Gibbons, who is in charge of Kikoyo, introduced the practice of employing Bassi runners to carry the mails, and they have proved, I believe, very satisfactory, covering the 100 miles of the first stage in five days. The average total time taken to transport the mails from Mombasa to the Kikoyo Ferries, a distance of 400 miles, is twenty days, or about 20½ miles a day. The weight of each load of mails is 20 lbs."

In a subsequent passage, dealing with the slave-trade, Mr. Arthur Hastings writes:—

"The trade in Ubombo is confined to the district of Kisa, and is chiefly in Bassi women and children.

"Its origin is as follows:—When the Bassi of Sponge Bogue, near Kwale, were decimated about four years ago by an epidemic of small-pox, following upon a severe cattle plague, which obliged their warriors to go long distances to sell for cattle, and thus have their trade almost undisturbed, the Kikoyo people, their hereditary foes, fell upon them in overwhelming numbers, massacring their old men and carrying off their women and children as slaves. These they are now selling at low rates, having more of them than they want, to local Arab or Swahili middlemen, who, driven by our settlement from from the coast, can only carry on their trade with safety in inland districts as yet unoccupied by us, and who resell the slaves thus purchased at a profit to the settlers throughout remote Ubombo, these latter people being all Government free, and therefore requiring to be supplied with such slaves as they may need from other tribes.

"Some of the Bassi girls are kept by their Swahili purchasers as concubines, and these, when they have learnt in a year or two enough Swahili to pass in the Swahili from as coast women, will go there with their masters to the coast, where a few of them (not having borne children) may be secretly sold to other Arabs or Swahilis, but Mr. Commissioner Ainsworth, who knows Ubombo well, assures me that they usually all remain in Kisa, and further whether fifty of them in a year could have it."

Referring again to the activities of Swahili, Mr. Arthur Hastings wrote:—

"[illegible] which have made it necessary to keep a capital watch on them. Ambiwa, Chief of the Lake division of the sea, who speaks sometimes in English and sometimes in German fashion, has been endeavouring to persuade his brother Lamaa, the Chief of the Bassi of Ndimaiyo, all of them on one side of the border, to join him in a general movement against the Germans in Kilimanjaro, who recently shortened a local tribe of Bassi, the Wa-Arabia, for the murder of two German missionaries.

"In anticipation of trouble in this quarter, I sent reinforcements to Taveta, and the simultaneous arrival of troops from Uganda at Fulwaha and at Sponge Bogue from Kwale seems to have induced Lamaa to decline Ambiwa's proposals, which, though primarily directed against the Germans, really aimed at a general rising against all European control."

[illegible]

P.L.12 [illegible] Sir Charles Eliot [illegible]

In his report on the East Africa Protectorate, dated the 10th of June, 1905, Sir Charles Eliot describes the Masai as "perhaps the most remarkable people in East Africa. . . . . The greater number are still needless nomads, who roam about over the hill Valley and the plains between Kilima Njaro and Baringo. . . . . .

"The spread of law and order has somewhat curtailed their exploits, but they are still all reaction by profession. . . . . .

"The Masai are found in both German and British territory. When the last Chief, Sempele, died, a dispute arose between his sons, Lenana and Sendeyo, as to the succession, and the tribe was divided. The former is now recognized as Chief of the Masai in the British sphere, and the latter of those in the German. Sendeyo has several times had trouble with the German authorities, but has always been defeated. Fortunately for us, Lenana's loyalty spirit advised him that he had better make peace with the white men, because they were invincible, and he has proved our best friend and ally among the natives. In return, he receives £6 10s. 0d. a month, which is a very moderate stipend for a monarch of such considerable power, both real and imaginary. Though I see no reason to anticipate that Lenana will change his present attitude, I regard the Masai as the most important and dangerous of the tribes with whom we have to deal in East Africa, and I think it will long be necessary to maintain an adequate military force in the districts which they inhabit."

At the date, the Masai in the East Africa Protectorate had been placed in a district of their own, called the Masailand District, whose headquarters were at Nairobi.

Inclusion of Uganda Protectorate in East Africa Protectorate.

By an Order of the Secretary of State for Foreign Affairs, dated the 4th of March, 1906, the Kisumu and Kericho Provinces of the Uganda Protectorate were included in the East Africa Protectorate, and the Kericho Masai therefore came under the control of the latter Protectorate.

Uganda Railway.

The construction of the Uganda Railway was commenced in 1896, and the line reached the Lake in 1901. Throughout the construction period the Masai gave no trouble whatever to the workers on the line.

Sir Charles Eliot's Report, 1906.

In his report on the East Africa Protectorate, dated the 16th of April, 1906, Sir Charles Eliot writes:—

"I agree with those who do not think the Masai are a formidable element in East Africa. It could, of course, be certain to achieve them, and there is always some danger of misunderstandings in dealing with a people of whose language we are profoundly ignorant. But it appears to me that, even within the last year, the Masai have become more amenable. They have taken to trading and Shamba, and the astonishing collections of cattle, which were common a few years ago, are now comparatively rare. Lenana even wears a greatcoat and is one of the judges at the Nairobi cattle show."

Later in his report he writes:— "The troops, which are under the direct management of the Military Department of this Protectorate, have the full functions of the King's African Rifles. The company at Fort Hall is composed of Masai. There is no doubt of the martial spirit of this tribe and they are certainly fine military material, but I have my doubts as to their qualification for service in a disciplined army. General Hunter's last report on their capabilities is favourable, and he only criticises as there is that they cannot stand service in the rank. There are many advantages in employing the Masai as soldiers and police, for they are little disposed to colonize, and if we are effectively to stop their general occupation of cattle raiding, we must give them something else to do. In some ways they seem very dull. They are very orderly people, and have better notions of honour and loyalty than most tribes, but it would greatly be safe to trust too much to Masai troops and Masai police in Masailand."

The following quotations are made from the Protectorate Annual Report for the year 1908-09:— GAR* 175

"About the beginning of September last, it was reported that the Maori contemplated a wholesale raid into the Kiel country; the adoption of prompt measures, however, both in this province "(Charlottenberg)" and at Malmaka, prevented any carrying out of their intentions. Since that time they have been quiet, with the exception of a party belonging to the Mungaria section, which recently organized a small expedition some two or three months ago; the head concerned was fined, and the "Ngamen," or head warrior, is now a fugitive, the raid having been unsuccessful. With the exception of these two incidents, the conduct of this tribe has been satisfactory. . . . . ."

"Nothing of great political importance has occurred in this district" (Karwabe District, Rumbekwi) "during the year. In the autumn of 1908, the Maori held a large circumcision festival on the plains of Kinyapp (or Kinyapp). This was attended by several thousand Africans, and it was thought by some that the event would be commemorated by the dispatch of a large party to raid Lambwa, Kiel, and, possibly, the German territory on the back of Shiraki. Though the idea was discussed by them on the spot, it was considered advisable to make a military demonstration in the neighbourhood of Karwabe to discourage any breaches of the peace. At any rate, the ceremonies on Kinyapp passed over without incident. Curiously enough, about this time, a large war party of Maori did raid a raid on the country east of Shiraki, but, owing to warnings sent by us in anticipation of such an event, little damage was done, and the raiders were dispersed by the German troops. The German neighbours appeared to be under the impression that Sender organized this raid, but what "elderes," or warriors, formed the war party seem to remain in obscurity. The elders of what may be termed the Karwabe Maori are undoubtedly loyal, and will do their best to discourage raids by the elderes. [541]

"The executive officials in this district who may be considered to be in the confidence of the tribe, report that the elders discuss the question of raiding quite freely, and often enquire what is to become of the poorer elderes, who have no livestock, and thus cannot marry and settle down as "Elderes," or Elders, and are willing to hybridize, do not see how they are to acquire wealth. Numbers of these men a been livelihood by herding the property of their richer friends, others serve in the King's African Rifles and police force, and those in regular government employ, steadily save enough to start them in married life. It is probable that a partial solution of this problem lies in the formation of a labour bureau, the object of which will be to find suitable employment for the poorer elderes and "Ibibi," or youths, who have not attained the status of warrior." GAR* 175 MR 46A

As distinct from the Maori Horde, the history of which forms the subject of Chapter III., the early history of the Maori contains little further of interest. The administrative steps which have been taken on their account from time to time have been treated separately in the following chapters, and Maori raids may be said to have ceased after the year 1908, the last year in which they carried out a successful expedition against another tribe in the Protectorate. Their more recent raids against German territory, are referred to in Chapter VII. GAR* 175

Wa-Kwafi

174 Arusha-wa-jôo. Others, driven south, threw in their lot
16 with the Wa-reguha, keeping tribally more or less distinct
[797] from them. These are the hybrid tribes visited lately by the energetic missionaries, Messrs. Last and Baxter, and of which such interesting accounts have been given in the "Proceedings of the Royal Geographical Society." Another section of the Wa-kwafi was driven westward, and now forms the colonies of Ndarserria-ai and Ngurume-ai. The establishment of these colonies has been an unmitigated blessing to the country. In every case they have become the centres of trade, where men's lives and goods are safe; and indeed there is no more striking feature in the results of the enforced change in the people's mode of life than the remarkable development of peaceable habits and honest ways. This shows what the Masai, from their distinctly higher mental development, are capable of, when cut away from their traditions and brought under conditions more favourable to their advancement towards civilisation. As throwing light on the origin of minor races and the blending of two distinct types as at Taveta, the subject is an interesting study.

The Wa-kwafi were not all scattered thus, however, for a large division of the clan kept together, and contrived to cut their way through Kikuyu and to reach Lykipia, where they settled.

• 175 Another section crossed the meridional trough and reached
726 the opposite half of the plateau in Guas' Ngishu. In both
628 districts they found superb grazing-grounds and plenty of elbow-room, and there for a time they remained quietly, and increased rapidly in numbers. At last their wave began again. Grown bold, they attacked the Masai about fifteen years ago. The opposing parties formed regular camps, and fought pitched battles with great fury, thousands being killed on both sides. The women stood by and watched, while they incited and urged on the combatants in their terrible hand-to-hand encounters. The Masai were at first beaten, but, fighting with the stubbornness of despair, they disputed every foot of ground. They were driven from the whole of Naivasha and Kinangop, and their enemies, still victorious, carried the war into Kaptè. Matters now changed, however. The Masai of the entire region to the south gathered together and came to the assistance of their brethren of Kaptè. Soon the tables were turned, and the Wa-kwafi were gradually forced back. The great majority of them

6:Thomson K-3 (1883-1884)1887
FL12 Masai FL12

were killed, and the cattle driven off. Famine came upon them, and they were reduced to the terrible necessity of selling their children. Large numbers took refuge at Njemps and Njiro, where they had to bow themselves to the cultivation of the soil. The war lasted several years. At last only a remnant of the Wa-kwafi of Lykipia were left, and these contrived to make peace. Not so fortunate were those of Gnar' Ngishu. The Masai swept from north to south, and left not a man in the entire land, those who escaped the spear and sword finding refuge in Kavirondo.

Such is the history of the bloody feud between the Masai clans. Now they live peacefully together, with kraals in friendly proximity.

Having thus conveyed to the reader some general notions about the tribe as a whole, we may now conveniently turn to follow with the eye of our imagination the life-history of one of its members.

Very many years ago a matron of the Masai lay in what is pleasingly described as an "interesting condition." Her environment was not of a luxurious or even comfortable nature. She lay on no better a bed than a dressed bullock's hide spread on the bare ground. The hut which protected her from the blazing sun or the cold night was not built on sanitary principles, and was not commodious. It reached a maximum height of three feet and a half, and might be nine feet long by five feet broad. It was constructed of boughs bent over and interwoven together, forming a flat-roofed building with rounded corners. To keep out the wind a composition of cow's dung was liberally plastered over the boughs. This sufficed for the dry season, but for the rainy one a further covering of hides had to be laid upon it. The doorway was of the smallest, and stood at right angles to the line of the house in the manner of a porch. The hut of the expectant Masai lady was one of a circle enclosing a considerable area, in which the cattle were kept during the night. As this central space was never swept up, its condition may be better imagined than described. The smells were strikingly suggestive of the farmyard; and if the reader is so inclined, he may imagine some charming pictures of full-uddered kine, with their mild eyes and expressions of repose as they contentedly chew the cud. For any such picture, however, I can accept no responsibility. Outside the circle of huts there extends a strong fence of thorns as a protection from wild beasts, and in case of an attack. Inside

SECTION VII

THE MASAI EXTRA PROVINCIAL DISTRICT

GENERAL NOTE

Masailand constitutes an Extra Provincial District under an Officer in Charge, holding the powers of a Provincial Commissioner, with two District Commissioners, stationed at Kajiado and Narok. The legislation in force in other parts of the Colony applies to the District, but the Outlying District Ordinance, No. 25 of 1911, has also been applied to it, in order to provide a means for controlling immigration from other tribes, a matter to which, as will be subsequently shown, much importance is attached by Masai tribesmen. The area of the District is 13,777 square miles and the population was estimated in 1948 at 55,000.[1] The density is thus 3.9 per square mile. [34] [34]

The Masai District contains in its more northern section a considerable area of land which ranks for agricultural or pastoral purposes with parts of the neighbouring Highlands reserved for Europeans use, though it is to be noted that the rainfall here is more variable than in the central part of the Highlands. The lower parts of the District have a lower and even more variable rainfall, with the result that there is an area, conservatively estimated at a little over 5,000 square miles, which is arid and for all practical purposes waterless.[2] But the value of the large area held by the Masai is not to be judged by its agricultural possibilities, for if the Masai no longer justify the character assigned to them by history as "a virile tribe of predatory nomads," they have at all events maintained their traditional habit of life as a pastoral people, and though there is some cultivation in the Naivasha-Ngare area and also near Ngong, this forms only an infinitesimal part of the District, and is for the most part carried out by Kikuyu immigrants on behalf of the local Masai. 50 132

It is of interest to note that in 1904 the number of cattle was estimated at only 50,000 and the sheep and goats at 60,000. This may have been an underestimate, though it must be realized that the country was still to some extent suffering from the effects of the great rinderpest epidemic of 1891, which had resulted such catastrophic results both on the numbers and the military power of the Masai. By 1914 the estimate had gone up to 600,000 head of cattle and over a million and half sheep and goats.[3] The Masai herds suffered severely in the droughts of 1917 and 1918, when their losses of cattle were estimated at over a quarter of a million. But a recent estimate has put the number of cattle at over 300,000, with 600,000 sheep and a large number of donkeys. The further increase in the number of cattle is to some extent affected by the existence of fly, which is prevalent on the South Kavirondo boundary, in the extreme west, and also in the middle area, where the Kajiado and Narok Districts join. But if the present estimate of the stock is correct, 311 543 333 145 [131] 471 333

7: Hailey G-4 (No date) 1950 FL12 Masai FL12

was further complicated by the fact that at stated intervals, normally about 15 years, power passed from the hands of the representatives of one Age-Group in each Section into those of the succeeding Age Group, there being thus an alternation of authority in each Section between the Right Hand and Left Hand Groups.

To quote Sir Charles Eliot again, the consequence of the traditional structure of Masai society was that "the centre of political gravity was not with the elders or chiefs, but with a republic of young men, governed by ideas of military comradeship. The chiefs arranged the details of any raids which the young men wished to undertake, but their power of compelling them to do anything which they did not wish was very slight." The nearest approach to a central and superior authority was to be found in the Chief Medicine-Man (Laibon), though his authority was based mainly on the discharge of his magical functions.[1] The medicine-men were divided into three grades, of which the first grade was represented by the person of the Laibon, the Chief Medicine-Man of the tribe, and his guidance was held to be of the first importance in any raiding operation which the tribe might undertake.

THE INTRODUCTION OF THE NATIVE AUTHORITY SYSTEM

It is unnecessary to dwell here on the circumstances which for a prolonged period made the Masai a matchless menace to the peace of their neighbours. The tribe seems to have reached the height of its power between 1800 and 1850, when it overran Kenya and part of Tanganyika.[2] There were subsequently severe internal dissensions among the Masai, which resulted in two of their five "divisions" being practically destroyed and there was also great mortality as a result of the outbreak of rinderpest and smallpox in the 'eighties of last century. But even though their strength was much reduced, their predatory habits continued to be a matter of grave concern in the early days of the Colony, and seemed in particular to threaten the progress of European settlement. Among the Masai themselves strong feelings were aroused by the measures, taken largely in the interest of European settlers, designed to counteract the propensity of the tribesmen to roam widely in search of fresh grazing grounds, as the result of which they were restricted to a Northern Reserve (Laikipia) and a Southern Reserve, separated from the Northern Reserve by a broad belt of country occupied by European farms. This was the position at the time of the Masai Agreement of 1904, but it subsequently became the policy of the Kenya Government to move the tribesmen in the Northern Reserve into the Southern Reserve, which was to be largely augmented to serve for this purpose.[3]

In view of the terms of the Agreement of 1904, the assent of the Masai was required for this transfer, and the operation was not of obvious difficulty. In the circumstances it was not unnatural that the Government should have avoided until of the influence exercised by the Chief Medicine-Man, the Laibon Lenana. He had inherited from his father, Mbatian, who died in 1911, a position which commanded general respect, and he himself took a leading position on behalf of the tribe in the discussions which led up to the Agreement of 1904, which he signed as "Chief Laibon." He was subsequently recognized

---

[1] The word laibon appears to be a Europeanized form of the Masai word Olaibon (sh. 0. Hollis, The Masai, 1905, page 40).

[3] The Laikipia Reserve comprised 2,000 square miles. An addition of 6,000 square miles was to be made to the Southern Reserve.

Ti Hailey G-4 (No date) 1950 FL12 Masai FL12

by the Government as the Paramount Chief of the Masai, a title which was in 1911 confirmed to his son Sogi. It was as Paramount Chief that Sogi, through his Regent Lenjulin, signed the Agreement of 1911, which recorded the acceptance by the Masai of the move from Laikipia to the Southern Reserve.

But Lenana himself never seems to have claimed a position of sovereignty, nor was it ever accorded to him by the tribe. Sogi proved to be lacking in the qualities of his father, and such influence as he possessed was confined to the small Section of which he was a member, while the more important Sections, such as the Purko, either refused to recognize him or treated him with contempt. In 1918, therefore, the Government withdrew his recognition as Paramount Chief. Apart, however, from any question of the personal capacity of Sogi, it is obvious that the social structure of the Masai had no place for the conception of chieftaincy in the form existing in the traditional organization of those Bantu tribes which have a "centralized" system of Government. In the latter, the fundamental principle is the recognition of a tribal head, with authority devolved on territorial subchiefs, and supported on the allegiance of headmen representing either kinship groups or village units. In such an organization the authority possessed by the headmen is so essential an element as that of the Chief and his subchiefs—a fact which is sometimes overlooked by those whose contact with a tribe is primarily through those more conspicuous figures. All these features of the normal Bantu tribal organization were missing in the structure of Masai society.

Following the abolition of the post of Paramount Chief in 1918, the Government endeavoured to find agencies for local administration in the promotion of three institutions, a Central Masai Council, a series of 19 Native Councils each representing a different tribal Section, and Headmen, created as far as possible on the model of the Location Headmen found elsewhere in the Colony. The Central Masai Council at Ngong was composed of the presidents of the Native Councils and was to meet twice a year. The 19 Native Councils were designed to take the place of the informal Councils of Elders to which reference has previously been made. They were recognized as tribunals exercising powers under the Native Tribunal Rules of 1913, and were moreover given the position occupied by Collective Headmen under the Native Authority Ordinance then in force (No. 10 of 1912). The members of these Councils consisted of the recognized Counsellors (Laiyonoki) of the different Age Grades in the divisions, with a few of the more influential Elders and Morans added. Morans (Laiyonoki were not ordinarily admitted to these Councils of Elders, but as the Elders did not themselves possess any great measure of control over the Morans, it was thought that the appointment of their leading warriors might help to improve the situation. These appointments could, however, only be temporary, owing to the custom already mentioned, under which an Age Grade of Morans held its position only for a specified period in each Section, giving place to a new Age Grade at the end of that time. The presidents of these Councils were chosen from the Laiyonoki by the Masai themselves.

The greatest difficulty was, as foreseen at the time, occasioned in regard to the appointment of Headmen. These were not necessarily Elders, but were chosen as possessing wealth or influence, and were given the position accorded to headmen by the Native Authority Ordinance of 1912. But there were two obstacles to their effective discharge of these powers. The units which they were selected to control were not Locations with a settled population, as in most other parts of Kenya, but groups of semi-nomadic villagers, and their

7: Hailey G-4 (No date) 1950 FL12 Masai FL12

authority always tended to break down in face of the lawless and independent spirit of the Moran. In 1918 the Headmen numbered 46, of whom 28 were unpaid, and 18 received pay ranging from £6 to £36 a year, the former Paramount having a special pay of £90. Fourteen of the 18 paid Headmen were presidents of the Native Councils, and following the custom adopted in many other parts of Kenya, they were given the courtesy title of Chief.

SUBSEQUENT CHANGES IN THE SYSTEM

In the period that has passed since this system was introduced, there have been changes which have to some measure affected the structure of Masai society. The emphasis exercised on cattle raiding has robbed the military organisation of its former importance, while the growing value of cattle and sheep has enhanced the position of the wealthier stockholders, who now constitute, together with some men of hereditary prestige, an aristocratic element with an acknowledged leadership in Masai society. In other respects the Masai hold tenaciously to their customary institutions and mode of life, and the Moran in particular retain the traditions of indiscipline (in all but a military sense) and the aversion to labour which characterized them in the past.

The Government has in the interval effected changes also in the system of native administration above referred to, with the view of adjusting it more nearly to the pattern followed in other parts of Kenya. The Central Masai Council and the 14 Native Councils gave place in 1950 to two Local Native Councils, at Narok and Kajiado, which have now been formally constituted under the provisions of the Native Authority Ordinance of 1937. The system of subsidies has also been revised, as will be further explained below.[1] The Headmen have been divided into two grades, Headmen and subheadmen, of whom the former have the courtesy title of Chief. They now derive their powers from the Native Authority Ordinance of 1937.

The 16 Headmen have a pay ranging from 17s. to 70s. a month, and the 18 subheadmen a pay ranging from 10s. to 30s. 30 cents a month. Practically all the Headmen or subheadmen are stockholders, and represent the ruling Age-Grade in each of the different Sections; very few of them are educated or literate and only a few can speak Swahili. The Headmen and subheadmen constitute the executive agency of the District administration and of the Local Native Councils, and they are in addition charged with the collection of the native Poll Tax. That is a task which they are said to discharge with some efficiency, though as will be shown subsequently in dealing with the administration of the Tribunals, there are numerous cases of the evasion of tax. The Chiefs can call on the services of a small number of Tribal Police, recruited and controlled by the District Commissioner. Up to 1943 the Tribal Police were the only force of this nature in the Province, but since that year a unit of the Kenya Police Force has been stationed in the Narok district, largely in view of the prevalence of stock thefts.

THE LOCAL NATIVE COUNCILS

Of the two Local Native Councils, that at Narok has 12 nominated and 13 elected members, and that at Kajiado 12 nominated and 14 elected. There is, however, little difference in practice between the nominated and elected members, since all are in fact selected by the District Commissioner after

[1] Page 173.

7: Hailey C-4 (No date) 1950 FL12 Masai FL12

Mbugwe are Bantu. There is also a small group of Tindiga, leading virtually a bushman life in the Lake Eyasi basin, to whom reference was made in Section 1.[1] There would appear to have been a movement both northward and southward on the part of the tribes, who were previously contained in a very small area by the Masai invasion of the early part of the century.

THE MASAI DISTRICT

The Masai District forms the southern portion of the large block of country in Tanganyika and Kenya, extending to no less than 115 million acres in extent, occupied by the Masai tribe, whose numbers were given in the 1931 Census as 48,193 in Kenya and as 41,178 in the 1948 Census in Tanganyika. There will be found in the Chapter dealing with Kenya Colony further reference to the tribal characteristics of the Masai, and it will be sufficient to give here only those facts which bear in particular on the position they occupy in Tanganyika.[2]

The southern movement of this tribe from the neighbourhood of Lake Rudolf seems to have come to an end about the middle of last century, but its spearheads had in 1850 penetrated as far south as the Great Ruaha River and even to Ulehe in the Iringa District, whence they were driven back by the Gogo and Hehe. There were many isolated Masai raids after that time, but these were in the main carried out by Kenya Masai, whose incursions were directed towards the coastal areas on the east, and indeed took them on occasion as far as Mombasa. The Masai settled in Tanganyika do not seem to have attempted a further movement of any importance into the neighbouring areas of the Territory.

The Anglo-German Agreement of 1890 cut the Masai country into two parts, roughly equal in area, though the population remaining under the British jurisdiction was somewhat larger than that which fell under German rule. The result was to make an effective division between the Kenya and Tanganyika Masai, and though the two sections have retained a community of racial sentiment, this has not extended to the political field. Such political unity as the Masai people possessed had existed largely for war purposes, and in peace time political as apart from religious authority was dispersed among the headmen exercising control over the groups having a customary right of pasturage in particular localities. There was moreover lacking in the case of the Tanganyika Masai a motive which might have led them to identify themselves with the Kenya Masai, namely, the need for protecting their lands from alienation by Government for the benefit of Europeans. The troubles caused in Kenya by the efforts of Europeans to secure possession of Masai lands[3] were not repeated in Tanganyika, where the Masai have remained unmoved in the occupation of the country they held at the period when European rule was established.

The present Masai District comprises, in the north, the Loldaiki area, the dominant feature of which is the vast Serengeti plain, with the extinct volcanoes which mark its southern end. In the centre, south of the Rift Wall, the plateau type of country is characterized by volcanic hill masses, which provide a number of permanent water sources. In the South lie extensive dusty scrub steppes, with a low and very variable rainfall.

Practically the whole of the area included in the District is used only for pastoral purposes. If tradition is correct in holding that the tribe was once

---

7: Hailey G-4 (No date) 1950 FL12 Masai FL12

grades, which has resulted in marking off the whole of the younger men, roughly up to the age of twenty-seven or thirty, as a warrior class (morans) who are not only free from more obligations to work, but are independent in many other aspects of tribal discipline. Though therefore authority has varied nominally with the Elders (laigwanak) who have passed the stage of morans, and with the Councils of Elders who formed a regular feature of the Masai tribal usage, these Councils have not in the past nor are they to-day able to enforce decisions which may affect the younger men. It is true that the Elders have recently made decisions, accepted by the morans themselves, which will limit the period of moran-hood and may provide the morans with work on betterment schemes, but it still remains to be seen how far these will be effective in providing a solution for a problem of which the economic is no less serious than the social aspect.

Attempts were at one time made in Tanganyika, as also in Kenya, to utilize the Laibon, the spiritual head of the Tanganyika Masai, as Native Authority. But the Masai themselves objected to his occupying this position, and as the result of a Sociological Survey made by H. A. Fadiman in 1948, the system was altered. The gazetted Native Authority then became the Masai Council, which in practice consisted of Headmen and Elders, and apparently also of any tribesmen outside the moran age grade who cared to attend. But this Council was in effect only a consultative body, without any practical authority, and since the Headmen were not gazetted as Native Authorities, they had no legal power to issue Orders under Section 8 of the Native Authority Ordinance.

A further reorganization has now been carried out. Each area now has its own Local Council, with locally elected representatives of age grades and clans, and these Councils have been gazetted as Subordinate Native Authorities. Representatives from each Local Council, differing in numbers in accordance with the size and population of the area involved, compose the Masai Council, which is the Superior Native Authority for the whole Masai District, excluding Sonjo. The Council is now limited to these representatives: there is, however, provision for the addition of morans or uninitiated members if and when advisable. The Local Councils have begun to exercise their Order making powers under Section 8 of the Native Authority Ordinance. There are 27 paid Headmen, chosen by members of their own age grade.

There is a Masai Native Treasury, which however is managed entirely by the District Commissioner. The small Sonjo tribe has a Council of Sonjo Headmen, which is gazetted as a Native Authority, and has a separate Treasury.

THE WORKING OF THE NATIVE AUTHORITY SYSTEM

The variety of conditions is so great that it is difficult to generalize on the operation of the system of native administration in the Province as a whole. There are, however, certain points of special significance. The recent reorganization in the Chagga Native Authority area has placed in a superior position those Chiefs who already had a high status in view of the number of taxpayers in their jurisdiction, but its future success will depend on the manner in which these Chiefs can secure the co-operation of the more progressive elements who have now been brought within the framework of the system, as members of the new Divisional Councils. This is especially necessary, in view of the character of Chagga society, for though the Chagga are probably the

9:Fosbrooke G-6 (1936-1948) 1948 FL12 Masai FL12
Kisonko

and Lumbwa were indistinguishable, merely two sub-tribes of a pastoral tribe, indulging in civil war; cf. Krapf—"the two kindred tribes the Wakwafi and the Masai hate each other mortally, which is, however, a fortunate circumstance for the weaker African tribes"; Thomson also regards the Masai and Kwavi as two sections of the same pastoral tribe, and records in detail the ascendancy of the former. As he was writing fifty years ago, when all phases of the civil war were well within living memory, his account may certainly be accepted as correct. Elliot's suggestion that the Lumbwa are offshoots from an agricultural Masai tribe is also discounted by legends recorded since he wrote, notably that of the exodus.

The first part of this section, dealing with events occurring prior to those within living memory, may well be closed with a review of the state of affairs circa 1900, a survey of the tribes dispossessed by the Masai, and an examination of any evidence throwing light on the era prior to Masai invasion. Sabei, who died about 1900, was settled at Laikipia, below the present District Office at Maralal, with Sankuraka as his main water. He was surrounded by members of the Ingishong clan at Mum, Sugum at Mukogi and Ogenja Lelem. The Arabs were established on the slopes of Mount Mera, and the Masai effectively occupied an area corresponding closely to their present boundaries. They had suffered a severe famine about 1890, but owing to the warlike efforts of the Ant Dwat ago the country was by the time fully restocked. The Kyangan, a few of whom are alive today (1948), were carrying on border wars with the Ngan, Gogo and Mbala tribes, and it is doubtful whether Kavirs, Tulamai or Kiaro were as yet in Masai hands. On the other hand, they at this time possessed areas now lost to them, as for example the country between the east bank of the Ngro and the Pare Hills, extending as far south as Swiba, the almared and cultured area around Kilimanjaro, Moro and Mandal; and the country between the Naivasha-Kikuyu road and the Kendu Hills, now lost to "Ny".

To the west of, and also immediately below the Rift Wall, the country was probably inhabited by at least three tribes, the I Dorea ki Gokiaba (Mbulu ?), the I Dorea ki Kuroo (Mbugwe ?) and the Sonjo. It seems likely that at any rate some of these tribes practised agriculture under irrigation, but that they possessed cattle also is almost certain. The Mangyore area, as shown above, was in possession of the Arbore, a pastoral tribe, while the Mandal, Wiwamber, Engare Parpuki and Umanjiro areas were occupied by the Ilgishale, again pastoralists, said to have been akin to the Masai.

Further south, Masai tradition of previous habitation, except by the various tribes of Dorobo, is lacking, owing to the fact that the Lumbwa and not the Masai entered the previous occupants, if any. It is possible that the Ngas and Sarungi tribes extended slightly further to the north than they do at present, but existing climatic conditions indicate that, at most, these people have lost no more than a few border waters to the Masai.

junior age are concerned, beginning to regard themselves as a unit. Ngorongoro is another area where arbour conditions pertain.

C. **Recent History: Famine — civil war — German Policy.**

Again taking up the thread of history, the period 1880 to 1890 is regarded by the Masai as one of prosperity. Mbatian was the laibon at this time; it was he who rallied up the Moita Masai to fight the Uasingishu and Laikipiak sub-tribes. But the period was mainly occupied with wars and raids against neighbouring tribes: the devastating effects of such raids, as noted by early explorers, are graphically illustrated by extracts from their writings reproduced in the "Administration History".

But about 1890 the Masai were visited by the triple calamities, of famine, smallpox and rinderpest. Whole families, together with their stock, were wiped out. In some cases the survivors lived by hunting or agriculture; in others they were adopted into, or carried off into captivity by, neighbouring tribes. The tribe was in fact scattered from Lake Victoria to the Coast. But such was the urge to the nomadic pastoral life that, in the course of the next few years, most of the wanderers returned, and from their savings or stockings commenced to build up new herds.

During the famine Mbatian died, and the tribe was divided by civil war. For two of Mbatian's sons, Lenana and Sendeyo, were rivals for the position of laibon. The former had a following of Purko and other sections, the latter was backed up by the Loita. After various skirmishes round Narobi, Sendeyo turned south, and his Loita beat in turn the Laitayok, Sale and Serengeti of the Loitokitok area, thus finishing up at Ngorongoro. From there they descended to Kisongo, some of the Loita spreading to Longido and Ginning. At one time Sendeyo himself lived at Lemagrut, but later returned to Ngorongoro. When below the Rift he had numerous skirmishes with the Germans, and also with the Kisongo, supported by the Purko. His final defeat was brought about by a clever flanking movement; the Kisongo, by this time recovering from the effects of the famine, approached Lenana, who agreed to send his Purko from the north, via Loitokitok, while the Kisongo attacked from the east. Thus both parties would converge on Sendeyo at Ngorongoro. When Sendeyo heard of this, he saw that the struggle was hopeless and fled by night to Lenana to admit defeat. Lenana allowed him to return as laibon to the Loita section.

An important feature of recent history is the policy which the German Government pursued in relation to the Masai. When they first made contact with the tribe, the Masai of Tanganyika, being scattered by the famine, must have been very few in number. The area south of the Moshi—Arusha—Mbugwe road was therefore thought sufficient as a Masai Reserve, and the objective was to keep Moshi, Longido, Ngorongoro and Loitokitok areas free for alienation. This meant that the Laitayok and Ntanangoro Loita of Loitokitok, the Sale and Serengeti west of the Rift, the Kimwaki of north West and Moshi, the Siginari of Serea and the Sampetu of Longido, were all debarred from their grazing grounds. During the war, when the policy was relaxed, the various sections began to

G48

[illegible] and others, each to its own area. But the Moita section seems to have flourished above all others and penetrated, during and after the war, into areas which had never before been in its possession.

The details of this period of famine, civil war and European intervention have not been recorded at length, but it is hoped that sufficient has been said to drive home the point that the period 1890 to 1900 was one of great upheaval for the Tanganyika Masai. The most obvious effect of this was the break-up and subjugation of many of the sections, together with the loss of the loyalties which held these sections together and generally of political cohesion. Only time can bring about a reorientation in accordance with the present distribution of population.

Another aspect of the above historical review should also be borne in mind. It is almost impossible to find at the present day an elder who did not go through considerable hardship in his youth. To anyone who has lost and regained a possession, such possession is of greater value, at least sentimentally. The Masai of Tanganyika lost their cattle, their mode of living and their tribal life, and largely by their own efforts have once again regained them. It is suggested that their intense conservatism and resistance of change may perhaps be better understood in the light of the foregoing.

191

For clarity this historical section is concluded with a chronological chart showing the main events and personalities referred to.

a small legacy of a few cattle to anyone he likes, but the bulk of his property must be inherited according to the above rules.

Women's Property.—As a general rule a woman cannot own cattle herself, but hold them in trust for her husband. I have twice come across exceptions to this :—

(a) A woman who had pled the profession of a doctor (i.e. native herbalist) and had received cattle in payment.

(b) A woman who had amassed wealth outside and independently of the tribe.

Household utensils such as gourds, hides, and donkey saddles belong to the women of the house.

Laibons (Masai, 'L-Oibonak).—Hollis, pp. 324-326, gives the history of the *Laibons* up to the beginning of the present century. I will therefore briefly summarise their more recent history.

Lenana was made paramount chief of the Masai in Kenya Colony by the Government. He died in 1911. Some people thought that his brother Sendeyo had bewitched him, but little evidence need be attached to this opinion. He appointed his small son Seggi to succeed him. As Seggi was a minor, Ngeruya, son of Sulian, first cousin to Lenana, was appointed as regent. Between the years 1912 and 1922 it was the Kenya Government's policy to curtail the powers of the *Laibons*. Seggi grew up a weak and lovable person, who has little authority, and is more often drunk than sober. At one time he was deposed from paramount chieftainship for persistent inebriety, but was subsequently re-appointed to be paramount chief of the Kajiado District only.

His brother, Kimeyeni, is *Laibon* of the Purko section. He is a weak character, but straightforward and honestly. He is very untrustworthy owing to his desire to seem more important than his character warrants him to be.

Ngeruya is now a very old man. He is *Laibon* of the Kaimayoki section. Sendeyo is *Laibon* of the Loita section. He was deported to Shira in 1922, it having been alleged that he was implicated in the rising of the Il Kiteng age-group of the Purko at the end of 1921. He was allowed to return to Loita in 1928 and still lives there, much loved and respected.

Whereas in Kenya the power of the *Laibons* has been much reduced since Lenana's death, and councils of elders have been created to try and take their place in the government of the tribe, in Tanganyika Territory the authority of the *Laibon* has been upheld and he is regarded as the paramount chief. I believe that the system has worked well. Until recently their *Laibon* was Parit, a son of Lenana. Parit is now dead, and a minor, whose name escapes me, has succeeded him.

In Pl. XXII, Fig. 1, is seen a photograph of Seggi holding in his hand the lemon club of his grandfather, Mbatian, and the iron club of his father, Lenana (see Hollis, pp. 325 and 326). Mbatian's lemon club is at present in my possession, but should be returned to one of his descendants at some future date.

12. [illegible] GROUP

THE BUGAI

HISTORY

The first Europeans to become acquainted with the Bugai were the adventurous [illegible] and Ashanten at long ago in [illegible] and a short account of the [illegible] the Bugai was given by Krall in the introduction to his Vocabulary of the Dagwali dialect.[1] In [illegible] the Cambo-[illegible] Factor managed to reach Bamako, but had to return owing to the hostility of the Bugai, and it was not till [illegible] that a Company, Joseph Thomson, consented for the first time to journeying East Africa from the east to Lake Victoria through the land of Bugailand. At the time of Thomson's visit, [illegible] (Indians or [illegible]) were making [illegible] the Bugai [illegible], and the Bugai was [illegible] slightly alarmed by an [illegible] of [illegible]. After Thomson came the Bugaiman Count Teleki who also passed through Bugailand without conflict, and found the [illegible] still [illegible]. The [illegible] in 1887. In 1888 the Imperial British East Africa Company, having established a station at Machakos in 1886, decided to establish a station on the Bugai-Kikuyu frontier. "Dagaga Bugaiu," a well-known [illegible] situated on the east of the Kikuyu hills, was the site chosen, but Captain Lugard, who was given the task of building it, [illegible] Dagaiu, a few miles above Kikuyu, as being more suitable. At this period Bugailand was not in fact, by its position between British and Company, the Company holding [illegible] in Uganda territory, and the rest of the Bugai to the East Africa Protectorate. The Bugai themselves were also split by the East Africa [illegible] (Lenana) and the Northern Section, which was not settled till 1902, the [illegible] having acknowledged British rule after [illegible] the Government had no actual trouble from the Bugai, and there was no expedition against them the Bugai [illegible] against the Dorobi, in which Bugai tribes actually took part on behalf of the Government. In 1906 the Bugai Reserve was formed, [illegible] of Lubaiya south of the Uganda Railway, which was extended to the south of Bugailand in 1908, the other half of the railway between Bugai Station in the north and the Anglo-German frontier in the south. In 1911 an agreement was made with the Bugai to move the inhabitants of the Northern Reserve into the Southern Reserve, which, to accommodate them, was extended on the east as far as the River Ebadidim, a tributary of the Tana, and on the west to the River Mara, subsequent extensions added a few square miles of each side. The move began in June, 1911, but came to a stop owing to the congestion of people and cattle in the Mara regions, and many of the Bugai returned. A year later the move was begun again, and at all events the [illegible] was completed by March, 1914. In Colonial Bugailand [illegible] the Bugai were confined to an area bounded on the north and east by the Kikuyu-Bugaiu road, thus allowing the Bugai of the East Africa Protectorate (Kikuyu) to penetrate to Lubaiya. Early attempts at missionary work among the Bugai were not successful, enough among the [illegible]. In 1910 Sandford stated that "there are no [illegible] Bugai Missions in the Reserve, though attempts have been made by various Missionary bodies to obtain from the Bugai permission to erect a station. These attempts have met with no encouragement from the Bugai, and nothing has been done."[2] A Government school was established about 20 years ago, and a branch of the African Inland Mission has been working in the Reserve for some years.

The 1948 census gives the following figures:

		Male	Female	Total
Kenya	Kenya	[illegible]	[illegible]	[illegible]
	Kikuyu	[illegible]	[illegible]	[illegible]
	Masai	[illegible]	[illegible]	[illegible]
	[illegible]	[illegible]	[illegible]	[illegible]
		[illegible]	[illegible]	[illegible]

* Estimated.

		Male	Female	Total
Tanganyika Territory	Arusha	[illegible]	[illegible]	[illegible]
	Moshi	[illegible]	[illegible]	[illegible]
	Mbulu	[illegible]	[illegible]	[illegible]
	Kondoa	[illegible]	[illegible]	[illegible]
	Pare	[illegible]	[illegible]	[illegible]
		[illegible]	[illegible]	[illegible]
Total for Mandated		[illegible]	[illegible]	[illegible]

This shows only a small increase over the 1931 estimate for the Kenya Masai, which 10,000 Samburu are deducted; but it doubles the previous estimate for the Samburu and shows a substantial increase in the Tanganyika Masai.

The livestock estimate for the Kenya Masai are:

	Cattle	Goats and Sheep	Donkeys
1948	[illegible]	[illegible]	[illegible]
1949	[illegible] to [illegible]	[illegible]	[illegible]

The figure for cattle among the Tanganyika Masai are [illegible] but these may be underestimated. They vary in fact from about 400,000 to 700,000 according to season and other factors.[1]

The total area of Mandated in Kenya and Tanganyika is about 41,000 square miles or 26,000,000 acres (11,000 square miles or 6,600,000 acres in Kenya, and 30,000 square miles or 19,000,000 acres in Tanganyika). After deducting 5,000 square miles or 3,000,000 acres from the Kenya Land Unit as being neither on account of bush or tsetse fly, the Kenya Masai have about three acres per head of stock which is stocked with sheep that graze, whereas in country such as Mbulu cattle alone require anything from four to ten acres per head, owing to the low rainfall, poor grazing, scarcity of rivers, and lengthy droughts. Their Land Unit is also a Game Reserve.

Sources: Sandford, [illegible] (L.A. Comm, 1948).

PHYSICAL ENVIRONMENT

At the height of their power in the middle of the 19th century the Masai occupied a stretch of country which covered some 600 miles from north to south, and of the order, 150 miles from east to west. The northern limit was approximately Lake Baringo (now much fish), 20 miles south of Lake Rudolf, the southern, Longido, near

[1] H. H. Dyer Grant, "Kenya to Abyssinia" (1948), p. 10.
[2] Information from the U. S. Embassy.

13:Huntingford E.-4 (no date) 1953 FL12 Hawai FL12

Kisii, some 50 miles south of Kisumu in Tanganyika. The most northerly Masai were (and still are) the Samburu, who in 1900 extended more than 100 miles north, north towards Lake Rudolf. This vast country, with an area amounting to some 80,000 square miles, now reduced to one-half its original size, has great variation of altitude, climate, rainfall, and vegetation. There are three vegetation zones: the lower or southern has desert scrub and a desert type of grass; the second or medium zone has thorn bush and medium grass; the third or highland zone has evergreen forest, parkland, and tall grass. In Kenya, the altitude of Masailand ranges from 1,000 to 8,000 ft., through to the highlands which in between Mount Kenya and Elgon in zone 2 the hill in some places rises to 10,000 ft. Most of the present Masai Land Unit is in zone 2; part of the extreme southern territory of pre-Congress times is in zone 1. In Tanganyika, the Masai territory is at a lower altitude, ranging from 1,000 to 6,000 ft. and including the isolated mountains Kilimanjaro and Meru. Much of the country is arbitrile, and belongs to zone 2. In Tanganyika Masailand, there is one permanent river, the Ruvu or Pangani, on the eastern boundary; there are a few seasonal rivers, but for daily main water supply the Masai depend on wells, waterholes, and springs. Since only the dried year is well covered, and most of the Masai live in zone 2, their life is conditioned to a great extent by the water supply, and in the semi-arid a form of transhumance is practised. In the present Masai Land Unit in Kenya, the rivers are few, and the rainfall low. Most of the few large rivers run their together to both country useful for grazing, the main rivers, too, rise in the Masai and quite few flow halfway across the Land Unit in one season, the Ewaso Ngiro. There are no lakes except the salt lakes Magadi, Natron, and Simbiri, though in the northern part formerly occupied by the Masai in the Rift or lake Baringo, Hannington (salt), Solai, Nakuru (salt), Elmenteita, and Naivasha. The Rift Valley, in which these lakes lie, runs right through Masailand from south to north. In many places the floor of the valley is a wide grassy plain as others, as in the Kedia Valley, it is narrow with high precipitous walls. The rainfall is low, the average for the eight years 1910-17 and 1926-8 at Ewaso being 19 ins., with a range of 37 ins. to 12 ins. It is recorded that at Longido in one year there fell only 9 ins., those of from to one night. With such a rainfall, grazing cannot be anything but scanty. The average rainfall recorded by three gauges in the Masai region between Kilimanjaro and Arusha for nine years is 20.8 ins. There are two seasons, the dry weather from June to November, followed by short rains in November and December, after which there may be rain in January and February (January: 1910, 0.00 in.; 1911, 0.20 in.; 1917, 0.00 in.; February: 1910, 1.00 in.; 1911, 0.00 in.; 1917, 0.20 in.; though in 1910—a dry year in Kenya—there was only 0.20 in. in February). The dry weather is called "the months of hunger" by the Masai. The rainfall not usual in from March to May, "the months of plenty," though small amounts of rain may fall in other months, notably June to August, which are called "the months of disease." The figures given for Kenya refer only to Masai, and to the more arid parts there is not only less rainfall, but the small precipitation out of season has little effect on grazing or water supply. Except in the highland zone, where there is some seasonal variation, the temperature varies only between 60° and 80° F.

Sources: Thomson, 1885; Swaillard, 1906; Page-Jones, 1908; James, 1908.

BASIC FEATURES OF ECONOMY

Seasonal Grazing

In dry weather the cattle graze round the permanent waters; in the wet season the cattle are driven to the temporary waters that form, leaving the grass round the permanent waters to rest. In both seasons the kraals are built a few miles from the water supply. On one day the cattle are taken to drink, and on the next day they

THE DISTRICT SUB-DIVISIONS

[illegible] where mutual conditions appeal to the Masai. Honey, honey-wine, and honey are got from the Dorobo. Only men used to the gill skin for trading with the Dorobo [illegible] [illegible] for cloth, beads, wire, and so forth. Trade [illegible] Masailand is conducted mostly by the women, for by mutual arrangement they were allowed to pass unhindered from tribe to tribe even during the progress of a war.

Hunters

[illegible] Though the Masai do not have [illegible], and despise those who do, they used occasionally to kill wild animals (elephants for their tusks, buffalo and eland for the meat and hides, antelope for their feathers, and lion and leopard to protect their cattle.

Labour

[illegible] Although deprived of their cattle and occupation, fighting, the Masai have not yet as a people accepted any substitute for it. Being, as Goldfield noted, "too proud to work," i.e., for wages. A small number have accepted employment as herdsmen on farms, and some have done good service in the Police and K.A.R., though even in a military capacity most of them are still unwilling to submit to a form of discipline that is not their own. Though a few have taken to cultivation, the majority have not yet consented to stoop to what they consider labour unworthy of a Masai.

THE AGRICULTURAL MASAI

[illegible] The agricultural Masai, the I-Loangwa (Loaiboni) and I-Ilkiaw of former days, are people of Masai stock who, having lost their cattle through disease or defeat, were forced to take up agriculture in order to survive, and by so doing accept the lowly contempt of the pastoral Masai. It is in most case uncertain how long the various groups of I-Ilkiaw have been agriculturalists; some of the southern Masai, for example, were defeated by the Lega early in the 19th century and took to agriculture. Earlier in 1882 reported groups of "Widiawi,"[1] as he called them, living on the southern edge of the Mau at Nduenduai (Ndoro arikay), 10 miles south-east of Naivasha, in the region known as Ngorongoro (in Kenya), "the Gorge,"[2] for about 40 miles north of Lake Natron, at the southern foot of Mt. Meru and at Kilio.[3] Van Orlmel adds Nduenduai, 20 miles north-east of Lake Natron.[4] Another group is named by Thomson and von Orlmel[5] at Tavetu, while the map in Hollis's The Masai shows them as extending for about 100 miles south-south-east of Lake Naivasha. The two known, however, are the northern group called I-Tumaa or Ka-Ipmaa (Ngongo near Lake Natron), concerning whom we have (such as it is) the fullest information.

[illegible] With the exception of the Tavetu group, the agricultural Masai in general resemble the pastoral Masai in appearance, dress, and general culture, and though they cultivate the ground, still have the acquisition of cattle as their chief ambition. Those of Tavetu have mingled with the Tavetu,[6] and have become the most successful cultivators among the Masai; the rest of the agricultural Masai in the days of Thomson and Hollis grew mainly sheaves and millet, while the I-Tumaa grew also pumpkins, and chief concentrated to grow maize. Most of the agricultural Masai supplemented their diet by hunting, bee-keeping, and, where possible, by fishing.

13.Huntingford E.-4 (no date) 1953 FL.12 Maasai FL.12
Agricultural Plots

In 1952 the D'Ilemete numbered about 2,000 (1,400 according to the 1948 Census) and though they are of Maasai stock, being descended from a Maasai section called D'Ilemete, they have absorbed a variety of refugees including Kamasia, and become settled herders. According to one Ildiani they had originally two villages of the south end of Lake Baringo, but two were destroyed on account of Maasai and Suk raids, and some of the inhabitants, having lost all their cattle, took refuge on Kibiria Island in Lake Baringo. They are expert swimmers and possess canoes. Though one Ildiani was seen in 1951. Their dwellings are round huts with rather high pitched and somewhat convex thatched roofs, and walls of posts and sticks. There are recorded into two permanent villages known as "Ilyangle Kulima," and "Ilyangle Ruiyo" in the Tigirish valley a few miles south of Lake Baringo; the closely packed huts almost touch each other, and the wood-walled grounds are surrounded by strong palisades.

In general the D'Ilemete keep as close as they can to the dress and customs of the pastoral Maasai; they have circumcision and dances and other ceremonies, and practise the "ime-lore" system of the pastoralists, though without the monyatan. Today they have some 100,000 acres of poor land, most of it unfit for cultivation, but they have acquired, since the establishment of British rule, some 12,000 or more head of cattle, and 30,000 goats and sheep, thus achieving in part the ambition of all D'Ilemete to become cattle people again. In the time of Thomson and Teleki, however, Ilyangle was an important station on the caravan route, and one Ildiani stated that they had a large extent of cultivated land. This was divided into blocks (the size of three to four miles square) which were transacted by irrigation channels bringing water from dams across the river Tigirish. This system was still working in Chandler's time, who says that the opening of the main ditch was performed with the sacrifice of a sheep at the mouth of the ditch.[1] Besides agriculture, the D'Ilemete hunted and trapped; eating the lion, and spears of bull and Cordons type.

It is possible that the Ildiani group called D'Ildiani who live on the east shore of Lake Rudolf is to be classed as D'Ilemete.[2] They speak an a dialect of Iten shore which, when Teleki and von Höhnel saw them in 1888, had produced an D'Ilemete, but it seems now to have resulted in considerable physical degeneration, and in the appearance of albinos in all members of the group. There seems to be a good deal of Lokiria blood in them.

The D'Ilemete round Mount Nyiro are a large tribe of agricultural Maasai, originally of Samburu stock, but now accepted by the pastoral Maasai as worthy of recognition as a group which can pay and receive cattle for compensation in cases of homicide. The Ilangayo in Southern Guaseland are also to be classed as agricultural Maasai.[3]

SOCIAL ORGANIZATION AND POLITICAL STRUCTURE

Series Organization

Life Cycle

From birth to circumcision a male is a boy, *el-oyoni*. At circumcision[4] he enters an age-set and becomes a warrior, *el-morani*, "one who is circumcised," and may associate with uncircumcised girls. At the *el-ajoton* ceremony he becomes an elder, *el-moruo*. Warriors may marry when they become senior warriors. After the *el-ajoton* the newly made elders attend to their family concerns, and get wives

[3] The people known as Kisiiers in northern Tanganyika are not Maasai, but people of Samburu stock who have adopted them.
[4] There is some uncertainty as to the age at which boys are circumcised. Hollis gives the limits as 12-15 years; Kipkorkor gives the lower limit as 18 or 19.

/14 cont./

dare to appear unannounced before the mighty one. Thus, the Maasai living on the military station of Maschi /Moshi/ remained hidden during Zendeo's presence when the latter visited it at the beginning of 1906, and my Maasai servant did not dare deliver a message either to Zendeo or to an assistant sitting beside him.

The aim of the chief's policy is the unity and strengthening of the Maasai. By letting the capacity of the warriors spend itself in expeditions against foreign tribes, he protects his own people from devastating civil wars for which the endless friction of the districts among themselves would give continuous occasion. This influence makes possible for him the belief that a victory is attainable only through the secret power of the war medicine that he alone knows how to manufacture, and a defeat must inevitably come if he pendiere it. Neither he nor his closest relatives go to war. He gives remedies against epidemics and sicknesses -- as a rule in the form /18/ of magic medicines -- and orders supplication feasts in honor of the Maasai god Ngai ai. He reads the prophecies from an oracle game of the kind of the counting off of buttons. From a goat's horn provided with a leather cover (Fig. 1) he takes a handful of river pebbles, puts one or several of them aside, and throws back the rest. After he has repeated this several times, he announces his prophetic verdict, which often enough is worded in Pythian ambiguity. The game, like the lineage, is called ol gidoi. The office of ol oibonai is hereditary and has been handed down until the most recent times from father to the eldest son of the principal wife. The badge of his office is an iron club.

Fig. 1.

The Maasai do not know much to say about the genealogical tree of the Ol oibonik. The first four or five names that it contains belong to chiefs who ruled in early times. These names are: Kidoiet, Gesiga, Bergumbe (Ramjumbe), and Lesigirifuchi. The next chiefs are historical and descend from modern times. The first of them, Kiheleta, seems to have ruled at the beginning of the nineteenth century; he was followed by his son Sitonik, who

791 /19 cont./
• 175 was followed by Subet and the latter by Mbatyan. After the latter's
[619] death the Masai split up. One part placed itself under Lenana,
the eldest son of the principal wife, who was born before the accession of Mbatyan, the other under Zendeo, who was the old man's favorite son and named by him to be his successor. The people relate that Lenana cheated Zendeo out of the succession in a way similar to how Jacob cheated Esau out of the right of the first-born. Whereas the deception was achieved in the latter case through the tied-on goatskin, it was made possible in the former case by the gloom of the hut in which old, weak Mbatyan was lying on his sick-bed. He thought he had Zendeo before him and instructed Lenana in the secret arts of the ol olboni. The two are now bitter enemies,
[669] who maintain a continuous civil war, to the misfortune of the Masai people. Lenana, now a man about 40 years old, lives with his followers in British East Africa, in the vicinity of the railroad station Nairobi, whereas Zendeo, ten years younger, inhabits, with his hordes, the steppes of German East Africa. Both are merely phantom figures in comparison with their father, who had occupied an
175 outstanding place in the succession of chiefs. Under him the Masai
619 experienced their last golden age. After his forefathers Sinoik and
791 Subet had subjugated the Wakuafi, it rested upon him to keep down
726 their constant uprisings and to weaken and enslave them so that no
[669] danger from them could threaten the Masai any longer. Through a well-organized spy system Mbatyan kept himself continuously informed about the conditions of his opponents, so that the rapacious warriors could always attack those very Wakuafi settlements in which a war expedition /20/ against the Masai was being prepared. The most trouble here was made by the Wakuafi of Meruberg /Mt. Meru/, who found safe hiding places for women and livestock in the clefted mountain forests, while the men undertook raids on
175 neighboring Masai kraals. Finally, however, the Meru people were
619 successfully mastered: indeed, they even became so pliable that
791 they performed compulsory labor for their oppressors. One must
727 bear in mind with what deep contempt all men of the Masai people
466 look upon any kind of work, which they regard as something dis-
461 graceful, not compatible with a man's dignity, in order to

/20 cont./
understand what such a success meant. Mbatyan demanded thousands of workers, and they moved obediently, in endless long lines, men, women and children, toward the steppe area of Kilenjo, lying

Meinhof photo.

Ill. 4. *Zendeu*, the present chief of the Mbaui.

west of the mountain, where the mighty one resided, like his successors. There they had to dig a long water channel, whereby -- a further particular humiliation -- the men had to work in rank and file with the women. Encouraged by these and other successes, the Mbaui became more and more arrogant, and they extended their war expeditions farther and farther. It was not only the Negro tribes of the interior who had to suffer under their lust for robbery and murder, they even penetrated into the immediate hinterland of the coast and directly approached the coastal cities of Mombasa, Tanga, Bagamoyo, and others.

The belief in the magic means for healing purposes which Mbatyan gave those seeking help, and whose chief ingredient quantitatively was the vanilla-scented, pulverized wood of the of mogoigora liana, was so deep-seated in the people /21/ that it was often supposed to have actually brought to the people

/17 cont./

recovery from their pains. Mbatyan earned outstanding merit through the discovery of a preventive vaccination against lung disease of cattle. According to the corresponding accounts of Zondwa and few old blood, Mbatyan, several years before his death, had already prophesied the appearance of Europeans than did not take place until after it and the subsequent subduing of the blood by Europeans. In the outward appearance of this man nothing divulged his power. On a thin, average-sized figure sat an ugly head whose face was disfigured more particularly by the lack of one eye -- allegedly a birth defect. This latter circumstance led to the origin of the legend that the chief must always be one-eyed and that the father should destroy in childhood one eye of the son later following him. The face was even more repulsive because of a scanty, slightly gray full beard. That is, in contrast to the other men, neither the *ol ollomi* nor the *ol gojonik* and *ol ilkaidi* mentioned further below may pluck out their beards, because they would lose their supernatural power through the removal of the beard hairs.

The chief's village consists of a large number of kraals lying close together, several of which serve as the dwelling of the *ol ollomi* with his numerous wives. Mbatyan had about 100 wives; the still young Zondwa has only 10 of them. No strange man may enter these dwelling kraals of the chief and his wives or appear in their immediate vicinity. Close by are found the rest of the kraals, one of which is intended for conferences and receptions and in which a few elder men close to the chief as helpers and advisers (*ol dalgonik* [illegible] *ol ollomi*) live with their families, whereas the others are occupied by warriors who form the defense of the village and, as the *manion* of the chief, his bodyguard. In his last years of life, when Mbatyan was mentally disturbed, he often spent months on the open steppe in a small hut made of branches, around which the warriors accompanying him camped in a large circle. The ceremony in the chief's camp is very simple. One of the men wandering about idly in the village leads the newcomer into the conference kraal, where he waits for the chief. As soon as the latter appears, the stranger

[96] Before — the Masai tribe accepted what to see Western Mentalitself by conquering and enforcing the previous
[97] traditions (Sheet, 1967). The Masai were a fierce and warlike people. Once they had taken over that country no one seriously disputed it with them.

[98] In the early 1880's through the Government of Kenya the Masai made a treaty directly with the Queen of England. This involved re-settling a segment of the Kenya Masai, but the long term effect was to put the Kenya Masai in a privileged position relative to the other tribes — who did not have such a treaty — and to give them a degree of autonomy virtually unknown in other parts of Kenya. Because of their remote location and the nature of the Tanganyika administration, the Masai in the Tanganyika portion of Western Mentalitself also maintained
[99] a large degree of autonomy. Aided by these circumstances,
[100] the extremely conservative western Masai have kept largely to themselves, and to an extraordinary degree the modern world has gone on around them, instead of over them and through their country.

[101] My first visit to the Serengeti-Mara Region was
[102] in 1958. I had been assigned to carry out a brief ecological reconnaissance of the Serengeti National Park under the sponsorship of the Wildlife Management Institute and the American Committee for International Wild Life
[103] Protection (Talbot, 1954).

Reaching north from Arusha, the Great North Road skirts Mt. Meru, then crosses about 40 miles of fertile land just before passing Longido Hill, 10 miles north of the Kenya border. In German times (prior to 1918) the land from here westward into the Great Rift was colonized on a grand scale and Masai were excluded. From the descriptions of Dark African residents who studied the area during and just after the 1914-1918 war, and from the description and reputation map of Cowper (1918) this area was more populated *Thomson* green-lands, with good grass cover and abundant wildlife.

The British took over Tanganyika as a Trust Territory after World War I, and in the 1920's they opened the reserve to the Masai. For a time the Masai had moderate numbers of livestock, grazed seasonally in the area along with the wild ungulates. Then a series of water points were provided, using bore holes and piping water into the grassland from springs on nearby wooded mountains. This water allowed the Masai to keep their cattle year-long in areas formerly used only seasonally, with the result that most of the area has been devastated. The *Thomson* with the rest of the perennial grass cover is gone. The cattle is gone, leaving

[illegible] miles station north of Eastern Kenyland, and it is a desert at present. A tribal elder called Kwaleda found a way to climb the escarpment at the south of Kisaru and some of the tribe then moved into the Kenya Highlands. The legendary Kwaleda had also seen who became the founders of the present six Kwaal clans.

The tribe gradually moved south. At Ngong, near Kalondi, according to their traditions they found a Kwaraa-kaare child who became their first leibon or Kwaleda Kwa (Dhillo, 1905). Fukuzuka (1948) dated the arrival at Ngong at 1640 on the basis of the genealogy of the leibons founded by that legendary first child. During the next 150 years the Kwaal moved over [illegible] miles station southward.

[illegible] By 1800 a few Kwaal had made what proved to be the tribe's earliest penetration into Tanganyika but it was not until about 1880 that they had completed their occupation of what is now the Kwaal District in Tanganyika (Fig. 1).[1] There had been constant warfare and raiding involved in this settlement, and the peoples of Kwaaland fluctuated somewhat. For a time the Kwaal occupied the area immediately south of the Ngorongoro Highlands, as well as lands near Mt. Kilimanjaro and Mt. Meru that are now in other hands.

[1] [See p. 9a.--Analyst]

The people whom the Masai displaced in Tanganyika were mainly pastoralists. There were also some small tribes who practiced irrigated cultivation near the Rift wall and on some mountain flanks. These who immediately preceded the present Masai may have been related to them, and they, in turn, related other residents. Some of these early people dug wells and built dams, but Fosbrooke (1948) believes that except for irrigation systems on some mountains, these enterprises were for pastoralism rather than agriculture. There were also isolated tribes of metal workers in the south who may have provided the Masai with spears and knives.

In the study area, the Masai occupation of the Ngorongoro Highlands and the Serengeti Plain was probably completed by 1850. A people called the Il Datwa occupied the highlands and much of the rest of the area, both north and south of Ngorongoro. These were probably both pastoralists and cultivators. Another obscur tribe, the Sonjo, lived near the foot of the Rift near Lake Natron.

Somewhere between 1830 and 1851 the Masai drove the Il Datwa off of the Crater Highlands and the Serengeti Plain. The limestone walls of the eastern

[illegible] Serengeti are said by the Masai to have been dug by the Ill Dorobo, and they still call the Ngorongoro Highlands "Enkanga loit Dorobo" in memory of the people from whom they took the area. By the mid 19 years the Masai took the flat land immediately south of the highlands. Then, until about 1890, several sections and sub sections of the Masai occupied the entire Serengeti Plain, the Ngorongoro Highlands, and the lands immediately west of the Rift. They lost the land south of the highlands through desertion of the tsetse fly, just as they lost other lands to the east and south of the present Mainland.

During the period of 1800 to 1890 the Masai were a prosperous tribe and they probably reached their maximum land holdings and cattle numbers. The area they occupied extended roughly 500 miles from north to south and 250 miles from east to west, an estimated 65,000 square miles. Under the leadership of their paramount laibon, Mwalimu, they raided from Lake Victoria to the Indian Ocean. Barbour (1928) and Simon (1963) quote excerpts from the writings of many early explorers referring to the extent and effect of these Masai raids. The raids were not confined to other tribes, however. Some of their more devastating battles took place between different sections of the Masai themselves.

• 176 [illegible] About 1890, at the peak of their power and prosperity, the Masai were struck by famine, smallpox, and displacement. The effects of a protracted drought about 1890 was intensified by displacement. This infections also disease in often fatal to cattle and many wild ungulates. It was introduced into Ethiopia and Egypt from India and the Black Sea in the late 1880's (Rinderpest, 1988). By 1890 it had swept into South Africa, killing many of Africa's domestic and wild ungulates on the way. The disease entered Mozambique in 1891 via some diseased cattle stolen by the Masai at Lorenzo Marques (Rinderpest, op. cit.). At nearly the same time in any case entered Mozambique in the north and south west. It rapidly spread to virtually all the cattle of the Masai, as well as to many of the wild animals. At the same time a smallpox epidemic struck the Masai. Thomson (1894), who crossed the Ngorongoro Crater in 1891, wrote a graphic account of the pitiful condition of the sick and dying Masai he encountered on the Crater floor.

As a result of these multiple disasters, many areas formerly occupied by the tribe were emptied, the cattle gone, and the people dead or scattered.

175 During the famine, the Laibon Mbatian died. His

[illegible]

[illegible] but we saw the structure range of the Maoui. The organization of the warriors was much broken up. Many personal Maoui had lost their lands and had taken to hunting as individuals. Some had been taken to the surrounding tribes and others taken as captives by them. A great many had died as were killed in the subjugation of Tumbaru, Chakayanti, Waitiga, and other war. Therefore the population of Maoui in Mauriland around 1900 must have been quite low. The lowest ebb probably came around 1890 or 1895, and there had been some recovery in the next decade. Some Maoui had started to rebuild their lands by stealing cattle. Others bought them by working for the farmers helping to subdue other tribes.

It is uncertain what the fate of the Maoui would have been without the intervention of the Europeans. There were officials with Maoui-like belief that the Maoui were recovering rapidly and that they would have shown no greater power than the Europeans, who held them down and took their land. There on the other side say that the Maoui were a dying race and that only the protection of the Europeans enabled them to maintain their way of life. The truth doubtless lies between the extreme views. Even Pottie (1867) who was certainly not anti-Maoui felt that they would have to alter their way of life if they were to survive.

[illegible] In terms of total population the Masai have greatly prospered under European administration. It has been estimated that at the peak of Masai power, before 1890, the total population of Masai was around [illegible] (Simon, 1963). By the mid 1930's they had recovered from their losses of disease and their numbers were estimated at about [illegible] (Jackson, 1938). The census of 1948 gave the total Masai population as [illegible] (Statistics, 1948). The most recent census places the population at about 127,000.

[illegible] Most of the Masai prosperity in the 20th century has taken place under the English administration. In 1904 the foundation of the Masai Territory of Tanganyika stopped short of what is now Tanganyika Maasiland, but it was included in the Masai "sphere of interest" (Sharpe, 1905). Subsequently, apparently because there were no Masai living in Maasiland following their multiple disasters, the Germans created a Masai Reserve that was mostly north of an east-west line through Arusha. This division left the Ngorongoro Highlands, the Loliondo area, and the highlands near Kenya Maasiland free for European settlement and displaced the Masai living there. This action further increased the peripatis of the Masai, some of whom moved north into Kenya and others south into

the Kenyan Masai Reserve. After the 1910-18 war the English allowed the Masai to return to most of the areas they formerly occupied in Tanganyika.

After defeating the Germans, Germany returned to Kenya and in 1920 to peacefully acknowledged British rule. The Masai were still very few in numbers but they ranged over a wide area of Kenya, grazing their cattle and cultivating. In 1904 two Masai reserves were created, a northern one of some 4,500 square miles in the Laikipia area, northwest of Nairobi Maasiland, and a southern one of about 6,050 square miles which included part of the present Southern Maasiland in Kenya. The Masai, led by Lenana, signed a treaty accepting the reserves in August 1904. This arrangement did not prove satisfactory for either the Masai or the English. Lenana found it difficult to control the northern Masai when he was in the south and requested that the reserves be joined. Consequently, after several years of negotiations, a treaty was signed in 1911 in which the Masai gave up the 4,500 square miles of the Northern Reserve and received in return over 9,000 square miles of land including what is now the Kenya portion of Southern Maasiland. Part of this area was unoccupied, some of it was European ranch land, and part of it had been occupied in former times by Masai. This new half of the Southern

[illegible] Reserve became Narok District, with headquarters at Narok. The remainder of the Southern Reserve was Kajiado District, with the headquarters at Kajiado, about 40 miles south of Nairobi on the Great North Road (Fig. 1). The Provincial headquarters for both districts was located at Ngong, just west of Nairobi.

[illegible] With subsequent extensions, the Masai in Kenya received a total of over 25,000 square miles which included some of the finest grazing and farmed land in Kenya.

Partisans of the Masai say that the treaty of 1911 was a catastrophe for the Masai and that they were tricked by government into giving up good land for less. It is also pointed out, however, that as a result of the treaty of 1911 the Masai received more twice as much as they lost, and that land included some of the finest grazing and farmed land in Kenya. The treaty was negotiated and signed by the Masai leaders. As a result of that treaty, their population density in the reserve was probably about one and one third persons per square mile, as in terms of land, this treaty made the Masai one of the richest tribes in Africa.

[illegible] Regardless of the logic, the move was resented

strongly by many of the Beast constituents. One of these who made the move are still living, but the memory of it is kept alive by the Beast constituents. The Beast in Kenya's Western Mountland are, or are descended from, those who made the move from Lakipia. They are characteristically more conservative and more statecentric of the government than other groups of Beast, and they attribute these attributes to the move.

Rudewuda (1968:113), an advisor of the Beast, attributes the conservatism of the Tanganyika Beast to their handicap from Kenya, particularly GIAS and, and further identification to this map:

> It is almost impossible to find at the present day an elder who did not go through considerable hardship in his youth. To anyone who has been one regained a generation, such generation is of greater value, at least sentimentally. The Beast of Tanganyika have their cattle, their mode of living and their tribal life, and largely by their own efforts have also made regained them. It is suggested that their inherent conservatism and resistance of change may perhaps be better understood in the light of the foregoing.

During the Kenyan period the Beast were largely excluded from the Western Mountland in Tanganyika, although occasional rallying parties came through it. Between 1950 and 1965, according to Grant (1967), there was one Beast encampment on Ancient's Ranch

[illegible] on the Nara Kaplou on the western edge of the Serengeti Plain, just north of the headwaters of the Simiyu River (Fig. 12).[illegible] Western Maasiland in Tanganyika is large and was virtually unhabitated by Europeans, so statistics were found concerning the German period.

During the 1910-20 war the Germans [illegible] overthrew Tanganyika. The Masai when they had entered Ungua [illegible] to their former grazing grounds. In addition by the end of the 1910-20 war Masai from Kenya had penetrated the Serengeti region and the Ngorongoro Highlands. Part of these were from the Purko section, people who as a result of the 1911 treaty had moved from areas around Lake Naivasha to the Gotta Plateau north of Loliondo. Others were of the Gotta section who, formerly lived on the Gotta Plateau.

When the English took over Tanganyika as a trust territory after the 1914-18 war, they established all of Tanganyika Maasiland as a single Masai District. The headquarters were at Mondoli, about 18 miles west of Arusha (Fig. 12).[illegible] In the study area the western boundary of the Masai District is the line between the Lake Province and the Northern Province (which includes the Masai District). This line was drawn by the Germans

[illegible] [See p.1].--Analyst] [illegible] [See p. [illegible].--Analyst]

[illegible] ent in turn through the Serengeti Plain roughly paralleling the eastern border of the Serengeti National Park (Fig.6). Grant (1971) notes that the line is an arbitrary one which did not take account of the actual distribution of the Mawi. The Serengeti section of the Mawi formerly occupied the plains west of the line. When the Masai surrounded the area they apparently thought it relinquished because the Mawi had been displaced by fighting and disease. After the 1959-18 set the Serengeti Mawi returned to the western Serengeti. (They were then in Lake Province but they were so isolated from the administration that the District officer met the Mawi District at Loliondo handing their administration.

In 1958 the English administration ceded the Serengeti Kenya Mawi from Tanganyika to Kenya of the resident Kisaranga section of the Tanganyika Mawi. Since then the Kenya Mawi have been moving northward again slowly.

[illegible] Early in Kenya there the importance of the unique wildlife concentrations in the Serengeti and Ngorongoro Crater were recognized (Grzimek and Grzimek, 1960). During the period between the wars the Tanganyika Government created several nature reserves in the area protecting some of the wildlife from hunting, but not much affecting the Mawi.

[illegible]

[illegible] /illegible/

[illegible] [illegible] were when two centimeters high. /illegible/ through which the [illegible] [illegible], which are now supposed to be protected against becoming sick with tuberculosis, are permanently closed. Numerous observations in this direction showed me the justification of this view. [illegible] The [illegible] [illegible] is regarded as the invasion of the [illegible] [illegible].

In some years, and, to be sure, in the rainy season, great multitudes of dark green caterpillars are to see and a half inches long are found in the grasses of the steppe. Cattle that eat the caterpillars are stricken with [illegible] - the caterpillars. As symptoms of the sickness I observed: first a few hoarse coughing sounds, then giddiness, which rapidly occurs and makes the animal staggers as though out of drunkenness; soon it lies down and is brought to a standing position only with difficulty, only to lie down again after a few minutes, whereupon death occurs often after only half an hour. The necessary consist of bleedletting by an arrow shot (Fig. 70) into the jugular vein, whereby one to see and a half liters of blood is emptied out. Though that recovery is reached after just a few hours, as I observed in over 100 cases (1).

1. The microscopic examination of blood clots (ear, heart, spleen) of sick and dead animals gave a negative finding (Observer /staff physician/ Dr. Gerhardt). I observed the appearance of rumors of the caterpillars in March, 1905, in the steppe south of Kilimandjaro, in December, 1905, in the steppe south-west of Kilimandjaro, in the entire region between the latter and Lake Manyara, and in April, 1906, in Daressalam /Dar es Salaam/.

In another case, out of four head of cattle, after two had already died of the sickness, the other two, through the infusion of an emetic consisting of a mixture of sugar-cane beer and a tobacco extract, which was given upon the advice of the Wapare in Kwamata on the southern end of Lake Jipe, could be cured.

1: Hollis G-5 (ca. 1894-1904) 1905
FL12 Masai FL12

Some years ago this body conceived the idea of educating at their central station at Freretown, near Mombasa, a few of the most promising of their up-country converts. When sufficiently advanced, these boys or men are sent back to their homes and become teachers of the Gospel. Thus, one Ol-omeni[1], a member of the Oikop or Lumbwa Masai, who had spent some years under the able tuition of the Rev. A. R. Steggall at Taveta, was baptized under the name of Justin, and completed his education at the coast. He is now one of the principal supports of the Society in Southern Masailand. To the kindness of the Society in lending me Justin Ol-omeni's services, and to the diligence of Justin Ol-omeni himself, I am in a large measure indebted for the material contained in this book. Philologists will possibly be interested to hear that there exist Masai (and possibly members of other tribes whose language has ever been a closed book) who are able to correspond with one another in their mother tongue. I have in my possession, for instance, several letters written in Masai.

As a well-wisher of the Masai and one who has known them for a decade, I consider that every support should be given to the Church Missionary Society and to the other Missions engaged in proselytizing in their midst, for it is only by the gradual and peaceful civilization of the tribe that they can be saved from extinction. The encroachments of civilization are beginning to be felt in East Africa; and the famous Rift Valley and the high plateaux where the fierce, bloodthirsty Masai once reigned supreme, are now becoming colonized by the white settler. It has often been proved in other parts of the globe that the native, on the advent of the white man, alters his habits or ceases to exist, and it is to be hoped that the Masai will choose the first of these alternatives.

A. C. HOLLIS.

NAIROBI,
EAST AFRICA PROTECTORATE,
May, 1904.

[1] Ol-omeni means He who is despised. When this name was given him, he was a small, sickly child, and not expected to live.

1: Hollis G-5 (ca. 1894-1904) 1905
FL12 Masai FL12

claim to belong to them live elsewhere. Merker gives as the principal divisions three provinces, Kisongo, Loita, and Olbruggo. This is perhaps not according to Masai traditions, but is not incorrect as a practical description of the present distribution of the tribe. The Loita and Olbruggo, also known as Elburgon and Purko, are both subdivisions of the Naivasha district, of whom the former acquired importance by refusing to accept the present Laibon, Lenana, and following instead his brother Sendeyo. Besides these districts, there are four clans representing genealogical not territorial divisions: Aiser, Meñgana, Mokesen, and Molelyan. The Aiser seem to enjoy a certain primacy. The medicine men all belong to this clan, which is specially connected with Mount Ngong (to the south of Kikuyu), also called Ol-doinyo loo-l-Aiser, the mountain of the Aiser.

According to the social system of the pastoral Masai the male sex is divided into boys, warriors, and elders. The first stage continues until circumcision, which may be performed any time between thirteen and seventeen, or sometimes in the case of poor people not till twenty. Those who are circumcised about the same time (see p. 261 for details) are said to belong to the same age, and are known collectively by a distinctive name, such as 'the White Swords' or 'the Invincibles.' After circumcision the warriors plait their hair, but, except for a small skin hanging over the shoulders, and their arms and ornaments (which are described by Mr. Hollis), go absolutely naked. They subsist entirely on meat, milk, and blood, and in particular may not smoke or touch intoxicants. They do not live with the married people, but in separate kraals with the immature unmarried girls, with whom they are allowed to cohabit freely. Tradition[1] (see p. 117) ascribes this practice to the fear that if girls were kept away from the society of their own warriors, they would let themselves be seduced by the enemy; but the remedy has been worse than the danger it was to avert. The direct physical evil is considerable, and is partly responsible for the diminishing numbers of the race. Besides this, female morality after such a girlhood was naturally low, even when the Masai kept to themselves. Now that they have come into contact with civilization, prostitution and venereal disease have become deplorably frequent. About the age of twenty-seven or thirty, or nowadays when raiding is forbidden somewhat earlier, a warrior marries and settles down. If he

[1] It is said that among the Dinka, Bari, and Shilluk there are similar customs of free love.

SUBSTANTIVES

Plural.	Singular.	English.
Il-ojoñga	Ol-ojoñgani	The fly.
Ing-ojoñga	Eng-ojoñgani	The mosquito.
I-samburumbur	O-samburumburi	The butterfly.
I-sarambalan	E-sarambalani	The bat, swallow, swift.

Examples of other words which belong to this class:

Il-airakuj	Ol-airakuji	The kidney.
Il-ala	Ol-alai	The tooth, tusk.
Ing-atambo	Eng-atamboi	The cloud.
Il-til	Ol-tili	The spark, stain.
In-garara	En-gararai	The quill.
In-giporo	En-giporoi	The scar.
In-guruon	En-guruoni	The ash.
Il-keko	Ol-kekoi	The thorn, thorny place.
Il-kidoñgo	Ol-kidoñgoi	The tail.
Il-kilileñg	Ol-kilileñgi	The sheep's dung.
Il-kiyo	Ol-kiyoi	The tear.
Il-mao	Ol-maoi [1]	The twins.
Il-meneñga	Ol-meneñgani	The corpse, spirit.
I-mōsor	E-mōsori	The egg [2].
I-ñgok	E-ñgoki	The sin [3].
Il-ōkidoñgo	Ol-ōkidoñgoi	The mud.
Il-paek	Ol-paeki	The grain or cob of maize.
Il-pisya	Ol-pisyai	The chain.
I-seghera	O-segherai	The cowry.
I-seghenge	E-seghengei	The iron wire.
I-suut	E-suuti	The dust.
I-senya	O-senyai	The sand.
Il-tian	Ol-tiani	The bamboo.
Il-tuduta	Ol-tudutai	The boil, abscess.

Exceptions.

There are only a few exceptions to this rule. They are as follows:

Il-Maasse	Ol-Maasani	The Masai [4].
Il-Aisungun	Ol-Aisungui	The European [5].
Il-Musungu	Ol-Musungui	

[552]

[1] Ol-maoi means a child who has a twin brother or sister. [845]

[2] A large egg-shaped cask used for beer, &c., is Ol-mōsori, pl. Il-mōsorin. [415]

[3] An unlucky child, or a dwarf, is E-ñgoki, pl. I-ñgokin.

[4] The original name of the Masai is said to have been Il-Maa (sing. Ol-Mái), and one even now occasionally hears old people using this word, especially when relating stories of former times. According to tradition the present form dates from the introduction by the Swahili traders of a certain kind of bead called 'Sae or 'Saen (sing. O-Saeni). [101] [177]

[5] Europeans, or white people, were formerly called 'L-ōjuju, the hairy ones. This appellation was afterwards changed to 'L-Ailungun, a corruption of the Swahili word Mzungu, which in its turn gave way to the present forms. [186]

[113] [191] [194] Sir H. Johnston, in commenting upon this, says (*The Uganda Protectorate*, p. 803): 'It may be this explanation has been invented recently to explain a very ancient custom inherited by the Masai from the Nilotic stock, which was their origin; for amongst these people the removal of the lower incisor teeth is a very common practice.' Hinde's explanation, however, appears to be very widely spread.

[191] [1] This very uncommon practice for women to shave their heads is also followed by the Dinkas, Baris, and Latukas (Cummins, 'Sub-Tribes of the Bahr-el-Ghazal Dinkas,' *Journal of the Anthropological Institute*, June, 1904; and Baker, *The Albert Nyanza*, p. 90, &c.).

Spitting.

The Masai have two ways of spitting; one is used to show contempt, and the other astonishment. Besides this the medicine-men spit when they wish to heal people[1]. 201

If a Masai wishes to show his contempt for another man, he expectorates a small stream of saliva forcibly through the hole in his teeth into the man's face, and says at the same time: 'You are a dog.'

Formerly when the Masai saw Swahilis, they used to spit on the ground and say: 'These coast people stink like fowls.' They never went near them or touched them if they could help it. [177]

When a Masai sees a baby that he has never seen before, he spits on it slightly several times and says: 'Grow, become accustomed to the eyes of people.' 514 789 [856]

When he sees a child that he has never before beheld, he also spits on it slightly, and says: 'This child is bad.' To himself, however, he says: 'This child is good.' It is believed that if he praises a child it will fall ill. [753]

[1] Amongst the Dinkas it is also customary for the medicine-men to spit on their patients (Kaufmann, *Schilderungen*, p. 128). [171]

[2] The name by which the Swahili were formerly known.

When the Europeans came to these countries and the Masai saw them for the first time, they used to spit, for they said: 'We have never seen people like these.' They also called them medicine-men, and if a European gave a Masai medicine, the latter asked him to spit on him to heal him. Europeans were formerly called 'L-Ojuju owing to their being hairy.

[1] *Vide* p. 287.

[191] [113] [2] It is customary amongst the Bari people for old men (fathers or grandfathers) to take children's heads between their knees and spit slightly on them to bless them (Mitterrutzner, *Die Sprache der Bari*, p. xvi).

AN ADMINISTRATIVE AND POLITICAL HISTORY

OF THE

MASAI RESERVE.

CHAPTER I.

THE CHARACTERISTICS AND TRIBAL ORGANIZATION OF THE MASAI.

Peculiar policy necessary in dealing with the Masai—Why this peculiar policy is necessary—The tribal formation of the Masai—Social system of the pastoral section—"L-Ayok"—"Muran"—The effect of the military organization—The medicine-men—The Laibon—The Masai as a stockman—Employment of the Muran—Masai conservatism respecting cattle—Councils of Elders—Crime in the Masai Reserve—Divisions—Masai Council—The Tribal Divisions—Purko—Loita—L'Otayok—Salei—Siria—Il Damat—Kakonyukye—L'Odo Kilani—Nguruman—Matapatu—Sighirari of the Engidongi—Il Dala Lekutuk—Kaputiei—Sighirari of Laitokitok—Wandorobo—Il-Kunono—Recapitulation.

000

WITH a view to the better understanding of the steps which have already been taken and of the policy which has in the past been pursued in dealing with the Masai situated within the limits of the East Africa Protectorate, it appears desirable, in the first instance, to recapitulate concisely the facts which have at various times been recorded on the subject of their tribal characteristics and peculiar organization, attributes which have rendered it impracticable to carry out in their case the policies which have been adopted in dealing with the majority of other tribes in the Protectorate. These policies, established and maintained for the most part by the senior administrative officers in each Province, have undoubtedly not been uniform, but they have to a large extent achieved the result which is noticed in the majority of the native administered areas to-day, of developing the native inhabitants of the Province into useful agricultural labourers fit for residential work on European farms and available for duty on works of public utility, and they have also, by maintaining the system of self-government recognised by each tribe, produced within the reserves, a type of native so well under control that the demands of the military authorities, large though they were, for natives to serve as porters in German East Africa were met from these Provinces without disturbance of any kind, in spite of the fact that compulsion had to be resorted to and that the work was unpopular, and, furthermore, they have so developed the system of native administration that the majority of the porters so recruited were obtained by the native authorities themselves without the aid or intervention of the European administrative officers. The Masai were among the first tribes which came into contact with the administration but their conservatism has been so great, and their subservience to antiquated tribal custom and tradition has been so powerful that it has proved impossible as yet materially to alter and renovate their ideas.

Peculiar policy necessary in dealing with the Masai.

648* 177

[181]

The Masai are a Nilotic people, closely allied to the Nandi and Lumbwa and to the Suk and Turkana. In common with those other four tribes, they possess a form of military organization which obliges all the male population between the ages of about seventeen and thirty to submit to a special discipline and to constitute a warrior class. It is, however, impracticable for the purpose of policy to compare the Masai with either the Suk or the Turkana, which tribes have only recently come into touch with the Administration, and a comparison with the Nandi and Lumbwa, Buret and Sotik, discloses a position markedly unfavourable to the Masai. Though none of these former tribes has definitely

Why this peculiar policy is necessary.

101

648* 177

*648
179

discarded their old formations, adversities of various descriptions have introduced the necessity of undertaking manual labour in portions of each reserve and a succession of punitive expeditions or displays of force, the last of which occurred some ten years ago, has brought home to them a conception of the power of the Government, a realization which has tended towards a more progressive attitude owing to the diminution which it caused in their minds of the influence held by their medicine-men. No punitive expedition has ever been undertaken against the Masai, an omission which was very largely due to the authority and sagacity of Lenana, the chief medicine-man at the time when the European Government was first encountered, who survived long enough to keep his people in check until such a degree of administration had been effected as to render the despatch of a punitive expedition a measure that would only be resorted to in the last extremity. Further, the Masai now thoroughly realize how vulnerable they are if ever they come into armed conflict with the Government. Their enormous, immobile herds would immediately be lost and a sufficient degree of punishment could quickly be attained. For this reason, it is extremely improbable that they will, of their own initiative so far forget what they consider to be their best interests as to cause a serious disturbance. The escape from punitive expeditions, however, has undoubtedly been a factor in the perpetuation in their original form of the Masai ideas and traditions.

101
184
578
628

The tribal formation of the Masai.

As will be seen in Chapter II., the Masai tribe originally consisted of both pastoral and agricultural sections, of which the latter was almost annihilated by the former and survives at present only in one or two scattered localities, mainly in areas reserved for other tribes. A small section of these agriculturalists, the Nguruman, is to be found at the north end of Lake Natron, but that is the only trace of them in the present Masai Reserve, and these people now show a tendency to assume the habits and customs of the pastoralists. The problem presented in the administration of the Masai is therefore almost exclusively concerned with the pastoral section. According to the social system of this section, the male sex is divided into boys, warriors and elders. The first stage continues until circumcision, which may be performed approximately between the ages of thirteen and seventeen. These boys are called "L-Ayok." After circumcision, they become warriors, or "Muran," those who have been circumcised at about the same time being said to belong to the same age. The "Muran" remain on the fighting strength of the tribe for periods varying from seven to fourteen years, during which period they constitute a standing army. They are divided into Companies, or "Sirits," which live in separate villages, or "Manyattas," some of these containing as many as six or seven hundred fighting men. With few exceptions, the "Muran" of the present day perform no work of any kind. In days gone by, they were expected to carry out raids and preserve the armed prestige of the tribe, but the introduction of the "Pax Britannica" has deprived them of such employment, and they, having found no alternative occupation, are content to remain in idleness and to live in the state of free love with immature girls which tradition prescribed as the duty of the warrior in the days of tribal warfare.

561

Social system of the pastoral section.
"L-Ayok."
"Muran."

The effect of the military organization.

This military organization of the Masai made them, in the past, a most effective body for destructive military operations, and explains not only the predominant position which they acquired in East Africa, but also the respect which they inspired and the extent to which their customs were imitated by other tribes. On the other hand, it probably also is the reason why they never founded any state or polity analogous to the Kingdoms of Uganda and Unyoro. The centre of political gravity was not with the elders or chiefs, but with a republic of young men, governed by ideas of military comradeship and desirous only of military glory. Retirement from this band of warriors as a chief was honourable, but seems to have been regarded as a removal to an inferior sphere of activity. The chiefs arranged the details of the raids which the warriors wished to undertake, but their power of compelling them to do anything which they did not wish was very slight.*

561
642
622

* Sir Charles Eliot, November, 1904, Introduction to "The Masai: Language and Folklore," by A. C. Hollis.

181 464 561 **Employment of the "Muran."**

More particularly does this argument apply to the "Muran" who are of the ages at which the members of agricultural tribes are expected to work. No suitable employment has as yet been found for them as a body, though a small number have been known to reside as herds on the farms of sympathetic European stock-owners who are willing to pay a high wage for a modicum of service and who will not insist on their performance of any uncongenial labour. A very few also have proved efficient in the Police Force and K.A.R., while numbers of them, employed in the capacity of native levies have frequently proved of assistance in punitive expeditions against other tribes,* but for the majority, all attempts to find a suitable form of employment have failed, and they continue to lead their idle life in the Reserve, where their attitude is one of conceited conservatism combined with opulent apathy. The discipline formerly necessary to their existance as a fighting race is rapidly falling into disuse, and the good qualities they once possessed are fast deteriorating. Many of them have confessed to a feeling of boredom with their idle life but few have had the moral courage to change it for one of labour. This manner of existance is having a disastrous effect both physically and mentally on the Masai as a tribe, and it is stated that the average height of the "Muran" has decreased by three or four inches during the last fifteen years.

181 232 233 197 **Masai conservatism respecting cattle.**

It has been said that the Masai Reserve is already, with certain reservations, stocked to its fullest capacity. Mr. Hemsted has estimated the natural increase in cattle at 15 per cent. or approximately 100,000 per head per annum. It follows therefore, that a similar number must be disposed of or perish annually; but this is an argument which does not appeal to the Masai. They have not only shown a marked reluctance to sell their stock, but they have made no serious attempt to accept the assistance of science in improving the grazing conditions of their country, and, being satisfied as a result of the few experiments they have made that the class of stock they possess—a small, degenerate, in-bred animal—is best suited to withstand the ardous conditions prevailing in the Reserve, they are unwilling to permit a cross-breeding with pure-bred or grade stock which might materially increase the value of their herds in the world's markets, and which would, by the introduction of fresh blood, obviate the ill-effects of in-breeding which has been rendered necessary by the cessation of raids. The wealth of the Masai, therefore, is turned to no good purpose; their style of living does not change; they are still content to live in low buildings constructed of poles, grass and mud, in conditions of filth that defy description; and, although an improvement has been noticeable in recent years, they have shown no great desire to utilize their wealth in the purchase of imported articles and in the improvement of their diet.

623 561 **Councils of Elders.**

Another aspect of the character of the Masai "Muran" which deserves consideration is the disregard which they evince for the authority of their own native administration as represented by the Councils of Elders. These Councils exist according to native custom, but have never been in the past, nor are they now, efficient to enforce the decisions they may give in respect of the young warriors. It may be said that serious crime in the Masai Reserve is rare, and that there are not more than three or four cases on record, since European administration was established, when the attitude of the "Muran" gave cause for anxiety and in no one of these cases did a disturbance of such magnitude occur as to render necessary a recourse to armed force to quell it. Politically, the Masai have remained loyal to the British Government since they first encountered it, and except for isolated instances where certain sections attempted to help the allied cause and to increase their herds by the despatch of raiding expeditions against German territory, their conduct throughout the trying period when the war in East Africa was on their borders was exemplary. Nevertheless, a catalogue of the misdeeds of the Masai will show a not inconsiderable number of instances

[674] **Crime in the Masai Reserve.**

648 674

* The Masai have rendered assistance in the capacity of native levies on the following occasions:—

(1) Nandi Expedition, 1899. 40 Muran.
(2) Nandi Expedition, 1900. 400 Muran.
(3) Maruka Patrol, 1902. 300 Muran.
(4) Tetu Operations, 1902-03. 300 Muran.
(5) Irisai Patrol. 400 Muran.
(6) Kabwaren Patrol, 1904. 100 Masai and Nandi.
(7) Sotik Expedition, 1905. 400 Muran.
(8) Kisii Patrol, 1905.
(9) Nandi Expedition, 1905-06. 600 Muran.
(10) Present Turkana operations.

Reports on the work of these levies have on the whole been highly satisfactory, except in the present Turkana operations where it is doubtful if the pastoral Masai have been used, and in the Kabwaren patrol, where it was found that the Masai spearmen were of little use against the Nandi in forest country.

Chapter II.

EARLY HISTORY OF THE MASAI.

173 **Origin of the Masai.**

Little is known of the early history of the Masai tribe, but it seems to be an established fact that the original home of this people was the country between the north of Lake Rudolf and the Nile, from which area the Masai are said to have moved in a south-easterly direction so long ago that tradition does not recall any incidents of the exodus, nor the reason therefor.

101 173 **Pastoral and agricultural sections.**

It seems, also, that there were two distinct sections of the Masai, distinct in point of habits of life and customs, though not of language or ancestry, between which sections continual war was waged, wars which now form the greater part of the traditional history of the tribe as it is known at the present day to its members. The sections are usually defined as the agricultural and pastoral sections, the former, known as 'L-Oikop, being more or less settled, while the latter was entirely nomadic, and never practised agriculture in any form. Masai tradition does not extend back for more than one hundred years, but the history of that century shows, to the exclusion of all other topics, a conflict between these two sections, which resulted in the practical annihilation of the 'L-Oikop, who have now ceased to exist, with the exception of small settlements found at Nguruman, to the north of Lake Natron, two villages, Great and Little Njemps, to the south of Lake Baringo, possibly the so-called Uasin Gishu Masai, now located near Eldama Ravine, and in Kavirondo country, and certain individual settlements of Masai among neighbouring tribes, where they have assimilated the customs and adopted the language of their protectors, and from whom it is now difficult to distinguish them.

[361]

Settlements of 'L-Oikop.

174 114 **Sir Charles Eliot's theory.**

The theory suggested by Sir Charles Eliot, is that the nomad pastoral state cannot be assumed to be primitive or very ancient, and that it is quite probable that there was a large agricultural settlement on the Uasin Gishu plateau, from which the more adventurous of the warriors detached themselves.

177 **European influence.**

It is this conflict which made the Masai name what it was and which has rendered so complex the question of the administration of the conquering pastoral section. The victors depended entirely on cattle for their means of subsistence, and were driven to raiding other tribes, in order to amass sufficient herds of cattle. The introduction of the European element, therefore, deprived the Masai of their one pursuit, and had the inevitable result of reducing the Masai from the first to a very low rank of economic importance among East African tribes.

[921]

101 **Wakwavi.**

The term Wakwavi (Wakuafi of Krapf) is frequently used by the early writers in reference to the Masai, but it appears that this term has, in fact, no connection with the agricultural section, being merely a Swahili nickname borrowed from the Masai Kwavi or Kwapi, meaning places.

It is possible that much of the mortality attributed to East Coast fever is really the result of a disease known as heart water, which is described as a tick-borne disease, very similar to East Coast fever. There is as yet no evidence to support this idea. Heart water. 648* 231

East Coast fever appears to be the only cattle disease which the Masai really fear, and is, in fact, the disease which causes by far the highest mortality among their herds. Nevertheless, they have not come forward very readily to make use of the cattle dip which was erected at Ngong in 1914, and it is evident that, in addition to the superstition which prevents them from taking advantage of such an innovation, they are also too slack and listless to go to the trouble of making the treatment a matter of regular routine. In time, however, it is to be hoped that they will come to appreciate more fully the immunity which dipping confers upon their stock, and, when this realization has been arrived at, it will follow that large tracts of otherwise suitable grazing areas will become available within their reserve for them and their stock, thus tending to relieve the congestion which is now noticeable in those parts of the reserve which are considered by the Masai to be suitable for their cattle. Dipping. [181]

(E) Foot and Mouth Disease.

Foot and mouth disease has not given serious cause for anxiety in the Masai Reserve. An outbreak was reported in June, 1917; and in February, 1918, it was said to be very prevalent in the majority of the villages situated in the Narok and Mara districts. Accordingly, in that month, the Chief Veterinary Officer prohibited the removal of sheep from the reserve.

The direct mortality from this disease is slight, but it very seriously affects the milk supply, and indirectly it causes a certain amount of loss, as infected animals, being in a weak state, are unable to move about sufficiently to obtain the necessary and adequate grazing, and, as a consequence, they may die of starvation.

The disease was reported in May, 1918, to have practically died out.

(F) Rinderpest.

Rinderpest has been enzootic in the Masai Reserve for many years and the majority of adult Masai cattle are immune. It was rife in the Northern Masai Reserve from 1910 until the completion of the move in 1913, and several outbreaks in both the Northern and Southern Reserves were reported between November, 1912, and January, 1913.

Anti-rinderpest inoculation was carried out where practicable and a large number of Masai cattle were thereby protected, with the result that the mortality was very low.

For the next five years rinderpest lay more or less dormant, but it became unusually prevalent early in 1918, and heavy mortality ensued among the calves, of which it was estimated that about fifty per cent. of the annual increase succumbed.

The Masai have proved to be opposed to the treatment of their cattle by inoculation against rinderpest, as they prefer that immunity shall be obtained by the natural process of the survival of the fittest. [232] [177]

(G) Tsetse Fly.

During the tour undertaken in October, 1911, by the Director of Agriculture, accompanied by Messrs. Hill and Chaplin, the Director of Public Works and the District Commissioner, South Kavirondo, no signs of tsetse fly were seen along the route traversed, and the cattle met with did not appear to be troubled by the ordinary biting fly. On a previous visit the Director of Agriculture had noticed a number of "Stymoxys," and he stated that this fly was fairly common all over the Protectorate, but that so far as was known it did not carry any cattle disease. Tours by the Director of Agriculture.

*648
231

essential problem before the Government at the present time in dealing with the Masai is how to turn this annual increase into a realizable asset. The proposals for imposing upon the Masai a tax of two rupees per head of cattle per annum, approved by the Governor in January, 1918, fell through mainly owing to the impossibility of procuring a market for the quantities of almost worthless stock that would have been produced in payment, and it is difficult to see how this objection is to be overcome unless some much more marketable commodity is produced. Purchase by local residents and firms of the kind of Masai stock that would come in as a result of the imposition of such a tax would in all probability be very limited in extent, and no business firm has yet come forward with proposals for taking over such stock for canning or export by other means. It has not yet been proved or disproved that such Masai stock is marketable for the purposes of human consumption, but it is a fact that much of the stock from the Masai Reserve produced for slaughter by the military authorities was returned as unsuitable, and while it is extremely improbable that the Masai would be able to pay their tax in cash, it is only reasonable to expect that the worst stock would be paid in in lieu of cash where that was unobtainable.

Taxation.

Problem of taxation.

The problem, therefore, appears to be as follows. If the necessary staff is provided, a tax can be collected from the Masai at the rate approved which will bring in stock assessed at £100,000 annually. Of the money realized, £50,000 is to be devoted to works in the Masai Reserve which will so improve the conditions therein as will not only render it capable of maintaining a larger number of stock, but will also so alter the conditions as to make it probable that a higher grade of cattle could be supported in the reserve. When this last step has become effective, it may reasonably be assumed that a market will be forthcoming for the cattle paid in as a tax, but it is not yet proved that it will be possible to realize the value of the stock collected in the earlier years. A trial alone can demonstrate this.

*648

Masai as an asset to the Protectorate.

Enough may now have been said on the subject of the potentialities of the reserve, but it must also be borne in mind that, of the proposed cattle tax, one half of the proceeds are to be paid into the general revenue of the Protectorate, and that it is a matter of concern not only to the reserve, but to the Protectorate as a whole, that the proceeds of the tax should be forthcoming in the shape of a realized asset as soon as opportunity occurs. The Masai have hitherto paid a hut tax at the rate of three rupees per hut, which sum, amounting to less than £3,000 per annum, has not covered the cost of their administration, but the proposed tax will not only cover the cost of the administration of the reserve, but will leave a considerable balance for the general development of the Protectorate, while the needs of the Masai Reserve can be attended to to the fullest extent of which the staff is capable.

[651]

461
464

Masai residing in the reserve.

Of the Masai residing within the reserve, the most that can be expected of those who are not tending cattle is that they will help in the performance of the public works which are destined to be undertaken therein. Hitherto they have not been employed on such works, as manual labour does not appeal to them, and it is indeed doubtful if such a change will be brought about in their temperament as to induce them to perform this. That the position may not be hopeless is perhaps suggested by the fact that certain sections of the Somali tribe who had until recently maintained an attitude similar to that adopted by the Masai, commenced manual labour last year, and a corresponding change for the better may still occur among the Masai.

177
[791]

Future of the Masai.

Conditions have so greatly altered in the Masai Reserve during the last few years that the power of the medicine-men as a class has greatly decreased. The insistence on education for the Masai may further enlighten them, may undermine their conservatism, and may encourage them to discard their prejudices. An organized movement to show the Masai the development that is going on around them and to drive home to them the fact that unless they progress they are bound to disappear in the circumstances attendant on the introduction of civilization may have its effect in eventually bringing them to a conception of their duty. The Masai problem has not yet been tackled, but the prospect of rendering them useful citizens of the Empire is not entirely without hope.

7: Hailey G-4 (No date) 1950 FL12 Masai FL12

695 the forcible execution of decrees for the custody of women and children in a manner repugnant to the principles of humanity.

CONCLUSION REGARDING THE VALUE OF THE SYSTEM NOW IN FORCE

000 Looking at the system of native administration in Masailand as a whole, those who are now most closely concerned with it regard the position as far from satisfactory. Consideration has lately been given to a number of changes in detail. It has been proposed that there should be a Masai Council at Ngong, consisting of the 20 members selected from the two Local Native Councils, which would deal with all questions affecting the whole of the Masai, leaving the two Local Native Councils to deal with purely local questions, such as applications for trading plots or the expenditure of local Treasury funds. This would no doubt be a simplification of the present procedure, but it will be realized that the existing method of constituting the Local Native Councils, while designed to secure a representation of the tribesmen in general, has the effect of excluding the Headmen who carry most weight with them.

A scheme has also been considered for making a more definite delimitation of the Section boundaries, in order to enable the formation of Committees of Control over grazing, and to assist the introduction of a system of destocking. It is difficult to estimate the extent to which the soil in the Masai Reserve actually suffers from deterioration owing to overgrazing, for as has been pointed out, the facts are complicated by the existence of the great quantity of game in the Reserve.[1] There is no doubt, however, that the scheme referred to would be of benefit both from the administrative and the economic point of view, though its success must depend on measures to be taken for the improvement of water supplies, without which the delimitation of Section boundaries would be ineffective.

● 177 But the causes which have produced the present situation in Masailand are deep-seated, and a remedy cannot be found merely in changes in the present system of native administration. The chief obstacle to progress among the Masai is the persistence with which this conservative people have clung to customs and habits of life founded on the militant traditions of the past. Some effort has been directed to effecting changes in their custom, in particular as regards the position of the Moran. At the instance of the first Provincial [656] Commissioner (1911-1923) the tribe was forbidden to continue the warrior manyattas and the cohabitation of Moran with unmarried girls was also interdicted. More recently, a meeting of the Chiefs and Elders held at Ngong in 1947 agreed in principle that the period determining service as a Moran should be reduced to three years, and there is a further project for establishing Moran camps, which it is hoped may serve as an education in a more useful form of life.

000 It perhaps adds to the difficulty of effecting an improvement in the condition of the Masai that the problem has been viewed from two different standpoints by Europeans in Kenya. There are some, both officials and non-officials, to whom certain aspects of the Masai character have always made a strong appeal. They have in particular been attracted by the courage, frankness, and loyal sense of comradeship shown by the Morans. On the other

[1] See page 10 of the Report on the Financial Position and System of Taxation of Kenya, Col. No. 116, 1936.

Kisonko

are in for a bad time." That is sufficient to ensure that a deputation from Moibo will visit him without delay. 791 789

Apart from specific payments for age grade matters, and the ceremonies obtained thereby, all the elders of an area are supposed to benefit from the performance of these local ceremonies, and consequently are expected to pay. It is an accepted practice that the Dalala age should not give cattle to be taken to the laibon, but are expected to provide hospitality for the meeting which is called to decide who shall contribute. At the meeting proceedings may begin by a man being denounced for refusing hospitality to an age-mate, and so in effect fined. Otherwise the matter is one for general discussion, X pointing out that he gave a beast last time, Y drawing attention to the fact that Z has not helped for many years, and so on. 791

These details have been included under the heading "Modern Adaptations," since one is so frequently assured that in the old days no such levies were made. It is asserted that the only occasions on which boma to boma levies were made was when a party of moran returned from a raid empty-handed, and were so ashamed that they collected beasts from amongst themselves to take to the laibon.

Another demand which a laibon makes on his followers is that he should be provided with wives. Some elders say that this is an age-old institution, others that it is a recent innovation. Be this as it may, motor transport is an innovation, and by getting round the country more, the laibon sees a greater number of suitable women, and consequently increases his demands. Parrit (15) is credited with collecting five girls as a result of the safari he went round South Masailand when the boundary was demarcated: the Dwati paid the dowry and arranged the weddings. Mbeiya (17), on a safari to Kibaya in 1937, demanded and was given the daughter of Lemauna, although she was engaged to another; Kapurwa (23) paid one beast towards the dowry and contributed the ram-skins for the wedding garment. When the girl was brought to Mondul, a number of milch cows were presented to form the nucleus of her herd. On the same trip, Mbeiya demanded and was given one girl from Simanjiro and another from Losogonoi. Taiko (18) is also alleged to have tried his hand at the same game, demanding the daughter of an old man at Sanya; the father asserted that it was just an ordinary marriage, but local Masai opinion thought otherwise. For when a girl is married to a laibon, she is regarded as lost to her family and clan. The usual relationship which marriage sets up between in-laws does not exist; one cannot approach a laibon for assistance as one can an ordinary son-in-law, nor can one expect a laibon to let either one's daughter or her children go home on protracted visits. 791 595 [177] [588] [614]

The introduction of Pax Britannica and of motor transport makes contact between the Masai medicine men and alien witch doctors much more possible. There always seems to have been a close association between the Kikuyu and the Engidong clan, so much so that we may reasonably suspect that the heaven-sent child ol-le-Mweiya was merely a Kikuyu impostor. But if, as one gathers, the Masai and Kikuyu were 791 177 494

9:Fosbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

781 frequently fighting, contact must have been limited. But that is not the case to-day. When Mbeiya's boma was infected with measles in 1935 177 he hired a lorry and himself travelled to Nairobi and beyond, bringing 494 back a Kikuyu medicine man to cleanse his boma for him. Kutata (24) is reputed to have obtained a charm to kill Mbeiya from a Sukuma witch doctor in Pare, and Letinga (25) and Balosi (26) hired a car to go and interview this doctor, in order to verify the rumour and/or to obtain charms stronger than those given to Kutata.

781 The cult of the laibon must therefore have much in common with the beliefs and practices of neighbouring tribes, and I put it forward as a possibility that, with further contacts, the institution may eventually end up merely as an instrument of common witchcraft.

771 In the absence of rational scientific explanations for the many natural phenomena which surround them, — drought and disease, fecundity and 781 sterility, birth and death, — it is natural that the Masai, in common with all other primitive peoples, should regard the unseen with deep fear and [781] awe, and grasp at any opportunity offered which purports to control these mysterious factors in their lives. They believe the laibon to be capable of controlling these unseen forces; he is the intermediary between themselves and the supernatural. His blessing will assure prosperity, his charms and rituals can alleviate an existing calamity, and his power of foretelling the future enables steps to be taken to ward off an impending catastrophe.

It is extremely difficult to ascertain the strength of these beliefs amongst individual Masai, but it is considered that the majority of the Kissongo hold them implicitly. Some areas, e.g. Kibaya, have a reputation for consulting the laibon more frequently than others, but none the less the beliefs are general. The practice of the ritual may fall into temporary abeyance in certain areas, but the belief remains, and manifests itself in outward form on the advent of a drought or of a personal reminder from the laibon. Modern contacts have as yet done little to shake these beliefs. A few Christian Masai are completely sceptical; others may have their doubts, but when the occasion arises feel that they had better do 561 what they are told, 'to be on the safe side'. One of the chief factors 771 which guarantees the maintenance of these beliefs is the age grade system. 791 From early adolescence the future leaders of the tribe, the *laiguenak* and *ingobir*, are frequently taken to the laibon by their guardians, the *il piron* elders. The lengthy discussions beforehand, the actual journey, the reverential attitude of the elders to the laibon, the ritual, the mysterious voice in the darkened hut foretelling the future, all these must make a deep impression on the youths. This in turn is spread to the rest of their age-mates when they return home and perform the ordained ceremony.

There seems little doubt therefore that so long as the age-grade system is maintained in its present form these beliefs, and the consequent power they give the laibon, will be perpetuated. True, as education progresses, this power will decrease, but disbelief will dissociate a youth from his age-mates, and consequently his influence on others will be small; on the

12: Fox G-5 (1925-1930) 1930 FL12 Masai FL12
Kenya

As stated above, *Ol Piron* means a firestick. I have been given a reason for the use of this term, but was not convinced of its truth. The elders of the *Ol Piron* generation stand in a particular position of guardians to their juniors who recognise their authority to a far greater extent than they do that of elders of other generations. This relationship has considerable political as well as domestic importance. 561

Manyattas.—The *siriti* is the unit for a single *manyatta*, except when the whole age-group of a single area combine to form one *manyatta* for some ceremony, *e.g.* the *E-Unoto*. 561 361 648

For some years the policy of Government was directed towards suppressing the warrior system, and *manyattas* were prohibited, each warrior being supposed to live in his father's village. With increasing control and understanding of the tribe this rule has been somewhat relaxed, and the warriors are now commonly allowed to have *manyattas* provided that they continue to behave themselves before the law.

But the general effect of Government policy has profoundly modified the original customs with regard to warriorhood, and it is now rather difficult at times to know exactly what these were. The main political effect is that warriorhood lasts for a much shorter period than formerly, and most men marry and become elders within four or five years of their circumcision. 361 177 361

Nowadays the parents are somewhat unwilling that the girls should live in the *manyattas*, and so there are only a few of them to be seen there.

A *manyatta* usually differs structurally from an elder's village in that it is simply a circle of huts without the usual thorn hedge round it.

Sex Life.—The word written by Mr. Leakey *tasiukiu* would perhaps best be spelt as two words *Tasioki iyook*. *Tasioki* is a second person singular imperative of a dative word (see Hollis, p. 77) which I have never heard except as described by Mr. Leakey. *Iyook* means "we" or "us." 836 [193] [114]

When a man has been accepted by a girl who has been so addressed he usually holds out his hand to her with the tips of his forefinger and thumb touching to form a circle. She is then supposed to break the circle so formed with her forefinger. This is regarded as making her acceptance binding. [201 832]

It is a great disgrace for a warrior to cause an uninitiated girl to conceive, and he must kill an enemy in order to wipe it out. This is, in fact, the usual reason for the occasional murders of people of other tribes, frequently ascribed erroneously to a desire on the part of the murderer to "blood his spear." 842 154

The E-Unoto Ceremony.—Nowadays this takes place from three to five years after initiation. It is not a single ceremony for the whole of the Masai, but there are a number of separate ceremonies according to the groups enumerated in my age-group table above. 561 884

12: Fox G-5 (1925-1930) 1930 FL12 Masai FL12
Kenya

561 894

warriors may have sexual relations with initiated women. This is regarded as being the first stage in a warrior becoming an elder.

The warriors have their heads shaved—usually by their mothers—at the close of the *E-Unoto* ceremony, but they allow the hair to grow again, and plait it into a pig-tail when long enough. [302]

Milk Drinking by Warriors.—A warrior may not drink milk unless it is handed him by another of his age-group. They must therefore always go about in parties of two or more. The procedure on arrival at a village where they want some milk is as follows :— 561 974 272

The warriors enter the village and stand in the open space within the circle of the huts till one or more of the old men comes to greet them. They ask for a hut of their age-group, or, failing that, a hut of an elder of their *Ol Piron*. On being shown a hut to enter they go in and sit down on a bed or the stool, and wait till milk is handed to one of them (for description of hut *see* p. 463 ff.) He shakes up the milk, removes the cap of the gourd, and hands it to his companion, who drinks it. If only one gourd is brought they share it, handing it from one to the other. If a second gourd is brought the warrior to whom the first gourd was originally handed may open it and drink it himself provided that he has given the first gourd to his companion. Belching after a drink of milk is a sign of repletion and is good manners, showing the guest's appreciation of the hospitality of his host.

Ol-Ng'esher of Milk.—This ceremony is performed by each warrior individually. He is given milk by an elder in his mother's hut, and drinks it by himself. He shaves his head and does not grow a pigtail again. Thereafter he may drink milk by himself. He usually marries very soon after this ceremony, and is no more regarded as a warrior after it. The ceremony usually takes place nowadays a year or two after the *E-Unoto* owing to Government policy of reducing the period of warriorhood as much as possible. In the Purko, most of the *Il-Salasak* have already performed their milk *Ol-Ng'esher*, although there is as yet no left-hand age-group for their generation. 561 [272] [302] [148] [177]

I have heard it said that in some tribes there is a ceremony of handing over warriorhood from one generation to a junior one. Among the Masai there was no such ceremony. When the young warriors of a new generation became strong enough they fought and defeated the old ones, taking on the warriorhood by force.

Meat Feasts.—No man may eat meat which has been touched by an initiated woman until he has performed the second *Ol-Ng'esher* ceremony, called the *Ol-Ng'esher of meat*. After that he may eat meat which a woman has touched if he likes. The Il Merutorut and Il Kitoip age-groups of the Purko were said to be going to have their meat *Ol-Ng'esher* in June, 1930; but I left Africa before it was due, and therefore cannot describe the ceremony. [262]

A man of the generation immediately older than the warriors must not be seen eating or drinking milk by a warrior until one of the warrior age has given him a heifer.

Functions of Laibons.—A *Laibon* is far more than a mere medicine man or purveyor of charms. His function would seem to approach more closely that of a chief priest of the Israelites, and the N-Kidongi sub-clan might be compared to the Levite tribe. 991

He is, or should be, the religious head of the tribe. No ceremony nor important enterprise should be undertaken without his blessing, in return for which he should be given a large present of cattle. He prays to God on behalf of the people. On one occasion Sendeyo arrived in my camp before sunrise, just as I was about to start on an excursion into the deep forest, and made a prayer for our safety. We stood round him and responded "*Na-Ai*" (= "O God") at the pauses; I was too much taken by surprise to remember the details of the prayer except that it was very impressive, and that he ended by giving his genealogy (see Hollis, p. 326) in order to show that the prayer was one which should receive attention.

The *Laibons* use charms (*indalingai*) for various purposes, and their employment is invariably accompanied by prayer to God. I have a few of the charms in my possession and have been instructed in their use, under promise not to reveal my knowledge. Sendeyo once said to me that a good heart was better than charms. [989]

Witchcraft.—Although the *Laibons* use charms, witchcraft, *i.e.* harmful magic, is not indispensable to their office. Some of them, however, are alleged to have made use of it. Witchcraft is not indigenous to the Masai. Such persons as I have found practising black magic in Masai country have learnt it from the Kikuyu of Nyeri District or from the Meru. 954 [199]

Religion.—The Masai believe in one God whom they call En-Gai, which is the same word as they use for rain. They say that God is one, but permeates everything. He may be prayed to as inhabiting a wood, a stream, the earth, etc., but He is all the same God. The Masai only use short prayers such as "Na-Ai" (O God) and "Na-Ai nikiar" (O God do not strike me) except for the prayers at *Il Pul* and those of *Laibons* already mentioned. Some, if not all, of the ceremonies have a religious significance, but I cannot give details without further experience. 991 996

Superstitions.—There are certain old trees with holes in them, in which a Masai puts a handful of grass or leaves when he passes. They have told me that this is equivalent to a prayer, "May I live to be old like this tree." 989

A traveller sometimes puts a stone in the fork of the branch of a tree near the track in order that he may arrive at his destination before nightfall.

There are a few places where the passer-by should tie a knot in the grass. I am uncertain of the reason for this.

When the new moon is first seen people pluck grass and throw it towards the moon, saying, "*Injiki o enon ol ondo nanisho ol dowp*"—"Give me the body which is long and I give you the short." I do not know the significance of this.

Kenya FL1

M (ii) *The Masai.*

10 The Masai are a pastoral tribe whose sole occupation is the tending
233 of large herds of cattle, sheep and goats. It has been estimated that they have about 25 head of cattle, and twice as many sheep and goats, per head of the population.

M The staple articles of diet are meat, milk, and blood. The blood
262 is drawn from the living animal by puncture of the jugular vein
261 with an arrow. Various roots and barks are used to make infusions
[263] which are used either with boiled meat or with milk. The men, while in the "moran," or warrior class, subsist practically entirely on these articles of diet. The rest of the population, in addition to these four items, which form the main part of their food, eat also some bananas, beans, millet, arrowroot, maize, sugar and honey, as
M these are available. The use of maize, which was introduced only
[177] a few years ago, is increasing.

For the greater part of the year there is no scarcity of meat, blood and milk, but in periods of severe drought, when, in spite of the large herds, the milk supply is inadequate, the consumption of these vegetable foods is increased, and even the "moran" may be compelled to supplement their meat and milk diet.

M Berries are eaten by the warriors when on safari, *i.e.*, on hunting
[484] or fighting expeditions. It appears also to be customary to send the
[843] pregnant women into the bush to eat berries. The berries would
[146] make an insignificant contribution to the main constituents of the diet, but it is probable that they are of considerable importance as an antiscorbutic addition.

M One section of the tribe, the Loitokitok, have adopted a frankly
[184] mixed diet. It is of interest that pica among the Masai is confined to this section, who use edible earths from various sources with their vegetable foods.

(*b*) Chemical Composition of Native Foodstuffs, Edible Earths, and Mineral Waters.

Ka The results of the chemical analysis of 153 samples of substances
M used in the dietary of the two tribes are given in Appendix I.
K Certain points of interest are discussed below.
146 (i) *Foodstuffs.*

In the following table a comparison is made between the analyses of the chief Kenya foodstuffs and analyses of similar products grown in other regions, probably in Europe or America, as quoted by Sherman (1926). All the figures are given as grams per 100 grams dry matter.

18: Merker--x G-5 (1895-ca.1908) 1910 FL12 Masai FL12

/xiii/

Foreword

by Professor Dr. Fritz Hommel, Munich.

114
773
171

The reports of the deceased Hauptmann /Captain/ Merker, causing a sensation in his time, about the legends of the Masai so remarkably connected with the Hebrew early history are even today still capable of arousing the most widespread interest. The question as to whether traditions preserved for millenniums from the Arabian original homeland of the Masai people actually exist here or whether a Christian or even Jewish influence is not still to be assumed has not yet been silenced. As is known, Merker himself was unshakably convinced of the absolute impossibility of the latter assumption, and even if such an influence had nevertheless taken place, which is highly improbable in view of the reasons cited by me below, it could only have happened in the early period when the Masai were still living in the north, in the neighborhood of Abyssinia, which, however, also serves again as the basis for strong scruples.

114
177
797
773

First of all, mystification on the part of Merker, whose reliability is beyond all doubt, is completely excluded. Actually, it was only after a long acquaintance with the Masai of his region that he gained the confidence of those old Masai men who finally imparted to him the traditions otherwise anxiously kept from strangers; the distinguished Masai expert, our Bavarian compatriot Deeg, and furthermore African experts such as Schillings and Dr. Sander, are equally firmly convinced that Christian influence through the missionaries working there for only a comparatively short time, toward whose efforts the warlike and proud Masai have been very intractable up to now, is quite inconceivable. If the English Masai-missionary Albert R. Steggall, who was active there 1889-1905, says in the Expository Times, XVII, June, 1906, p. 429, that
[115] Mr. A. C. Hollis, this eminent authority on the Masai living in British East Africa, related to him from a Masai boy in his service, "that the Masai from whom Captain Merker got much of his information was for some years, during the Masai famine, connected with a Roman Catholic Mission in the neighbourhood, as indeed were many others, besides those who came under instruction

/xiii cont./

114 in the Church Missionary Society's station in Taveta" /cited in
• 177 English/, this, as Merker himself told me, can only refer to a
773 Masai man from whom he received other information: since for
797 the many investigations on /xiv/ which his ethnological work is
[115] based (habits, customs, names, etc. etc.), he had quite different
114 informants, of course. And Hollis' objection (1)
773

> 1. Personal communication from the researcher, highly esteemed by me, whom I had the good fortune to become acquainted with in September, 1908, in Oxford (at the Kongress für Religionsgeschichte /Congress on the History of Religion/), just as I was also able to become personally acquainted with the deceased Merker in 1907, after I had previously corresponded with him, which was extremely valuable to me in view of the so highly controversial Masai problem.

that he (Hollis), who was also acquainted with the Masai of his region for many years, would then also have had to come across the traces of such early history is only an argumentum e silentio. Either the more southerly Masai (in German East Africa), with whom Merker worked, were more faithful guardians of those ancient treasures, which is not impossible, or Merker also had more luck in gaining their confidence on this point than Hollis, who, just there, did not come across the right people. Merker, however, indeed also expressly states in the foreword to the first edition that it was not until the fifth year after the beginning of his work that he came across those traditions from ancient times, which by no means commonly cross people's lips, but are handed down only in particular families and there are only ever to be found among a few old men. And then it took another year and a half before Merker had completely learned what is set down in
114 his fourth chapter. Moreover, even according to Hollis (cf. also
776 C. Eliot's introduction to A. C. Hollis, The Masai, their
782 language and folklore, p. xix), the monotheism of the Masai
113

/xxii cont./

773 feature among the Masai, with all the rest, is not so astonishing
171 (1).
174

1. Incidentally, I should like to point out that the name of the old medicine man Lesigiriëschi, Merker, 25, 386, is certainly to be compared with the name i-Sigiriaischi, which the Somali bear among the Masai (Hollis, p. 30).

114 I conclude these considerations with the certain expecta-
773 tion that now, when my deceased friend's book comes out for the second time, the early histories of the Masai will no longer encounter the skepticism to which they were exposed when they first became known, but that they will now be duly appreciated for their as yet incalculable importance to the history of religion, as they deserve to be. And I repeat once more
[174] that a Christian or Jewish influence, perhaps even in early
[177] times (at all events through the Christian Nuba of the third century A.D., or through the Jewish Falascha /Falasha/ on the borders of Abyssinia), from the older northern dwelling-sites of the Masai, is quite out of the question, since one would then, as Merker already emphasized, necessarily have to expect not only connections with the Biblical early and patriarchal histories up to the lawgiving, but also with the later parts of Biblical history (and above all some allusion to the Gospels, if Christian missionaries are to be considered). The previously discussed connections with the Chaldean early histories, and, to be sure, at points not touched on by

D /9 cont./
105 dependency on them. A caravan traveling across the steppes certainly does not remain hidden from the Wandoróbo roaming about everywhere. /10/ Their betrayal soon causes it to fall victim to the spoils-hungry Masai. Through their poverty and the contemptible endeavor to make up for the lack of slaughter animals through
M [829] the killing of game, the Wandoróbo, to be sure, stand especially
[177] low in the estimation of the Masai, yet the latter do not deny the connection with their old fellow tribesmen to the extent that they do not grant individual Wandoróbo, as well as El lumbua and El muli, admission into their community.

M In recent times those Masai who, after the loss of their live-
101 stock, have become detached from the larger community and live
184 in small kraals in relative poverty, still generally reckon them-
177 selves as belonging to the El dorobbo, without, however, counting themselves within one of the three branches -- Asá, El asiti, El gasurek. Often they live together with a few Wakuafi, sometimes one also finds one or several Wandorobo families among them. Their property consists of a few cows and donkeys, a couple of goats and sheep. Since they cannot subsist on these, they also cultivate maize, batatas, etc. here and there and devote themselves to hunting with bow and arrow.

M The influence that the Masai people exerted and still exert
648 on the settled peoples who live on the borders of the steppes dominated by them for centuries is very great. Just as formerly it was the Wandoróbo, now it is the Wakuafi and Masai to whose influence the surrounding peoples must submit. What qualified
M the Masai for this lordly position is their relatively high cultural
[181] level; what made possible their reaching this position, their strict organization and their war-mindedness. This is not the place to analyze why the culture of the Masai is a higher one than that of
000 individual Negroes surrounding them. It should only be pointed out that among almost all of these, in contrast to the former,

/10 cont./

000 superstition and belief in spirits are to be found in the grossest forms, just as all the crimes resulting from these, such as abortion, infanticide, etc., are everyday occurrences. But
648 721 even a people standing culturally higher than the Masai, with their absolutely quite low culture, would never have arrived at a dominant position peacefully living side by side. The means of attaining it were the wars waged constantly and ruthlessly. Their daring raids greatly impressed the Negroes, which
[177] is why the latter, in order to be taken for Masai themselves and to be feared as such, adopted their attire on war expeditions.
144 177 The involuntary admission into these Negro tribes on the part of many Masai women and children, who often fell victim to their neighbors during the constant wars, as well as the compulsory intercourse of those who found help and refuge among the adjacent agriculturalists when the periodically recurring epidemics had carried off their livestock, created circumstances
000 that took shape in the direction of a general Masaization. To the young Negroes the free, lazy existence of the Masai warriors, devoted only to war and raids, seemed worth aspiring to, and the girls found the handsome slender Masai figures more desirable /11/ than the men of their own tribe, who, in their often hideously ugly and wild Negroishness and through the frequently total lack of care of skin and body, stand in coarse contrast to the agreeable, often finely chiseled, and handsome features and the shapely limbs of the former. Thus the Masai
144 177 gave much of their blood to other tribes, and today in almost all the peoples who have come into close contact with them one finds figures which at first glance one could take for pure Masai.

Ill. 1. Masai woman from below Kibongoto.

177 That various customs of theirs and words of their language also found entry among the Negroes follows automatically.

619 While some travelers recognize at least a certain relationship
144 between the three branches, others claim to have observed such
142 great somatic differences between them that one might be doubtful
114 about their racial unity and ask oneself whether the Wadoróbo and the Wakuafi of certain colonies should not be counted among the Negroes. This error is explained by the fact that those travelers have come into contact with them only superficially. /12/ drew conclusions going too far from isolated individuals to the generality, so that they regarded the Wakuafi, strongly mixed with Negroes, as pure, and Negroes strongly mixed with Masai blood as Wakuafi.

714 /82 cont./
531 nowadays the warriors, out of boastfulness, go on using shields,
178 with unaltered escutcheons, taken as booty in battle with Negroes (1)
[721]
• [197]

1. The fact that Negroes also carry shields of the Masai type, and, to be sure, with similar escutcheons, is a consequence of the above-mentioned Masaization.

or half-breeds of Negroes and members or bastards of the Masai people or, with the present discord, even those of other Masai.

714 The shields of the el barnot, the recruits, do not appear as gaily
53 colored (Plate 1: Figs. 1 and 8). As soon as the youths have received
701 the shields, they ask the most esteemed of the married men, a former
561 speaker of the warriors, for his consent that they be permitted to paint a black emblem on the surface of the shield. At the time he gives his permission, he also determines the form of the emblem, that is, he does not invent a new one, but chooses one from among the old familiar ones. With this and with an ornamental band only drawn in

177 181 609 466

As a servant of Europeans the Masai in general shows the same moral quality as the members of other tribes from the interior of East Africa (1).

1. I became acquainted with youths of ten different tribes of the interior. They are all quite considerably better, though also more inept in the beginning, than the brazen-impudent, conceited, and thievish nigger-dandy of the coast.

There is just as little domestic-servant faithfulness and dependability as there is constancy and gratitude for benefits enjoyed. An opportunity to rob the master is happily utilized; in the kitchen, meat, milk, and butter especially disappear. In the pasture the Masai herdsman draws off milk from the cows and blood from the oxen and sucks fat from the tails of sheep. One time the herdsman came home from the pasture in the evening, quite out of breath, and lamented that an elephant coming in the vicinity of the herd had scattered the cattle by its bellowing. In spite of a diligent search, two head of cattle were supposedly lost because of it -- two cows, of course! This was indeed very annoying, but was not to be altered, and I contented myself /118/ with ordering the herdsman to stay closer to the station with the herd. About eight days later the same incident -- ostensibly -- happened, and again it was two of the best cows. If that had gone on, we would have been rid of the entire herd in a few months. The warning had been useless, so the shepard was given a sound thrashing. And behold! From then on not only did the elephants remain away from the herd permanently, but even the cattle that had last disappeared showed up again. He had stolen them and given them to a friend for safe-keeping. Another case. A settler had a herd of fine select livestock about two hours from the farm in a secure palisade-kraal and in the care of a number of Masai in his service. A mark had been scratched into the hide of the cattle. One day the herdsmen brought a number of cows to the farm with the observation that the mark had grown over and would have to be cut again. The owner did

/118 cont./

177 181 609 466 this and discovered to his sorrow that the cows had wasted away in the last few weeks to the point of being unrecognizable. If he had examined them more closely, he would also have found that they had aged several years in the preceding month. But he had no thought of any dishonesty of the people, whom he considered honorable and good, until after more than 100 of his finest cows had been exchanged for old, worthless ones and he had unsuspectingly marked all of the latter. One could cite a whole series of such examples instructive for the settler, but here let there be pointed out only one particularly popular trick: When in the evening the livestock of the settler is driven to water, the native stock-owners -- both Masai and Negroes -- also like to drive their herds into the vicinity of this watering place. In the press and haste of the livestock for the water, there run into the herd of the European, as intended, a few head of the cattle of the Black, who now, instead of taking his stock out of the strange herd again, moves off with a corresponding number of the settler's best cattle.

177 181 464 609 [454] When the Masai servant who regularly invested his savings in cattle has assembled a small herd, he often enough leaves service in order to return again to his people. If an opportunity presents itself, it may happen that he now serves his compatriots as a spy against his former master. Uncircumcised youths who hire themselves out as boys return to their native kraals for circumcision, live there a few years with their contemporaries in the usual manner, and then often go back into service.

177 181 609 829 The Masai living in the tribe is and remains mistrustful of every European whom he has not become intimately acquainted with through the years. He regards the latter's honesty and forbearance as weakness and believes that it is only because of a lack of strength and cleverness that the European does not oppress him just as he himself does this with the Negroes. He performs a service for the European only in order /119/ to have some -- often enough illegal -- benefits from it. If he concludes friendship with him, it is done merely for the sake of appearances and a monentary advantage. As one accused, he almost never confesses, even with guilt proved, but rather, asserts with profound indignation: "A Masai does not do anything like

/119 cont./

177 that" (1).
181
609
829

1. When, after receiving news of an ugly misdemeanor or crime, I spoke to one or another more trustworthy Masai about the unknown culprit, I often heard: It was surely not a Masai. A Masai would not do anything like that. Such things do not happen among the Masai.

Though he may know better, he accuses an ol mēgi just as unhesitatingly as he absolves a fellow tribesman (2).

[564]
[326]

2. It may be mentioned here that, according to my observation, the insincerity and dishonesty of the people belonging to the blacksmith caste are decidedly greater than that of the other Masai, so that it seems as if the contempt and bad treatment that the former experience from the latter have bred an inferiority of character in the course of the millenniums.

829 The mental superiority of the European inpresses him only in such cases where it has convicted him of some villainy, while his technical skills reek far too much of the despised "ol kononi" to the Masai to seem worth notice. It is solely the guns of the Protectorate Troops that obtain for the white man respect and influence among the Masai and have made this master race of East Africa somewhat more modest.

186 The picture becomes more gratifying if one observes the Masai
181 in intercourse with his own kind. Dobirá eń gutok sidai el masai = make a good mouth toward the Masai, that is, be good, friendly, sincere toward your fellow tribesmen.

/120 cont./ If they
181 spare women and children in war, it is not out of compassion, but
[567] solely in order to make them useful as slaves, whereas the Masai do
not keep such. In general one cannot attribute to them a lasting
vindictiveness toward their own kind. The Masai only in part
possesses the courage attributed to him. Their extraordinary impu-
dence often makes them appear more courageous than they really
[593] are. Their sensuality equals that of most East African tribes. The
[837] wife is at the disposal of every man who belongs to the age class
[561] (both ol boror and ol adji) of her husband and desires her. It is
593 obvious that, as a result of such conditions and in conjunction with
the prevailing polygyny, there can be no question of a proper family
life in the higher sense. For her own husband the woman is espe-
cially the labor force that he needs for household and livestock
management and the means of fulfilling his wish for as many progeny
as possible. Accordingly her treatment depends on how she measures
562 up to these tasks. Moderate beatings are not uncommon, but rough
461 treatment almost never occurs. In contrast to the men loafing
[462] about lazily, the women are busy all day long. For the married
[517] women there are scarcely any amusements except dance and song;
they had their share of them before their marriage, when they could
have their fling in the warrior kraal. In public life, as well as with
respect to her own husband, the wife has no rights. Of course the
Masai woman does not regard her servile position as such. She knows
nothing else, and fortunately one does not miss a comfort that one
562 does not know. As soon, however, as she is transplanted from her
461 own tribe into a foreign one through kidnapping in war, her willing-
178 ness to work immediately comes to an end. The less oppressive
• 177 her new position is, the lazier and at the same time more demanding
she becomes. She suddenly regards herself as too good to work, and
her desire for clothing and adornment often increases immeasurably.
/121/ Accordingly, her interest in the household becomes less to the
point of disappearing and her passion for amusement great. The reason
for this phenomenon undoubtedly lies in the fact that she regards life
among the hated and despised el meg as a disgrace and the work re-
quired of her by them as an insult inflicted on her.

/127 cont./

411 polished, seldom unpolished and black. The latter is not a sign of crudeness, but is supposed to prevent gleaming in the sun. The [439] spears carried by the Masai are not all made by the el konono, but are also /128/ bought from sedentary Negroes, and, to be sure, [177] chiefly from the Wadschagga of the Kilimandscharo, whose blacksmiths make them for the warriors of their tribe or also on order for [177] Masai warriors. One therefore finds among the spears of the Masai

142

/128 cont./

411 [171] sometimes alien types, which, however, only in exceptional cases do not closely lean on the general Masai shape. The essential difference between the two types is that the axes of the cross-section (Fig. 28) in /129/ the blade prepared by the Masai smiths stand obliquely to each other; in the one made by the Negroes, at right angles to each other. Another difference appears in the lower end of the blade among the long, narrow forms (Fig. 29), which among the former spears is more heart-shaped (a) or also spoon-shaped (b),

among the others usually more spade-shaped (c). The first two
[177] shapes, especially the spoon-shaped one, have in more recent times also been imitated by Negro smiths, and, to be sure, as I /130/ was able to determine in several cases, on the express
[184] order of Masai warriors. While the spear shoe is circular above
[422] and below as a rule, one also finds such, particularly in the Ol bruggo province, among which these parts have a rectangular diameter and one which notches (Fig. 30) are made as ownership marks of various meanings (1).

1. They may mean: district, ol boror, tribe or lineage, etc., of the owner.

/Figs. 30-32 appear here./

411
482 On the march the spear is carried, either on the right or on the left, in three different ways, among which the warrior alternates according to convenience. 1. With outstretched arm hanging down, the hand grasps the spear shaft at the spear's center of gravity. The spear lies horizontally, the tip /131/ directed forward and slightly outward. 2. The spear is carried in the arm, similar to the position of the "gun in the arm." With thumb, index finger, and middle finger the spear shoe is grasped in the middle, as one

[TEXT CONTINUED ON PAGE 173]

/134 cont./

411 [136] [237] flocks in the branches of the trees surrounding the kraals, waiting for some kind of animal waste. In addition to the iron points, one also finds awl-shaped wooden points; the latter are often poisoned, the former only rarely. The Masai do not make the poison (en [439] duerai) themselves, but buy it from Wandorobo, who obtain it from /135/ the olmoridjoi (Acocanthera abyssinica) tree by boiling the roots and the wood. The arrows are carried in a leather quiver (e modian, modiani), which is slung over the shoulder on a leather [237] strap. It consists of a tube 70 centimeters long and made out of neat's skin, with a bottom stitched in and a similarly worked, twelve-centimeter lid that can be turned up high.

Firearms, which at times almost entirely replaced the spears and bows among sedentary Negroes (1),

1. For example, in a few areas at Kilimandscharo.

[648] [727] are not generally carried by the Masai. Although in the battles with the Protectorate Troops they have at various times captured guns and ammunition from fallen Askari, I never observed or learned that they used these weapons. They never bought muzzle-loaders from trade caravans, and the ones that I found in one of their kraals showed by the lack of cock or piston, or by other damage, that they were not carried along by the Masai for the purpose of use, but merely as trophies. It was not until April, 1902, [177] that a troop of Masai warriors armed with English Snyder breech-loaders came into my field of observation. The troop came from the Masai province of Ol bruggo, and, to be sure, from the English station of Nairobi, located on the Uganda railway, and attempted an invasion in the Kilimandscharo area of Rombo. With a loss of approximately 20 per cent dead and bootyless, however, they were sent home by the Warombo, armed only with spears.

000 Clothing and adornment. -- Cloth materials. -- Leather dressing. -- The individual articles of clothing. -- "Beautifying" the body, head hair, beard, body hair. -- The hair style of the warriors. -- Painting of the face and body. -- Caustic and incised decorative scars. -- Teeth. -- Fingernails.

29 | 179 [439] Cloth materials, such as the caravans from the coast engaged in the ivory trade in the Masai steppes take along trade goods, have not yet ever really succeeded in being adopted among the Masai.

For the trade this is, of course, regrettable, but for one who comes into frequent, daily contact with the people it is really fortunate, for there is scarcely an uglier and more repulsive sight than a native decked out as completely as possible in European clothing, especially if one sees him thus amidst his fellow tribesmen in their traditional garb exactly suitable for them. Not only is the eye offended, however, but also the nose and further many another. One should merely consider that the people have never learned how to manage with such clothing and that generations will pass before its use has to a certain extent become part of their flesh and blood. [296] /136/ A cleansing of the things therefore does not occur and likewise the regular drawing off and on. The native hangs on his body whatever he gets and keeps it on until it falls off by itself, so to speak. [515] [147] Naturally he always stinks and as a rule also harbors all kinds of vermin. One day I met with a European caravan a Masai youth whose former master had departed some six weeks previously and, upon leaving, had given him a pair of shoes. The boy told me quite innocently that he had put the shoes on at the time and had never removed them since! The people of the caravan, European and Colored, confirmed this statement. Such aesthetic aberrations are very rare exceptions among the Masai, however. Every sensible person disdains bedecking himself with such trash, and that boy would also /Ill. 43 appears here/ come to his senses again when the shoes were in shreds. From then on I always saw him only in Masai dress.

/136 cont./

142
302

Ill. 43. Masai woman with needlework.

293 The only European article that one sees now and then, but still
1177 always rarely, is the umbrella, which the Masai use as protection against the sun.

281 Rather treated animal skins still today, occupy few place in
[294] the clothing. The preparation of the skins that are not supposed to have the fur removed (warrior capes and leather to sit on) is a primitive chamois dressing. The skins are stretched out and thoroughly dried. Then they are rubbed several times with butter or fat and soundly beaten each time. Swelling the skins is known as little as is removing the superfluous fat clinging to them at the end of the treatment. The finished leather feels greasy and soft.

/146 cont./

301

Children, as well as young men and women, wear on the fingers as adornment rings (el gimil, el gimu) made out of four or five coils of copper wire, the ends of which, on the outside, often form flat spirals (Fig. 60). The first ring is stuck on the middle finger of the right hand, the second one on that of the left, the next ones on any other finger. It is not a rarity for a woman to wear rings on all her [151] fingers, including the thumbs. Mothers stick on the second toe of the right foot of their babies a /147/ simple ring of copper wire as protective magic against illness, if previously one or two of their children have already died at an early age. Now and then one also finds rings made out of sheet iron, on which the outer part of the circle bears shieldlike appendages above and below (Fig. 61). The [152] Masai call them en sagalgar and maintain that they stem from the Wakikuyu. It is certain that they are not made by the Masai.

302 Boys and married men frequently shave their heads so that the hair is scarcely more than an inch long. Women shave their heads even more often, and, to be sure, either entirely or only a strip all around. For shaving /Figs. 62-63 and Ill. 48 appear here/ they use [512]

/147 cont./

302 Axillary hair /148/ and eyebrows are shaved. Women also shave the pubic hair, whereas men pluck it out with the fingers or tweezers.
302 714 Young warriors let the hair grow and, when it has the necessary length, twist it between two fingers, through which apparently arise little balls, which, on closer inspection, prove to be spirals interlaced and rolled together. Somewhat later it is twisted together
[386] into strands (ol babet, el babet) with red paint, a mixture of animal fat and red earth, which hang entangled around the head. Further-
[177] more they are lengthened by twisting in fibers of the bark of the baobab (ol mĕaĕrĕ) and of another tree called ol retéti, in order to form out of that the braid-coiffure peculiar to the Masai warriors, but adopted by many neighboring tribes (Fig. 64, 65, 66 [ol daiga, el daigan]). For this the hair is parted crosswise over the head from ear to ear, and then that of the front half of the head is divided into three parts, one over the forehead, the other two at the

Ill. 57. Masai sheep.

231 [492] [177] /167/ Where the Masai are neighbors of the Somali (in British East Africa), the camel has also found entry among them as a beast of burden. They do not, however, generally share the passion of their neighbors, for whose palate the meat of these animals is a special delicacy. The Masai do not keep chickens, ducks, pigeons, etc. The attachment of the Masai to their cattle, especially to the cows, makes them seem to them like companions and friends. Thus, their habit of giving their animals names, especially considering the extravagance that the people indulge in with proper names, does not seem at all surprising. The /Ill. 58 appears here/ name Sudjaro means that the cow has come from a distance. Rimogeno was captured in the vicinity . Nondoje is a cow given as bride price. Sotoa is one such that was received as a gift from an uncle or aunt. A cow paid as fine is called Njamu. Each of the five cows that the

233 552

/170 cont./

232 horny scar often five centimeters high, /171/ through which the
233 inoculated animals, which are now supposed to be protected against becoming sick with tuberculosis, are permanently marked. Numerous observations in this direction showed me the justification of this view.
[176] [191] The ol oiboni Mbatyan is regarded as the inventor of the inoculation method.

[136] In some years, and, to be sure, in the rainy season, great multitudes of dark green caterpillars one to one and a half inches long are found in the grasses of the steppe. Cattle that eat the caterpillars are stricken with eng ea el gurt (ol gurto = the caterpillar). As symptoms of the sickness I observed: first a few hoarse coughing sounds, then giddiness, which rapidly mounts and makes the animal stagger as though out of drunkenness; soon it lies down and is brought to a standing position only with difficulty, only to lie down again after a few minutes, whereupon death occurs often after only half
[411] an hour. The treatment consists of bloodletting by an arrow shot (Fig. 76) into the jugular vein, whereby one to one and a half liters of blood is emptied out. Through that recovery is reached after just a few hours, as I observed in over 100 cases (1).

1. The microscopic examination of blood slides (ear, heart, spleen) of sick and dead animals gave a negative finding (Oberarzt /staff physician/ Dr. Grothusen). I observed the appearance of masses of the caterpillars in March, 1898, in the steppe south of Kilimandscharo, in December, 1902, in the steppe southwest of Kilimandscharo, in the entire region between the latter and Lake Manyara, and in April, 1905, in Daressalam /Dar es Salaam/.

[177] In another case, out of four head of cattle, after two had already died of the sickness, the other two, through the infusion of an emetic consisting of a mixture of sugar-cane beer and a tobacco extract, which was given upon the advice of the Wapare in Manamata on the southern end of Lake Jipe, could be cured.

/183 cont./

757 For gonorrhea they use a whole number of medicaments, to some of which they attribute only or chiefly a diuretic effect, to others a healing effect as well. The principal remedies are the following: decoction of the bark of ol jani 'njugi (Embelia kilimandscharica), often mixed with calf urine; furthermore of os sagararam (Bauhinia reticulata), ol debessi (Acacia cfr. verrugia Schwfth.), ol mokotan (Albizzia anthelmintica) and ol gelai (?); a root decoction of the latter is also used, as well as of ol orondo (Cissus sesquipedalis Gilg), ol assassiai (Osyris tenuifolia Engl.), ol dorotua, and, finally, dococtions of the dried root bark of o'remit (Salvadora persica) and of the wood of a Rhus species (ol mesigie kete), which is regarded especially as a diuretic.

[164] /184/ For cystic catarrh one drinks a weak decoction of the root of o'remit (Salvadora persica).

832 A bark decoction of ol dimigómmi (Pappea capensis) is regarded as an aphrodisiac for men, one made out of ol mokotan (Albizzia anthelmintica) for women. The bark of the trees ol giloriti (Acacia [263] abyssinica) and ol okiteni, used as seasoning for meat broth, is supposed to have the opposite effect among the warriors.

These last two remedies, however, are by no means regarded as sedatives, but, on the contrary, as stimulants. The people [147] explain the effect ascribed to them here with the words: the warrior does not like the odor of the girl, by which probably a specific foetor urinae /stink of urine/ more or less clinging to the clothing of all women is to be understood.

Nerve Ailments

757 With headache (eńg ga ol ogunja) a blister is produced on each [164] of the temples and on the nape with the fire twirler (ol biron) rubbed hot; more rarely one ties a cord rather tightly around the forehead and the occiput. The latter remedy is not peculiar to the Masai, [177] but has been adopted in places from other peoples.

[164] For earache (eńg ga ōń gia) one pours warm butter into the ear.

/186 cont./

276 consciousness returns immediately and the attack passes over into a quiet spell of weeping, whereas after a slight wounding inflicted on another, the patient's excitement is said to increase further. If the outbreak of the attack -- which usually occurs toward evening -- is noticed in time by the warriors squatting around the patient, a number of them throw themselves upon him, force him to the ground, and hold him firmly until the attack passes. This occurs, as a rule, after half an hour or an hour, less often it lasts somewhat longer. Then a restless sleep follows, interrupted several times by fits of crying and flow of saliva, until toward morning, when a second, somewhat weaker attack occurs, during which the patient is treated as before. This second attack is often somewhat briefer than the first and turns into a spell of weeping gradually becoming quieter, which as a rule is soon succeeded by general exhaustion, which ends in deep sleep. After this the patient usually goes on to a speedy recovery; more rarely it appears as though still another relapse is to follow, which will be expressed by greater violence of the weeping fits. That there is no third attack is traced back by the people to the fact that the patient was already fettered during the second one, his companions now guard him more carefully and keep away from him any opportunity for excitement -- even a glimpse of weapons. To hasten a cure, large quantities, a liter and more, of liquid fat is poured into the patient, which he usually also gets even in the preceding stage to alleviate the expected attack. The Masai call the attack em boschona, and the one suffering from it ol morani boschinŏti.

As frequent as the severe form of em boschona is -- since every warrior suffers from it several times in the course of his warrior period, and it is rare if one of them remains spared altogether -- the European will nevertheless usually be able to observe only the much more commonly occurring mild form. Here the long pre-stage is entirely absent or is limited to a few hours or even only minutes, during which the patient sits gloomily and weeps. The attack lasts from about a quarter of an hour to half an hour and ends with general exhaustion
276 followed by sleep. It should also be mentioned that among the
171 sedentary Negro tribes who live in close contact with the Masai and
• 177

/186 cont./

276 171 [177] have adopted many of their manners and customs the warriors regard becoming stricken with the em boschona as a sign of true, ferocious warriordom, and they frequently simulate it for this reason. Amidst whooping cries the simulator with spear in hand dashes out of the camp and would surely not inflict an injury on anyone, even if -- as in the /187/ cases observed among the Wadschagga -- a few people did not immediately run after him, seize him, and lead him back.

276 [152] The lack of any control over emotions and inclinations probably also plays a not unimportant role in the occurrence of em boschona. Its cause seems to me, however, to lie entirely in the excessive use of the aforementioned excitants, so that the illness would not occur at all if they were avoided completely or were taken only in a very

276 561 considerably lesser volume. Their harmfulness can be observed almost daily among the warriors in an abnormal state of nervous irritability. This view is based on my observations (with which all the statements on this point made to me by the Masai agree) that only the warriors, that is, the young, strong, healthy men, are stricken with em boschona, while boys and youths, before they enter into the association of the warriors, and even during the first period as such, and furthermore married men, as well as girls and women, remain completely immune to it. These persons, however, either do not take any of the stimulants named at all, or only in very small measure.

276 158 171 In this description of em boschona one is inevitably reminded of the running amok of the Malays. Only the complex of symptoms is similar, however, while the etiology and the prognosis are entirely different. Whereas running amok as a rule ends with the death of the person concerned, em boschona is cured within a few days. Whereas the effect of opium as the original cause of running amok is today no longer regarded as decisive, in every case of em boschona the copious use of those agents only a short time before will be indicated.

/194/

752 [177] There might be described here a successful operation performed by the aforementioned ol abani: In November, 1901, a boy fractured the right tibia quite close to the knee and, soon after the accident, was carried by his friends to a European settlement several hours away. There they asked the European for his help, but he did not dare undertake the treatment and ordered the people to take the patient to the hospital of the military station of Moschi. Now whether the patient or his bearers did not agree with the plan to embark on a two-day journey is beside the point; in any case, the patient, on the following day, was brought to a rather large livestock-kraal to which the aforementioned surgeon, who, incidentally, lived six hours away, was fetched. He found a large, suppurating wound, out of which the lower end of the tibia projected, the marrow of which was likewise suppurating. The ol abani, proceeding from the wound, now cut open the lower leg on the tibia up to a handbreadth above the ankle and peeled out the lower end of the bone equally far. Then he broke this off about ten centimeters above the lower joint, removed the putrefying marrow from the rest of the tibia, cleaned the wound with warm water and by scraping out the upper part of it, and sewed it up with five thorns. Three months later the boy was already able to walk and to resume his work as herdsman.

Of foreign bodies one finds in wounds arrow points most frequently. Taking them out, is certainly more difficult than to take out other foreign bodies, and it will therefore suffice to discuss the method used for this, since those for the removal of more harmless objects will follow from that. First of all, it leads to an operation, of course, only if -- which is seldom the case -- the arrow is not poisoned or if -- which fortunately often occurs -- the poison has become ineffective through decomposition. Since in battle the torso as a rule is protected by shield and beside the leather cape also often deflects the arrow or at any rate greatly diminishes its force, deeper arrow wounds usually occur occur only on the extremities. If the entire arrow remains stuck in the wound, the operator knows immediately, without a lengthy examination, where the point rests and how it lies. If there are only muscles lying in front of the point in the direction of the shot, he quickly pushes the arrow through and draws out point and tang on the other side, the shaft on the shot-entry side. On the other hand, if bones lie in front of the arrow point, this method is automatically eliminated. Simply pulling out the arrow through the shot-entry

XXI.

000 Religion. -- Monotheism. -- Religious doctrine. -- Explanation of natural phenomena. -- Prayers. -- Supplication feasts. -- Sacrifices. -- The snakes. -- Evil spirits. -- Sorcery. -- Amulets. -- Evil eye.

177 771 In a comparison of the ethnography of the Masai with that of the peoples neighboring them, living around them, no chasm as deep as in the field of religious outlook appears anywhere. Whereas in almost all the areas of ethnography we otherwise find a more or less strong influencing of the latter by the former -- from more external things, /204/ such as ornaments and weapons, to more deeply incisive social changes, such as, for example, the shaping of warriordom after the Masai model -- the religion of the two shows a sharp separation, which nowhere permits any interplay of the one in the other. In sharp contrast to the anthropolatry, the worship of departed human spirits, and the polydemonism of the Negroes, occurring in all forms and gradations, stands the simple, straightforward monotheism of the Masai.

776 779 Their god is called 'Ng ai and is an incorporeal being, a spirit. The people do not think about his appearance. The making of pictorial or sculptural representations of God would be a sin, according to his commandment given to the Masai. God is the creator of the world, the earth, and all that it harbors. He governs everything through his will. He is the guardian of the natural and moral order of the world. The laws and commandments that are valid in the life of the people and of the individual are expressions of his will. God is almighty, omnipresent, omniscient, benign, infinite, eternal. [771] 'Ng ai najollo = God knows it, 'Ng ai naischa el duhganak, 'n dogitin sidan = God gives human beings the good things, ol bai 'l Eng ai = it is the will of God, are words that one can hear every day, and they are not often used thoughtlessly, for a deep religiosity is peculiar to the Masai generally. God's benevolence forgives human beings a great deal and for a long time. Yet human beings are too weak and sinful, so that God has to punish from time to time for

/206 cont./

776 moon as masculine, corresponding to their word formation, eng oloń
821 and ol aba. That this view is not peculiar to the Masai, but was
[177] somewhat uncritically adopted by them is evident from the fact that to a question about the reason for it one is given a very childlike reply, if any at all. "The sun has to work all day, the moon only a few hours at night, consequently the overworked sun is probably a woman, corresponding to the earthly performance of work!" Others again have the sun and moon married; sometimes the former is the man, sometimes the woman in this marriage; it is only certain that both travel, one behind the other, toward the west, where the common hut stands in the clouds. Where the tendency toward personification
[177] of natural phenomena is peculiar to a people, one must expect that firm views exist at least about the most important and most frequent ones, and therefore the uncertainty in these explanations also shows that it is a matter of something that the Masai adopted, without having any understanding of them.

The first-born child of 'Ng ai, the girl Barsâi, brings to human beings the greatest benefit, the rain, and thereby shows that God is satisfied with the doings on earth. His eldest son, Ol gurugur, announces through thunder and lightning that God is angry with human beings because of their bad behavior and at the same time admonishes them to improve. A rainbow is the sign that God is satisfied with the doings of the Masai and is therefore well disposed toward them. Wind and storm are the raging of a wrathful God. Hail announces coming
821 rain. A fireball (bolide) shows that now plentiful rain will fall and
787 that the people will be spared misfortunes, such as livestock epidemics and pox. A comet, on the other hand, means misfortune; sickness and death will befall human beings and livestock. Upon the appearance of a very bright comet in the eighties there soon followed the great livestock epidemic, rinderpest and tuberculosis.

821 The Milky Way is the path along which the children of 'Ng ai
776 wander as bright stars. From here they observe the doings of mankind and report on them to God. Other stars are his eyes; now and then one of them shoots forward from there toward the earth, in order to see more accurately -- a shooting star. Venus, which the Masai call en kilegen, announces rain through particularly bright

/227 cont./

539 the kraal for a short time, the foreign woman stuck the two children in a large wooden pot and threw it into the nearby river, which carried it far away. Then, both hands full of cattle blood, she waited in the hut doorway for the mother of the little ones and, when she came home, smeared her face with the blood and ran out screaming, accusing the other one of having devoured her own children. When the people saw the blood on the face of the one accused, they believed the accusation. The man divorced his wife and inflicted on her the punishment that she was to tend his donkeys until her death. Then he married the other woman. Meanwhile the two children had been adopted by a distant tribe. Children who were playing on the bank had seen the pot arrive, caught it, and carried it to their father. There the boys grew up to be warriors. One day a war expedition was undertaken against the Masai and those two were sent ahead as spies. In the vicinity of a Masai kraal they found an old woman who was herding donkeys. Since it is not customary for women to herd, they asked her why she was doing this work. Then she told them the story of her misfortune and the injustice done to her (1).

1. In Hollis, p. 137, the variation: " and made themselves known as her sons." Ed. Hommel.

When the warriors saw the hatred of the woman against the members of her tribe, they disclosed to her their plan and obtained the assistance of the old woman. After they had quickly killed the boys tending the livestock, they took a bell from the neck of a head of cattle and hung it on a donkey. They tied the latter very close to a tree so that it constantly cried out and rang the bell. The Masai in the kraal heard this and assumed that livestock and donkeys were peacefully grazing. In the meantime, /228/ however, the warriors had made away with the herd and had taken the old woman along out of gratitude for her help.

539 177 829 Finally there should be repeated a little story in which a Masai, returning from the Berliner Kolonial-Ausstellung /Berlin Colonial Exposition/ of 1896, told his countryman about a custom observed there. He said: "In Germany little children do not get food from their mothers (as among us), but they are herded there like small livestock. On the street stand tables, and on these lie plates. When

/228 cont./

539 177 829 the herd of children arrives, the children sit down at the tables and eat. When they have finished eating, they are driven on." -- He had seen the pupils of a school, who were being conducted through the exposition.

Proverbs

539 Meti ol duŋgani lemet ol ogunj' enje = There is not a human being who does not have his head. (Many heads, many minds.)

Meti ol duŋgani lemet dobir en dog' enje egeniogo = There is no human being who does not do his business according to his plan.

Ol duŋgani tenejo nedim aidobira = The person who wants to, can do. (Where there is a will, there is a way.)

Ol air torono, ol ari sidai = A bad year, a good year; in the sense of: sunshine follows rain.

Ol duŋgani amīda éaré t em baie kete = A stupid person is beaten with little things. (One gets to a stupid one with trifling means.)

El jeruata kumok me sidan = It is not good to have many friends.

Ol ari sidai kake esodjo ol torono = A good year is followed by a bad one; in the sense of: Pride goeth before a fall.

Ol duŋgani oerta 'n dogi eeta el jeruata kumok, ol duŋgani lemeta 'n dogi meta hanja = A rich person has many friends, a poor person has nothing. (A friend in need is a friend indeed.)

El duŋganak ate minje sidan, enigi jogi njage 'n dogi = Few people are good if we want something (from them).

Toniño 'ń gutuke ol duŋgana' bege, kake torbare ol ogunj' enu = Listen to everyone's advice, but follow your head.

Gulla duŋgana' l enjerna mejollo (ol) adjo hanja, gulla duŋgana' l eeñai ninje ejollo (el) adjo sidan = One's own people know nothing, strange people know fine words. The proverb has the meaning of "No man is a prophet in his own country."

Ol duŋgani oschál ojello aíesége duŋgani ogul t ol osseg l enje = A weak person can conquer a strong person through his intelligence.

Aňas enā 'n dogi, bai-dogi en daa = First this matter, then the food. (Work before pleasure.)

I.

M 184 The Wandorobo of the three branches of the Masai people.

• [177] The customs of the Wakuafi are in general identical with those of the Masai, and where a slight difference appears in one or another of their colonies, it is to be traced back solely to the influence of the M [128] neighboring sedentary Negro tribes. Such deviations are therefore not peculiar to the Masai people as a whole, and a discussion of them M would go beyond the compass of the present study. On the other hand, D it is necessary to go into more detail on the customs and practice of 121 the Wandorobo belonging to the Masai people, who, in their timid D [177] seclusion, have maintained themselves quite without foreign influence (1).

1. With the exception of such by the Tatoga, a tribe anthropologically very close to the Masai people.

and to present the differences shown by a comparison with the customs of the Masai, as well as to substantiate the correspondence in the main points.

M D 101 184 We have seen that members of all three branches of the Masai people fall under this name (2).

M D [128] 2. In what follows nothing will be said about the Wandorobo not belonging to the Masai people, who are seen, mixed with Tatoga and Masai, as remnants of an extinct Semite people -- who embraced the sun cult.

D 101 The Asá stem from the oldest epoch, the El saiti from the middle one, and the El gassurek from the most recent one (3).

3. The other designations with which the Wandorobo of the individual districts name themselves have geographical meaning.

/303 cont./

*121 174 The last possibility, an immigration across the Red Sea, is out of the question for the Masai. Livestock-raising nomads cannot travel in this way with their herds.

I therefore come to the conclusion that the Masai had already moved into Africa long before the period from which we possess Egyptian documents. With this answered; the first question is already for the influence of Babel, whose civilization did not arise until the fourth millennium, could by no means have been so far-reaching then, and, moreover, the shamanism of the Sumerians still prevailed there at that time. But even if one could postulate a later immigration of the Masai into Africa, there is still lacking any reason for the assumption that the Masai had ever been sedentary. This, however, would be the basic condition for the possibility of Babylonian influence. Babel, with its so much higher civilization and its mighty army, would have been able to draw into its orbit a sedentary people of agriculturalists; but it could not have exerted an influence on a nomadic steppe people, either through mental superiority or through force, without previously robbing it of its independence. Loss of independence for such a people, however, means nothing other than decay of the people's stability -- extinction. Also, however, if an influencing by Babylon were conceivable in temporal or local terms, the possibility of such would be most clearly and positively excluded by the content and spirit of the Masai tradition itself.

*121 797 177 174 [115] In order to eliminate the second case, there is first to be substantiated the fact that, as far as we know up to the present time, never and nowhere have Islam, Judaism, /304/ or the Christian missions been able to exert an influence on the Masai people restlessly wandering across the steppes. I must also exclude the possibility that my informants (people 50 years of age and more) could have been influenced on those points in the aforesaid ways, according to my investigations conducted exhaustively along these lines. Moreover, the people assert most emphatically that they learned those accounts from their fathers, who allegedly in turn heard them from their fathers.

/304 cont./

*121 Now the fact that missionaries of whatever faith, as far as we
997 know, have never exerted any influence on the Masai people does
*177 not, to be sure, exclude the possibility of an influence in the
174 aforesaid direction on single individuals who, be some chance, for example, in war as war captives, were separated from their people. That these then returned to their people and were able to report what they had heard there would likewise be conceivable. Be that as it may, however, could some missionary activity among the Masai that has remained unknown to us or the circumstance that persons individually taught by missionaries were anxious to disseminate what they had heard among their fellow tribesmen really have put the Masai in possession of those accounts such as I found among them?
*121 Would it perhaps be possible that Israelitish, Mohammedan, or
*773 Christian dogmatists, none of whom have any tradition older than
997 that of the Hexateuch for those myths, could have disseminated
177 them in the form in which I found them among the Masai, in a
174 form that is much older and more original than that of the Bible and that has much to report that was already forgotten at the time of the drawing up of the Biblical texts in question, or what, through the further development of religion, to which the sedentation of the Israelites gave a mighty impetus, had long been displaced and supplanted by new ones corresponding to the newly achieved cultural level? The differences that separate the myths of the Masai from the Biblical ones will be pointed out in the comparison to follow and will show us that the Masai could not have arrived at those accounts through the intervention of the missionaries, who -- I repeat -- could only have drawn upon the Hexateuch.

Now one could perhaps interpose: is it not possible that missionaries imparted to the Masai these primeval-age reports in their Biblical form, and that the Masai then altered them in accordance with their understanding and their way of thinking? This is to be
*[171] answered: how can one then explain the fact that the Masai arrived at precisely the form that, though no longer contained in the Bible in clear words, is nevertheless still to be recognized from it? I am thinking, for example, of Jahve's /Yahweh's/ struggle with the dragon preceding the creation, further of the assumption of only

/304 cont./

*121 one forbidden tree in paradise, then of the first murder as the cause
*773 for the deluge, of the clearly recognizable separation, at various
*171 points in the Masai tradition, of source material woven together in
797 the Hexateuch, and finally of many other /305/ passages that will
• 179 be pointed out in what follows. Are these all supposed to be coin-
174 cidences? If it were only a question of a single point one could perhaps provisionally, for want of a better explanation, accept the assumption of a coincidence. But then one can not go on doing that forever when the correspondences pile up to such an extent. This also applies in linguistic respects, for the similarity of sounds in the personal names of both series of myths and for the meaning of names for which the Bible gives no explanation and which the Masai tradition interprets in a sense contained in the corresponding Biblical account, such as, for example, the names Naraba and Eramram.

Further, however, it is also to be considered that the primeval-age tradition that I found among the Masai and for which the Bible contains parallel passages concludes with the epoch of the law-giving. This fact gives further important proof of the impossibility that it could have been foreign dogmatists who brought the Masai those myths. Though in and of itself it is conceivable that Israelitish religious messengers might have made a particular impression on those accounts from antiquity, it is nevertheless most improbable that they would have limited their teaching solely to these and would not also have spoken of Jahve's action in later times. Christian or Mohammedan missionaries, however, would not make the material in question the most important and only subject of their teaching activity at all, but would fashion it for a dissemination the essential teachings of Christ or Mohammed.

*121 There remains only the third possibility, namely, that the
*773 presentations of the Masai, the Israelites, and the Babylonians (1)
*171
174

1. The question as to which population stratum is involved here is to be left open.

/347 cont./

182 caused the Masai people in the period before the occupation of the
731 country by Europeans, I have no reliable observations made by myself
233 or by Europeans. Such can scarcely exist, for at that time the Masai were a feared power that every caravan liked to avoid. I am therefore relying on the statements of old men. According to their recollection, the epidemics were never capable of producing actual famine. As soon as the beginning of an epidemic was observed, the Masai fled in wild flight with the herds, leaving the sick animals lying along the way. Half the herd at most is supposed to have succumbed. If one considers the size of the herds at that time, one understands that the surviving part could always still furnish sufficient milk and meat.
[721] Furthermore, the war expeditions soon brought substitutes for the fallen animals and thus acted to preserve prosperity (2).

2. It is to be inserted here that empirically livestock epidemics caused few losses for the sedentary Negro practicing animal husbandry along with agriculture. This is probably chiefly due to the fact that he calls only very few head his own and keeps these in his hut, which is far from the next one. Through that the Masai were able to replenish their depleted herds quickly and easily.

182 Finally, the Masai's profound contempt for the surrounding Negro
186 tribes was also favorable for the preservation of the people. It kept the people free of foreign elements, which here would only have resulted in a degeneration of the race.

121 The fable that primitive peoples would have continued to develop
177 peacefully and favorably if Europeans, with their corruption, had not disturbingly interfered has long been recognized as such. On the other hand, however, it remains an /348/ undeniable fact that these peoples decline upon contact with the higher culture, and that many even disappear as a people. The reason for this phenomenon lies in the fact that these peoples have already been living on an unhealthy basis and have owed their preservation to means that we designate as

/348 cont./

121 illegal and immoral, because they run contrary to our consciousness
177 of justice and our Christian morality, and which cause to arise in the economic field exploitation in the crassest sense of the word. Now while every state that occupies a savage country has the duty to appear as promoter and guardian of justice and morality and at the same time to promote economic development by guiding production along the paths of our modern principles, along with that it only too often overturns the foundation pillars on which the existence of a primitive people rests.

182 Thus in plague-ridden Africa the Masai largely owe their existence
721 as a nomadic people, whose only resource lies in its livestock holdings,
178 to the fact that they can always replace their losses by expeditions of war and plunder. As soon as the possibility of such expeditions is taken
[648] away from them, or at least very much reduced, through the erection of military stations that grant protection to the victims of the Masai, there must naturally arise a situation in which a gradually increasing weakening of the vitality of a people takes place. What was formerly to their advantage, their war lust and the cowardice of the Negroes, now becomes fatal for them. Both entice them to raiding expeditions
[361] again and again. In order to avoid the punishment deserved for that, they retreat into regions that they formerly avoided as harmful to the health for human beings and livestock, or on account of inferior
177 pastures. If the Masai, when they came under the influence of the
182 European occupation, had still been the strong people of Mbatyan of 30 years ago, they might perhaps, after the example of other primitive peoples, have carried from it even though a marked, nevertheless only a temporary weakening in the meeting with the higher culture, and then gradually recovered again when they had become ready for
182 its advantages. But we found the Masai already in a condition that
731 looked very much like ruin. The livestock epidemics around the year 1890, which, not locally restricted, had afflicted the herds of all the Masai to such an extent that actually only miserable remnants were left, had produced a general and extraordinarily sever famine. Hundreds of thousands of Masai, especially men and boys, fell victim to it, and in the year 1895 the author still found the steppes around Kilimandscharo appearing in places as though they

/350 cont./

178 its effect. Hated as faithless and despised as agriculturalists, the
619 sedentary ones are constantly plagued by raids that not only cause
72 them great loss in human lives, but also take away any possibility
[829] for them to arrive at any improvement in their way of life by keeping
livestock for the attainment of the meat and milk diet so necessary
[179] for them. Moreover, the frequent intercourse with sedentary Negroes
[164] and caravan people leads to an increase in the cases of venereal
582 diseases. Premature marriages of girls, which can not happen among
178 the Masai still living as nomads, is not rare among the sedentary
184 ones and often enough leads to the death of the young woman who
165 is scarcely more than a child and whose bony structure, despite her
attained capability to conceive, is not yet developed. Finally, it
178 must still be mentioned that no doubt the longing for the formerly
182 free life in the broad steppes and the feeling of humiliation over
having become a so deeply despised cultivator of the soil oneself
are factors that have a wasting effect. The latter circumstance also
[186] brings with it a decrease of national pride. The barrier that kept
[179] Negroes out of the community of the Masai has fallen. A disadvan-
[144] tageous race mixture hurting the people is slowly taking place.
Among the Wakuafi this process was more rapid in their period. At
[648] that time no European administration prevented their raiding exped-
[721] itions in Negro regions, from which they brought home livestock
and women experienced in agriculture.

179 In frequent -- almost daily -- intercourse that soon springs up
178 and then continues to exist between the Masai who have become
sedentary and the settled Negroes, the Masai naturally also share
in the disadvantages that /351/ come to the Negroes through the
encounter of their lower culture with our higher one.

178 We have seen how many difficulties sedentation brings to the
179 Masai, and it is therefore not surprising that a part of those who
361 have already become sedentary give up their fixed residences again
after repeated failures. These then often join the Wandorobo, to
live by hunting, and call themselves this.

18: Merker--476 G-5 (1895-ca.1908) 1910 FL12 Masai FL12

/351 cont./

177
648

The existence of the Masai people was based on a sovereign power shattering or destroying the Negro tribes, which, through constant, successful war and raiding expeditions, not only again and again furnished the necessary cattle herds, but also fostered national unity. The European administration interfered here and through that hastened, in the manner described above, the ruin of a people clinging with extreme tenacity to its old habits of life.

000

The process of becoming sedentary, the transition from livestock nomads to stock-raising agriculturalists will presumably slowly continue to take place, but amidst enormous sacrifices in human lives and the destruction of the people's continuance. A small part -- the ones now richest in livestock -- will perhaps go on maintaining themselves as nomads, or -- the poorest -- will, by the detour of agriculture, again become that and, in enforced peacefulness, graze their small herds. But they, too, will then have ceased to be Masai, for a Masai with shepherd's staff and pipe is no longer a Masai. In view of such an outlook for the future, one is almost struck with melancholy when one hears how firmly the Masai believe in a resurrection of their power, according to the prophecies of Mbatyan, who shortly before his death said "Epidemics will destroy the herds, and civil wars between the parties of Lenana and Zendeo will thin the ranks of the warriors. Then a white bird will come from the coast, nest in our land, and bring us to the edge of destruction. But after this time of trial the Masai people will expand to a new flowering and their old power."

[4] before -- the Masai tribe occupied what is now Western Masailand by conquering and evicting the previous [175] residents (Grant, 1957). The Masai were a fierce and warlike people. Once they had taken over that country no one seriously disputed it with them.

175 648 In the early 1900's through the Government of Kenya the Masai made a treaty directly with the Queen of England. This involved re-settling a segment of the Kenya Masai, but the long term effect was to put the Kenya Masai in a privileged position relative to the other tribes -- who did not have such a treaty -- and to give them a degree of autonomy virtually unknown in other parts of Kenya. Because of their remote location and the nature of the Tanganyika Administration, the Masai in the Tanganyika portion of Western Masailand also maintained [177] a large degree of autonomy. Aided by these circumstances, [178] the extremely conservative western Masai have kept largely to themselves, and to an extraordinary degree the modern world has gone on around them, instead of over them and through their country.

121 *122 *[179] My first visit to the Serengeti-Mara Region was in 1956. I had been assigned to carry out a brief ecological reconnaissance of the Serengeti National Park under the sponsorship of the Wildlife Management Institute and the American Committee for International Wild Life Protection (Talbot, 1956).

175 - 177 The people whom the Masai displaced in Tanganyika were mostly pastoralists. There were also some small tribes who practiced irrigated cultivation near the Rift wall and on some mountain flanks. Those who immediately preceeded the present Masai may have been related to them, and they, in turn, evicted prior residents. Some of these early people dug wells and built dams, but Peshrooke (1948) believes that except for irrigation systems on some mountains, these waterworks were for pastoralism rather than agriculture. There were also isolated tribes of metal workers in the south who may have provided the Masai with spears and knives.

175 [131] 175 648 In the study area, the Masai occupation of the Ngorongoro Highlands and the Serengeti Plain was probably completed by 1850. A people called the Il Datwa occupied the highlands and much of the rest of the area, both north and south of Ngorongoro. These were probably both pastoralists and cultivators. Another similar tribe, the Sonjo, lived near the foot of the Rift near Lake Natron.

Somewhere between 1836 and 1851 the Masai drove the Il Datwa off of the Crater Highlands and the Serengeti Plain. The limestone walls of the eastern

*233 [231] Their[i] livestock, described below, consist of herds of cattle, sheep, goats and donkeys. The Masai way of life revolves around the grazing and water requirements of their livestock.

621 561 614 177 178 Their principal units of social organization, as they affect this discussion, are sections, age grades, villages, and families. Clans have an important place in ethnological discussions and in some areas they determine matters such as water rights (Fosbrooke, 1948). Our impression is that throughout most of Western Masailand the concept of clans is of more ethnolegical than ecological interest. One basic reason for this is the effect of the Government administration in Western Masailand.

With the physical and social upheavels in both Kenya and Tanganyika from the 1880's through about 1920, the establishment of African District Councils (District-wide governing bodies), creation of the park and conservation unit, and various development projects, the clan and other social units have been greatly disrupted. Grant (1954, 1957) describes this effect in some detail for the Masai in the former boundaries of the Serengeti National Park.

[i] [i.e., the Masai.--Analyst]

561 class name, and is allied with the next (or previous)
701 group, the first being the right hand grade and the other
(881) being the left hand grade. After several years the
(884) junior warriors go through another ceremony and become
full warriors. Their total period of warrior duty may
714 be about 15 years. The warriors are distinguished by
their hair style and spear.

714 The hair style involves a complicated
302 plating of the hair with some combination of cords,
pieces of hide or gut, bark, or sticks; all liberally
plastered with sheep or cow fat and red ochre. Elliott
(1948) has detailed the methods and materials used and
variations in style between areas.

714 The warriors' spear is often over five feet
411 long. It has a long,narrow,double-edged blade, an
equally long but round and pointed tail, and between
them a very short wooden hand grip serving as a shaft.
Warriors also carry a flat, double-bladed long knife or
short sword called a simi. These useful weapons are
177 carried at the waist in a red leather sheath. Originally
44 the metal weapons were produced by metal-working tribes.
326 They now come from England and the first thing a moran
does after buying a spear or simi is to file off the
44 brand name. When in ceremonial dress or at war the

41 warriors also carry a narrow oval shield made of buffalo or giraffe hide on a wooden frame, and painted with insignia including the warrior's age grade and clan.

561 701 Originally during the period of warriorhood the morani were not expected to do any work except [712] fight. They lived in a separate village, called a [562] manyatta, and were generally taken care of by the [836] unmarried girls of the tribe. Discipline was reputed to have been extremely good. The warriors had older advisors whom they obeyed.

224 Ostrich's were hunted to obtain feathers [223] for ornaments, buffalo and giraffe for shields, and lion [301] for the highly prized mane. Traditionally the moran [411] was expected to blood his spear on a lion. The dramatic • 177 Masai lion hunts are famous. (Simon, 1962). At 178 present warfare and lion hunting are illegal. The obvious 561 result is a large body of young men with absolutely 701 nothing to do for a period of up to 15 years of what 224 could be the most energetic period of their lives. 721 * [233] They tend the livestock some, but much of the time there is nothing for them to do. As a consequence discipline is breaking down. The elders apparently have much less influence or control over the morani than they did

177 178 224 561 701 721 previously. There is a considerable amount of raiding to steal stock from surrounding tribes. This precipitated several minor wars when we were there, and administrative action prevented one major war with thousands of combatants. Some lions are still killed, and the morani have been blooding their spears on a variety of other animals, most notably rhinos.

561 Following the period of service as warriors, each age class goes through another ceremony. Two age classes, a right hand and left hand together, take the ceremony and they then receive another age grade name which they retain the rest of their lives. Thus these elder age grades each span a period of about 15 years (Grant, 1957).

177 178 561 Periodically the administration has tried to discourage the moran system. In late years some of the elders have also tried to change the system in order to maintain better control over the young men. The system still continues in Western Masailand but it is much less regular than previously.

561 593 591 When a warrior becomes circumcised he may take his mother with him to the warrior' manyatta, or he may leave her home or apparently even stay home himself.

362 started in and under the dung it is similar to a peat fire and virtually impossible to put out.

708 Masai also sometimes abandon a boma, or at least the house involved, if a person dies in it.

751 People who are very seriously ill are removed from the boma at least during the day, often to a small thorn boma with a shelter constructed nearby. They may remain there at night also. It was difficult to learn much definite about this practice. A disabled person spending the night outside a boma is very likely to end up [177] inside a hyaena. The administration frowns on this [178] efficient method of disposal and consequently the Masai have become reticent to talk about it. The sick persons' bomas that we saw looked to have been occupied nights as well as days.

262 Food: Traditionally the Masai are supposed to survive entirely on blood and milk (Gunther, 1955). In Western Masailand the Masai diet consists of posho (maize meal), milk, meat, and occasionally blood. The 234 462 cows and sometimes goats are milked by the women and little 234 girls. The milk is collected in large calabashes. These 415 calabashes, ochre colored and sometimes ornately [531] [386] decorated with beads, are almost as much a symbol of the [291] Masai as the ochre blankets or cloaks, moran spears and hair styles.

... ticks, tsetse fly, and disease.

*233 372 152 Burning grassland appears to be a deeply ingrained cultural trait. Young herdboys will seek out and ignite small patches of unburned grass, sometimes only one or two feet across. We have watched Masai moran striding across a dry plain lighting matches as they went, leaving a long line of small blazes gradually joining together behind them. We have watched junior and senior elders lighting fires, as well as boys and moran. We had marked plots that were burned as much as four times in one year. So we would add to the above explicit reasons for burning, the implied reason that they also burn simply because they get some satisfaction out of it.

182 372 [171] Fires are lit with matches. Possibly some are started from cooking fires that get away. Some fires, especially in wooded areas, are started by Wanderobo honey hunters (see below). But virtually all the fires whose origins we investigated were lit by Masai.

• 177 372 182 It seems probable that the coming of Europeans has altered the fire regime by providing large supplies of matches. It is far easier to light fires with matches than by using flint or other primitive means. With fires

182 easier to light more fires are lit, just as in the case
* 177 of hunting tribes who have received firearms; with game
372 easier to kill, more game is killed. Control in these
(182) matters appears to be enforced by availability of tools and difficulty of accomplishment, not by any conservation ethic.

132 We questioned Masai, other Africans, and Europeans about lightning fires and never found the slightest evidence of lightning causing fires in the savanna country. There is no doubt that it ignites some fires in rim-rock or mountain areas, but we never even saw a lightning-struck tree in the study area. All the lightning we observed in storms was high, it occurred in heavy rain storms, or it was low in the region of Lake Victoria.

182
232 There does not seem to be any discipline or
824 organization to the burning by the Masai. Fires are
*233 started in dry grass when herds leave an area, but they are also lit when herds arrive in an area, if the grass is dry enough. They are even lit in pauses during rain storms.

The forest country on the hills is also burned at

Veterinary Services 1918-1962

648
654
177
232

From the end of the 1914-18 war to the present the Departments of Veterinary Services in both Kenya and Tanganyika have been very active in Masailand. The visible results of their work involve provision of water supplies, treatment and prevention of disease, and provision of some experimental or demonstration ranches whose aim is to encourage better livestock management on the part of the Masai. European veterinary personnel with African assistants have been active in Western Masailand in both Kenya and Tanganyika, and they have exerted a very significant influence on the ecology of the area. As noted above their work has greatly aided the increase in the numbers of the Masai livestock, without showing any demonstrable improvement in the quality of the livestock, and with very demonstrable deterioration of the grazing land, especially in the vicinity of the water points.

The significant exceptions are the activities of the Tsetse Survey and Control Branch of the Kenya Department of Veterinary Services. In Narok District they have maintained two small field houses (one has since been removed), a field laboratory, and an experimental ranch. Their research has been aimed at learning the

19: Talbot E-4,5 (1956-1962)1964 FL12 Masai FL12

648 ecology of the tsetse flies in order to effect their
654
• 177 control without employing destructive game killing or
232 land clearing schemes (Langridge, 1960, 1961). Within Western Masailand their work has largely consisted of careful research and controlled experimentation.

The damage to rangeland resulting from the activities of the other branches of the Veterinary Services are the natural result of a well intentioned, efficient, but narrow approach to the livestock problems of the Masai. Such effects are not limited to East Africa. There are many such examples in the western United States.

*13

311

MAN'S ROLE IN THE GRASSLAND ECOSYSTEM

The Masai are not now and probably never have been in a real equilibrium with their environment. Their history as we know it can be interpreted as roughly parallel to a part of the Americans' exploitation of the United States; exploiting a bit of land and then moving on west until there was no more land to the west.

[178] The exploitation of land by the Masai was a
[177] very long term process until the advent of the Europeans. The combination of peaceful administration, veterinary services, and matches have greatly accelerated the rate of exploitation, but they do not appear to have altered the basic processes. The only difference is that this time the Masai have no more land to the west.

It would be interesting to know if this basic lack of equilibrium with the environment was common to other pastoral tribes in Africa and especially those who preceeded the Masai.

As described and discussed above, the grassland ecosystem in Western Masailand, including its wild fauna, is maintained -- and created -- by a combination of

CHAPTER 10

Masai Herds and Mara Lions

I

THE Masai have won respect by their contempt for civilization and all that it has offered them. For half a century Europeans have been tempting them with all the material bribes, indeed even non-material ones, for which every Bantu and Nilotic people is avid. There is scarcely an African of the fat lands who would not sell his soul for a school certificate. The Masai have rejected school certificates with a proud and lofty disdain.

Will a certificate fatten a bullock or swell the belly of a cow? Masai hearts are with their cattle; they desire no finer destiny for a son than to walk in the dust of a larger herd than his father's. The young man who dreams of glory sees fine white bulls and brindled cows and green grass knee-high, he does not see the stone bungalow, the shining motor-car, the well-cut suit, the framed diploma so alluring to his darker fellow-countrymen. He likes to wear his hair in matted pigtails smeared with red ochre and rancid butter, to stand with one foot against the other knee, to eat a compound of bullock's blood and curdled milk, to carry his long spear and to keep his women in their beads and coils and fly-infested mud burrow as his ancestors did—those ancestors whose lion head-dresses and painted shields filled the hearts of lesser breeds with terror, and won the right of conquest over the steppes of eastern Africa from their northern Somali deserts to their southern tsetse bush.

For the Masai have pride, and pride is a quality we recoil from in ourselves and half-admire, half-deplore in others. An Englishman today must stamp with the hob-nail boots of equality upon the little shoots of pride that cannot help but spring up in his heart; but when he sees the fine, free growth of it in others, an envious respect attacks him. For

21:Huxley Q, T-5 (no date) 1960 FL11 Luo
Masai FL12

MASAI HERDS AND MARA LIONS

For 179 648

Westerners the Masai have become the symbol of a vanished aristocracy, a lost cause they can afford to keep as a household pet who has the spunk to stand up to its master.

The Masai way of life is certainly doomed. For a while it may continue, but nothing in the end can resist the pressures of Western materialism. The British have protected it by freezing a tribal pattern of land ownership, enshrined in a treaty to which the Masai hold with all the desperation of a man clinging to a raft when the waters are rising. That treaty, which confirms them in possession of their grazing-grounds 'for ever', was made to keep out Europeans. Now it is no longer white settlers who threaten them, but black ones. Will a treaty made for the one purpose serve for the other? Only while the British enforce it; when politicians of the land-hungry Kikuyu and Luo peoples occupy the seats of power in Nairobi, the borders of Masailand seem unlikely to remain intact.

For here lie the last reserves of fertile, well-watered and unused land in Kenya, hitherto protected by the strongest guardian of the land in Africa: the tsetse fly. In the last ten years, modern techniques of mastering tsetse-borne diseases, and the tsetse fly itself, have reached a point where all this land could be thrown open to settlement. The question now is partly one of expense, and partly of politics. The Masai themselves do not cultivate. So long as their treaty with the British Government holds good, they will resist to the last man the opening of their land to settlement by the cultivating tribes. 311 648 [136]

II

The Tanganyika–Kenya border cuts through the Masai's territory, most of which is open, semi-arid grassland useless for any purpose other than seasonal grazing by scrub cattle, even if water could be tapped by boreholes. But in the west, where Masailand approaches Lake Victoria, and on the Mau escarpment's south-western slopes, soil and rainfall would support a sizeable population of cultivators. 133

The Masai, numbering about 85,000, keep about one 000

21:Huxley Q, T-5 (no date) 1960 FL11 Luo
Masai FL12

233 The Masai, numbering about 85,000, keep about one
177 million head of scrub cattle, and 660,000 sheep and goats.
556 They *could* export fat steers and lambs, but have done next to
[161] nothing to improve the quality of their animals. This is because they do not need the cash. There are old men living in mud hovels with little but ear-rings, a spear and a blanket who could at any minute realize several thousand pounds for their cattle. Scarcely one of them could not afford a motor-car if he wanted one, probably a Jaguar at that. The plain fact is they do not want motor-cars, or beds, or kitchen sinks, or radios, or refrigerators, or washing machines: they just want cattle, which they have, and which the processes of nature will increase for them without their having to do any disagreeable work.

It is an *impasse*. The whole machinery of modern society, modern trade, modern development, has been halted by the Masai's refusal to keep up with the Jones's, or the Kamaus in this case. It is like a great Britannia aircraft grounded by a midge in the works. Modern civilization runs on avarice as cars on petrol, and if there is no pump where you can fill up with avarice, you simply stay where you are.

But even the Masai are not really free of avarice: it merely takes a different form. If they do not want bicycles and trousers, they do want more cattle, and this has led them into a great error. Instead of rejecting everything the West offered them, they accepted the hypodermic syringe of the vets. First of all the vets put an end to rinderpest, and then, rather less successfully, dealt with various other diseases that were keeping their herds in check.

233 No doubt it would have needed superhuman self-denial on
177 the part of the Masai to have rejected this magical means of
185 ending the periodic epidemics that had wiped out all but a rump of their cherished herds. Yet these were the means by which nature had kept herds and habitat in balance. Vegetation, controlled by constant factors like rainfall and soil structure, cannot multiply as creatures of the animal kingdom can, and do. The fact remains that to accept the vet's syringe was fatal to the Masai, and to offer it to them, as the Government did, without also insisting upon some means of keeping down the livestock population, was an act of remarkable

21:Huxley Q, T-5 (no date) 1960 FL11 Luo
Masai FL12

imbecility—or perhaps not remarkable, since nothing has been more characteristic of the half-century of European intervention in Africa than the slap-happy introduction of bright, well-meaning ideas by enthusiasts of all kinds, without any regard for their long-term consequences.

Anyway, vets controlled diseases, livestock multiplied and their hoofs and mouths destroyed the precarious grass cover of the plains. The result is that, except where the tsetse fly remains in control, the Masai are living in country poised upon the edge of deserthood. Some of it has gone over the edge, some hovers on the borderline, some has not reached it yet. And so pressure mounts upon those regions that are still protected by the tsetse fly.

Overcrowded people outside want to get in, overstocked Masai themselves want to take their herds where grazing is still rich and deep. If either succeed, unless they adopt very different methods, they will destroy those regions as surely as they have damaged their present inheritance. Agricolas and vets do not want to see these last remaining areas opened up without strict control. But governments are terrified of controlling anyone by what may be represented as harsh measures, and administrators have inclined to caution since the Masai speared to death a D.C. who was persuading them to sell some steers. So the matter, like many others, rests in a state of suspended flux, and everyone hopes for good rains.

III

Down on the Kenya–Tanganyika border, not so very long ago, there lived an Englishman who kept in touch with the world by carrier-pigeon. For three or four months of the year no vehicle could reach him, and even in the dry weather it was a long, hard, bumpy seventy-mile journey from Narok, where the road ends. The aeroplane has changed all that. An hour's pleasant flight from Nairobi brought us comfortably to rest beside a tributary of the Mara river.

First we flew over the Mau, that range of mountains forming the south-western wall of the Rift Valley. Covered with forests of cedars and olives and, higher up, of bamboos, the

21:Huxley Q, T-5 (no date) 1960 FL11 Luo
Masai FL12
Kenya FL1

cattle. The Kikuyu and Kamba have brought in the habit of eating ground maize. And so when a man of some other tribe asks a Masai elder if he may cultivate a patch of land, and offers in return to supply maize, the elder will often agree. The cultivator will clear his patch and grow a crop; next season, he will ask permission to bring his wife and family; soon his cooking-stones, his household goods, his thatched hut are installed; he is there, probably for ever. His daughters may grow up to marry Masai men. That is the way the Masai doom will overtake them—as a people, as a warrior race.

M 177 563

Some of these acceptees, used to the cold, are creeping up into the Mau, burning the trees to make their *shambas* as they have done before in other places. Their actions are illegal, but there is no one to enforce the law and no one dares to do so. This country the Masai know to be theirs. If they agree to let people cultivate in the forest, who is the Government to gainsay them? Attempts to remove intruders might well be met by force, and that is a thing no Government dares to contemplate. It was an attempt to use force, after all, for the ultimate good of the people, that led to the Hola disaster. If the tenant were to be hurt, and the Masai to be angered, and a fracas to arise, denunciations of colonialist oppression and tyranny would thunder from the benches of the House of Commons and repercuss all through the Secretariat. So the Mau forests burn.

M 648 311 563

IV

From our camp on the Talek, a tributary of the Mara, Dr. Philip Glover showed us a little of a tsetse research project which combines the excitement of scientific discovery with that of tracking in the old-fashioned, footprint-in-the-sand way. A tough, enthusiastic and handsome young man called Jungle Smith, helped by several veterinary scouts, has cut traces in the bush to make a grid three miles square. Each trace has been cleared of vegetation so as to leave a path receptive to the footprints of animals.

K 654

Each morning, scouts patrol the grids with notebooks in which they enter every spoor they see. By about eleven o'clock

K 654 136

21:Huxley Q, T-5 (no date) 1960 FL11 Luo
Kenya FL1
Masai FL12

K
654

marked with luminous paint to trace their movements; all over East Africa, people bicycled about the bush with sacks on their backs to attract them and grew to pensionable age catching them in nets, digging their pupae out of the sand, keeping them in test-tubes and cages, even studying micro-organisms which appeared to be their enemies.

Seldom has so much careful, detailed, expert study been given to one kind of insect. Some of the many facts discovered have been used ingeniously. Tsetse flies, for instance, probably mate only once in their lives. A current experiment is to expose a number of pupae to controlled doses of radiation which sterilizes them, and then to release the males so that gradually the fly population will die out.

The expense of bush-clearing is its principal handicap, and the quick regeneration of the bush. By itself, it could never have conquered tsetse fly in Africa. In recent years, chemists have discovered how to synthesize drugs which kill the trypanosomes in the blood, and which will prevent infection. The main drug in use at present, Antrycide pro-salt, will protect cattle for about four months.

No one doubts that, in time, the chemists will improve on this, and cattle-owners like the Masai will be able to take their herds anywhere they please. The battle is not yet wholly won; trypanosomes have already shown a tendency to develop resistance to the drugs, and there will no doubt be disappointments and setbacks. But, by and large, it can only be a matter of time before areas like the Mara are opened to hungry herds from overstocked pastures elsewhere.

Several experiments are under way to discover how things could be managed so as to avoid disaster to the land, and at the same time make a profit for its custodians. One such is the Ol Choro Oirowa ranch which the vets are running on behalf of the District Council at Narok. On some 21,000 acres young beasts were to be fattened and sold at a profit, but profits have been shy because of various setbacks, such as an outbreak of pleuro-pneumonia and an army worm invasion. Now it seems that the acreage is too small and the Masai have so far refused to enlarge it. So the vets have not yet succeeded in bringing home to the Masai cattle-owner the basic fact that

M
177
233
K
654

21:Huxley Q, T-5 (no date) 1960 FL11 Luo
Kenya FL1
Masai FL12

good management on modern ranching lines will bring him in hard cash.

I saw the ranch mainly from the air. Lines of bush, cleared by bulldozers dragging giant chains between them, lie neatly along the contour like windrows in a hayfield. Soon the six or seven thousand acres that have been cleared will be fenced, and so managed that star-grass will cover them and steers fatten twice as quickly as they normally do. The snag, of course, is the Masai indifference towards cash.

Yet even here the seeds of change begin to germinate. There are schools now in all Masai centres, Masai students at Makerere, the start of a trickle of Masai teachers, doctors, administrators, vets. One has a Cambridge degree in geography, one is a Legislative Councillor. The shell of Masai indifference has been pricked.

The puncture so far is tiny, but time will enlarge it and one day, not so far away either, the whole shell may crack. Already a Masai parson, the Rev. Daudi Mokinyo, has fenced off 2,000 acres of communal grazing where he fattens steers bred from improved bulls, has a simple milking bail and makes ghee. Elsewhere, half a dozen other Masai have fenced in grazing land. When the railway took a pipeline off Mt. Kilimanjaro, they set up watering points for Masai cattle along its course, and in return one section of the tribe, the Il Kisongo, agreed to operate a pasture-management plan, financed by a grazing fee, which is acting as an entry-point for new ideas.

When these movements spread, as they seem bound to do, the doom of the game will be accomplished. For game cannot co-exist with modern pasture management. Unless the Masai come to see game as an asset of high value, it will go here, as it has on European farms, and for the same reasons: it will go down before the fence, the improved pasture and the need to keep the land free of disease.

VI

To admire pictures in the National Gallery, cathedrals of the Middle Ages or the antiquities of Greece is considered

Then, if it is desired to ask the news of the country from whence the people come, they are asked: 'Do you bring good tidings?' or 'Do you relate good news?' 596

They reply: 'Only the things which are good,' or simply, 'Good news only.'

When Masai warriors meet old men, the latter start the greetings. If there are many warriors, the old men call to them and say: 'Friends.'

To this the warriors reply: 'Yes.'

The elders then say: 'Enkentpai.'

And the warriors answer all together: 'Ilepa.'

When warriors come from a distant country and see some elders outside a kraal, they go up to them, and take their hands, at the same time throwing their spears into the earth. The elders then say to them: 'Greeting.'

When they have dropped one another's hands, the elders say to the warriors: 'Friends,' and the warriors answer: 'Yes.' The elders then give the usual salutation: 'Enkentpai,' to which the warriors reply all together: 'Ilepa.'

Nowadays, however, the warriors do not wait to be greeted by the elders, and call out 'Enkentpai, O je kilunk!' At any rate the so-called El-burgon Masai do this. When the warriors of the Kiongo Masai greet the elders first, they say: 'Enkentpai, O elders!' or 'Enkentpai, O old people!' [illegible]

Marriage[1].

When a Masai wishes to marry, he commences his courtship by making love to a girl while she is still young, and by presenting some tobacco to her father.

He then waits until the girl grows up, when he again offers presents of honey and tobacco.

More honey is given to the father at his daughter's circumcision.

On the young woman's recovery the man proceeds to his future father-in-law's kraal, and takes with him the dowry, viz. three heifers and two bullocks, one of the latter being said to keep the heifers company, whilst the other is slaughtered at the door of the hut. His sister also takes a pot of honey and accompanies him.

The bullock which accompanies the heifers is given to the bride's father in order that the two men may call one another Pakitang, i.e. the giver and receiver of a bullock, or father and son-in-law.

When the time arrives for the husband to fetch his wife, he takes with him three sheep (two rams and a young ewe). The ewe he presents to the mother to enable them to call one another Pakerr, i.e. the giver and receiver of a sheep, or mother and son-in-law.

The two rams are slaughtered together with two others, which the girl's father provides.

[1] Formerly no Masai was able to marry until he had been on several raids, but nowadays they leave the ranks of the warriors (il-murran) and settle down as married men (il-moiyak) at a comparatively early age.

262 [415]

Ore 'n-gulye-tíkitin náinoi.

in gourds. Some drink it pure; others mix it with milk[1].

There are a few other things which the Masai eat.

276 Enyasi il-mórusk oo 'Egorŏyok ol-kumbau áitushu-laki e-makat o ol-kumbau loo-'l-murran. Netii 'l-oock too-'n-gumeshi ol-kumbau oidoŋgo, nŋji en-giengi. Netii sii kulikse oock too-'l-mŏtio.

Some old men and women chew tobacco mixed with salt and *Osimum sanctum*, whilst others sniff ground tobacco up their nostrils: this latter is called snuff. Others again smoke pipes.

Ĕok sii 'l-murran, kake mŏok pŏkin. Menyasi ninje 'l-ayok araki 'n-doiye ol-kumbau, nemŏok; etoni aka.

Those of the warriors who like it also take snuff. The boys and girls, however, neither take snuff nor chew tobacco[2].

437 276 [349] Metumil-Maasse ol-kumbau, amu maiytio satuturu; kake ainyaŋgu too-'l-meek, ŋinoiye eng-erno oo 'n-dare taasti.

The Masai do not grow tobacco themselves, for they do not know how to dig. They buy it from savages, exchanging it for butter and lean goats.

Meniraki 'l-Maasse 'l-meek in-giaku supati, 'n-giaku olupin aka oo nemesta kulla, oo náiba 'l-aabo, ninje aka emiraki 'l-meek, oo 'n-dare mórusk oo 'n-dasati.

The Masai do not sell good cattle to the savages; they only give them barren cows, or those which have no milk, or which do not care for their calves. These and old or lean goats and sheep are the only animals they part with.

273 Nŏok sii 'l-mórusk in-aishi, neinyaŋgu 'l-marusn o en-joi too-'l-meek.

The old men drink honey-wine, and they purchase from the savages two kinds of beer, called Ol-marua and En-joi.

262 'N-gera aka náinoe en-aisho najon. Pŏki en-dŏki nainoe il-mórusk te-'n-aisho najon il-changaro aka.

It is only the children who like wild honey: old men eat the comb full of grubs[3].

[171] [1] This custom is also common among the Bari (Kaufmann, *Schlichtungen*, p. 170).

[556] [198] [2] In olden days it was the privilege of rich old men and their chief wives only to take tobacco, which was called ol-chani loo-'ng-ayok, the eye-medicine.

[825] [322] [3] The Masai obtain their honey by following the *Cuculus indicator* bird.

Wild animals.

The Masai ate the flesh of no wild animals when in olden days they all had cattle; but some of those who have lost all their cattle are now beginning to eat venison, like the Dorobo. [178]

If Masai boys kill elephants, they only take the tusks, which they exchange for cattle.

When buffaloes are killed, the hide and the horns are kept. From the former the warriors make their shields, and from the latter mortars are cut in which medicines are ground. The medicine-men also use the horns to put stones in for their prophecies. 239 [914] [915] [187]

[1] It was recently estimated that the Masai in the Naivasha Province own 15,000 head of cattle and approx. goats and sheep. Those living in the Ukamba Province and in German East Africa are, however, much poorer, most of their cattle having died of rinderpest some years ago. [233] [184]

[2] The northern Masai sometimes use o-singir (pl. i-singiri) for a fish. The southern invariably use o-singiri (pl. i-singir).

#648 195

Sir Charles Eliot's report.

In his report on the East Africa Protectorate, dated the 10th of June, 1901, Sir Charles Eliot describes the Masai as " perhaps the most remarkable people in East Africa. . . . . The greater number are still warlike nomads, who roam about over the Rift Valley and the plains between Kilima Njaro and Naivasha. . . . .

" The spread of law and order has somewhat curtailed their exploits, but the men are still all warriors by profession. . . . . .

" The Masai are found in both German and British territory. When the last Chief, Batyan, died, a dispute arose between his sons, Lenana and Sendeyo, as to the succession, and the tribe was divided. The former is now recognized as Chief of the Masai in the British sphere, and the latter of those in the German. Sendeyo has several times had trouble with the German authorities, but has always been defeated. Fortunately for us, Lenana's familiar spirit advised him that he had better make peace with the white men, because they were invincible, and he has proved our best friend and ally among the natives. In return, he receives £6 13s. 4d. a month, which is a very moderate stipend for a monarch of such considerable powers, both real and imaginary. Though I see no reason to anticipate that Lenana will change his present attitude, I regard the Masai as the most important and dangerous of the tribes with whom we have to deal in East Africa, and I think it will long be necessary to maintain an adequate military force in the districts which they inhabit."

[illegible]

At this date, the Masai in the East Africa Protectorate had been placed in a district of their own, called the Masailand District, whose headquarters were at Naivasha.

Inclusion of Uganda Provinces in East Africa Protectorate.

By an Order of the Secretary of State for Foreign Affairs, dated the 5th of March, 1902, the Kisumu and Naivasha Provinces of the Uganda Protectorate were included in the East Africa Protectorate, and the Naivasha Masai therefore came under the control of the latter Protectorate.

Uganda Railway.

The construction of the Uganda Railway was commenced in 1895, and the line reached the Lake in 1901. Throughout the construction period the Masai gave no trouble whatever to the workers on the line.

Sir Charles Eliot's report, April, 1902.

In his report on the East Africa Protectorate, dated the 18th of April, 1902, Sir Charles Eliot writes :—

" I agree with those who do not think the Masai are a formidable element in East Africa. It would, of course, be unwise to irritate them, and there is always some danger of misunderstandings in dealing with a people of whose language we are profoundly ignorant. But it appears to me that, even within the last year, the Masai have become more amenable. They have taken to wearing red blankets, and the astonishing exhibitions of nudity, which were common a year ago, are now comparatively rare. Lenana even wears a greatcoat and is one of the judges at the Naivasha cattle show."

[illegible]

Later in his report he writes :— " The troops, which are under the direct management of the Military Department of this Protectorate, form the 3rd Battalion of the King's African Rifles . . . . . One company at Naivasha is composed of Masai. There is no doubt of the warlike powers of this tribe under their own system, but military authorities differ as to their qualifications for service in a disciplined army. Colonel Hatch's last report on their capabilities is, however, very favourable, and his only criticism on them is that they cannot stand service on the coast. There are many advantages in employing the Masai as soldiers and police, for they are little disposed to cultivate, and if we are effectively to stop their ancient occupation of cattle raiding, we must give them something else to do. In some ways they answer very well : they are extraordinarily active, and have better notions of honour and loyalty than most tribes, but it would clearly be rash to trust too much to Masai troops and Masai police in Masailand."

The following quotations are made from the Protectorate Annual Report for the year 1903-1904:— The year 1903-1904. GAR* 175

"About the beginning of September last, it was reported that the Masai contemplated a wholesale raid into the Kisii country; the adoption of prompt measures, however, both in this province" (Ukamba) "and at Naivasha, prevented any carrying out of their intentions. Since that time they have been quiet, with the exception of a party belonging to the Matapato section, which secretly organised a small expedition some two or three months ago; the kraal concerned was found, and the 'laguenan,' or head warrior, is now a fugitive, the raid having been unsuccessful. With the exception of these two incidents, the conduct of this tribe has been satisfactory. . . . . ."

"Nothing of great political importance has occurred in this district" (Naivasha District, Masailand) "during the year. In the autumn of 1903, the Masai held a large circumcision festival on the plains of Kinoqop (or Kinangop). This was attended by several thousand tribesmen, and it was thought by some that the event would be commemorated by the dispatch of a large party to raid Lumbwa, Kisii, and, possibly, the German territory at the back of Thirati. Though the idea was discredited by those on the spot, it was considered advisable to make a military demonstration in the neighbourhood of Naivasha to discourage any breaches of the peace. At any rate, the ceremonies on Kinoqop passed over without incident. Curiously enough, about this time, a large war party of Masai did make a raid on the country east of Thirati, but, owing to warnings sent by us in anticipation of such an event, little damage was done, and the raiders were dispersed by the German troops. Our German neighbours appeared to be under the impression that Senkoro organised this raid, but what 'ainonen,' or warriors, formed the war party seems to remain in obscurity. The ainonen of what may be termed the Naivasha Masai are undoubtedly loyal, and will do their best to discourage raids by the ainonen. [561]

"The executive officials in this district who may be considered to be in the confidence of the tribe, report that the ainonen discuss the question of raiding quite frankly, and often enquire what is to become of the poorer ainonen, who have no live-stock, and thus cannot marry and settle down as 'Ainonen,' or Elders, and now raiding is forbidden, do not see how they are to acquire wealth. Numbers of them earn a bare livelihood by herding the property of their richer friends, others serve in the King's African Rifles and police force, and those in regular Government employ, steadily save enough to start them in married life. It is probable that a partial solution of this problem lies in the formation of a labour bureau, the object of which will be to find suitable employment for the poorer ainonen and 'Laish,' or youths, who have not attained the status of warrior." GAR* 175 MR 469

As distinct from the Masai Nation, the history of which forms the subject of Chapter III., the early history of the Masai contains little further of interest. The administrative steps which have been taken on their account from time to time have been treated separately in the following chapters, and Masai raids may be said to have ceased after the year 1903, the last year in which they carried out a successful expedition against another tribe in the Protectorate. Their more recent raids against German territory, are referred to in Chapter VII. GAR* 175

With regard to the potentialities of the Masai as a tribe, it must be borne in mind that the total population of the Masai in the Masai Reserve numbers no more than 43,000. Of these, it may be assumed that about 20,000 are males of all ages, while some 4,500 are Muran. Taking the proportion normally maintained among other native tribes, for which more accurate statistics are obtainable, it is found that approximately 10,000 males are boys under the age of the Muran class, while the remaining 5,500 are elders. It will thus be seen that the tribe under consideration is relatively small in regard to population, and that, therefore, specialisation will be necessary if the attributes of the tribe are to be utilized to their fullest capacity. Population. 162

Sufficient has already been said of the conservatism and slothfulness which are the dominating characteristics of the Masai. The state of idleness in which both young and old live has proved a barrier to progress which has resisted all efforts made in the past to introduce development on civilized lines. The only measure which has attained to any degree of success in the establishment of trading centres, where a carefully controlled trade has opened the eyes of the Masai to a small extent to the advantages of imported articles, and has created some desire on their part to invest a proportion of their enormous capital in trade goods. Even so, it appears that they have not been induced to desire anything more progressive than flour, sugar, and honey in the way of food, and such imported articles as umbrellas, blankets, cotton sheeting, knives, axes, and cooking pots. They are still in a most primitive state. Conservatism. 181

The semi-military organisation which has been handed down by their ancestors is still preserved, and continues to act as a deterrent to any innovation. Now that raids are ended, the Muran have nothing to occupy their attention, and it is this fact that has rendered it necessary to consider the possibilities of developing them into useful citizens along a definite line of policy, rather than to adopt merely normal administrative pressure, which has been so successful among the other tribes of the Protectorate. Of their own free will, the Masai will do nothing except fight with the weapons they know, and the young men of between sixteen and twenty-five years of age have now no occupation of any description. It is on behalf of these youths, the Muran, that the first steps in the necessary policy must be taken. Employment for the Masai. 178 479 561

It is known that, by their training from their earliest years, the Muran are experts in the handling of stock. Each boy has been accustomed to herd hundreds of head of cattle since the days when he started to walk, and there is probably no other nation in the world that can boast such a measure of success in this branch of knowledge. But, after circumcision and the assumption of the status of warrior, the youth leaves the care of stock to younger boys, and his ability in this direction is thereby wasted. Stockmen. 464 561

It is said that about fifteen per cent. of the Masai of the Muran class are employed by various farmers in herding cattle, but, even to this extent, the value of their services is largely discounted by the aversion which they show to the performance of work which they consider to be derogatory to their dignity—and the limits of what is not undignified are very materially confined. Manual labour of any kind is regarded as objectionable, and the Masai are physically incapable of carrying loads. But, if they are given a wage high enough to satisfy their avarice, if they are considerately treated, and if they regard the climate of their employer's land as suitable, they cannot be improved upon as cattle herds. The Employment Bureau. [461] [149]

In normal times, the number of settlers in the Protectorate who would make use of this class of labour is not large, and the demand for public purposes is smaller still, while the utility of the Masai as a whole in this connection is greatly diminished by their dislike of working for a European whom they do not know, and by the weakness of their constitution, which renders them suitable for work in a restricted area only. In order to make the Masai suitable for general employment even as cattle herds, therefore, it is necessary either to alter their conception of their dignity so as to make their services of more general application, or else to insist on their performing for a smaller remuneration the work that they will consent to do. Demand for Masai labour.

7: Hailey G-4 (No date) 1950 FL12 Masai FL12

authority always tended to break down in face of the lawless and independent spirit of the Moran. In 1918 the Headmen numbered 46, of whom 28 were unpaid, and 18 received pay ranging from £6 to £36 a year, the former Paramount having a special pay of £90. Fourteen of the 18 paid Headmen were presidents of the Native Councils, and following the custom adopted in many other parts of Kenya, they were given the courtesy title of Chief.

SUBSEQUENT CHANGES IN THE SYSTEM

In the period that has passed since this system was introduced, there have been changes which have to some measure affected the structure of Masai society. The restraint exercised on cattle raiding has robbed the military organization of its former importance, while the growing value of cattle and sheep has enhanced the position of the wealthier stockholders, who now constitute, together with some men of hereditary prestige, an aristocratic element with an acknowledged leadership in Masai society. In other respects the Masai hold tenaciously to their customary institutions and mode of life, and the Moran in particular retain the tradition of indiscipline (in all but a military sense) and the aversion to labour which characterized them in the past.

The Government has in the interval effected changes also in the system of native administration above referred to, with the view of adjusting it more nearly to the pattern followed in other parts of Kenya. The Central Masai Council and the 14 Native Councils gave place in 1930 to two Local Native Councils, at Narok and Kajiado, which have now been formally constituted under the provisions of the Native Authority Ordinance of 1937. The system of tribunals has also been revised, as will be further explained below.[1] The Headmen have been divided into two grades, Headmen and subheadmen, of whom the former have the courtesy title of Chief. They now derive their powers from the Native Authority Ordinance of 1937.

The 16 Headmen have a pay ranging from 17s. to 70s. a month, and the 28 subheadmen a pay ranging from 10s. to 32s. 50 cents a month. Practically all the Headmen or subheadmen are stockholders, and represent the ruling Age-Grade in each of the different Sections; very few of them are educated or literate and only a few can speak Swahili. The Headmen and subheadmen constitute the executive agency of the District administration and of the Local Native Councils, and they are in addition charged with the collection of the native Poll Tax. That is a task which they are said to discharge with some efficiency, though as will be shown subsequently in dealing with the administration of the Tribunals, there are numerous cases of the evasion of tax. The Chiefs can call on the services of a small number of Tribal Police, recruited and controlled by the District Commissioner. Up to 1943 the Tribal Police were the only force of this nature in the Province, but since that year a unit of the Kenya Police Force has been stationed in the Narok district, largely in view of the prevalence of stock thefts.

THE LOCAL NATIVE COUNCILS

Of the two Local Native Councils, that at Narok has 10 nominated and 23 elected members, and that at Kajiado 10 nominated and 14 elected. There is, however, little difference in practice between the nominated and elected members, since all are in fact selected by the District Commissioner after

Kisonko

C. Modern adaptation of the Laibonate — increase in local ceremonies — payment of fees — right to demand girls — extra-tribal contacts attitude of Masai to Laibon and spiritual matters in general — conclusions.

178 791 The main factor altering the position of the laibon is the enforced prohibition of cattle raiding. As pointed out above, the supply of charms for cattle raiding was one of the Laibon's chief functions. The first effect of this change was to reduce the laibon's status, in addition to cutting off his main source of income. Some continued to draw glory and dividends by continuing the practice in secret, others, more loyal to the new order, sought for something to replace this loss. It is difficult to assess which motive was uppermost, love of power or greed for cattle, but whichever it was, the reaction was the same. It consisted of an intensification of another of their main functions, viz. providing charms for, and prescribing the ritual for, local ceremonies. This is thought to have been less important in the old days, but it is now the laibon's chief function and principal source of income, and as such merits attention.

791 The nature of the ceremonies has already been briefly described and with regard to their frequency, it is improbable that a year passes without some ceremony or other taking place in every area of the district. An aspect not yet touched upon is that of the method of collecting the fees paid to the Laibon.

791 561 In respect of the cattle paid for the *age grade ceremonies* their number seems to be laid down either by custom or by the laibon himself, (I am not sure which). They are collected by general agreement from the members of the age concerned, after long discussion. A point of interest is that members of the Engidong clan are not expected to contribute, but may add a 'present' of their own, e.g. in one instance encountered, in the proportion of 8 Engidong cattle to 40 from other clans. But what is very striking about these levies is that the Masai in general are seldom sure for what they are paying. When enquiring about a known mob of cattle, one may be told that they are the fees being paid by the Dwati age in respect of their Ngeherr ceremony, or by others that they represent payment by the Dareto age in respect of their Unoto, or promotion. One can only conclude that the general public do not really know for what they are paying; they have been told to contribute cattle, and do so without further enquiry.

791 789 In the matter of *local ceremonies* the situation is different. The idea of holding such a ceremony frequently arises from an old man having a run of bad luck — his cattle or children dying, or his wives not giving birth. He calls a number of his neighbours together, they discuss the situation and decide that a visit to the laibon is indicated — thus the movement starts. Other local ceremonies may be sought when the area in general is affected by drought or disease, or again the laibon himself may remind an area that he has not heard from them for some time. This may be done, for example, in the following manner: when the laibon is throwing the bones or is in a trance deciding some matter for a Naberera deputation, he will suddenly switch round and say, "I see the Moibo people

9:Fosbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

After going through the ceremony, the new elders can drink milk alone, eat meat that married women have seen, carry about short bladed spears (*embere sero*) in place of the long polished warrior's spear; in fact all the customs of warriorhood are abandoned. 561

On return to their homes those who are not yet married do so at the earliest opportunity. Those who are married, if their fathers are still alive, move off from the paternal boma; for they are now in complete control of their cattle, and if they stayed with their fathers there would be constant bickering on animal husbandry matters. [591] [578]

From the foregoing it may be concluded that the average Masai male spends at least 10 years of his life as a moran. What are his economic duties and privileges during this period? In olden times his primary duty was to defend the country and, by raiding other tribes, to maintain and increase the cattle population. But European intervention has deprived him of his main occupation, and the only duties which the moran by custom seem bound to perform to-day are (a) drawing water from wells for his father's cattle or superintending their watering at flowing streams, (b) cutting the thorn tree branches which form the fence of the boma, and (c) escorting home night-bound cattle or searching for lost beasts. It was natural that few everyday tasks should be imposed on the standing army, but although the military duties are now in abeyance, the moran have retained the privilege of freedom from responsibility together with many other perquisites. These include access to the unmarried girls and the right to demand milk in any boma. In the matter of bullocks for slaughter in *ol pul*, the camp at which the moran may alone eat meat, the warriors seem to have a fairly free hand; if an elder withholds his consent, his moran son (with friends) will frequently help himself. It is not improbable that with the prohibition of raiding the moran exert these privileges in greater degree than they used to. If the elders are to be believed they spent a considerable portion of their time as warriors absent from home on raids, living in the bush on stolen cattle preparatory to stealing more. Consequently the time which they spent wandering round the bomas making their demands must have been considerably curtailed. [648] [178]

Another duty, or rather, restriction placed on the moran was abstinence from tobacco and beer. The former is largely breaking down, but fortunately the latter still holds to a considerable extent. This is not so with the Arusha, amongst whom drunken brawls between groups of moran are not infrequent. [273] [276] [184]

The above largely refers to the unmarried moran; once they settle down, even before the ngeherr ceremony, their mode of life is practically indistinguishable from that of a newly made elder.

Elderhood is in itself marked by different stages, each of which has its own privileges and responsibilities. The members of the generation immediately above that of the moran are mostly concerned in family matters, establishing their own gates, marrying and performing ceremonies to ensure the fertility of their wives. The generation next above the most junior elders, as explained earlier in this chapter, is responsible for the

9:Fosbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

The organisation of these deputations is actually a magico-religious rather than a political duty — that is, from our point of view — to the Masai it is just one aspect of the general theme of ensuring peace and prosperity to the area. 624

It will also be noted that there are very few duties which might be called executive. The laigwanan does not enforce judgments, or visit bomas collecting cattle for the laibon — the matters are discussed in open baraza and the weight of public opinion compels the individual to act as required. When this fails there is nothing to take its place. This explains why the laigwanak often make unsatisfactory paid headmen. Frequently the action required of a headman has not got this necessary weight of public opinion behind it, and consequently there is no indigenous method of enforcing an order. 626 624

The relations between senior laigwanak and their juniors are very lax. It is probable that this is due to the prohibition of raiding and consequent reduction of the occasions on which large-scale communal efforts are required. In the old days when large groups of moran got together for raids the senior laigwanak must of necessity have asserted his position, and the others must have obeyed him, to ensure the success of the venture. With decreased opportunities of asserting his position, it is natural that the power of the laigwanan should itself decrease. 624 178

Another tendency to be noted is the manner in which laigwanak move from their areas, more especially during elderhood. A senior laigwanan of the Kiteto lives at Naberera, one from Engare Nanyuki at Ngorongoro, another from Engaruka at Piaya ,each at least a hundred miles away from the people they are supposed to lead. This is only another aspect of the break-up of the sections previously recorded, but it does illustrate the loss of old loyalties.

C. Other officials — the launon — magico-religious position — his duties — the ol buro engene — the losurutya.

At the unoto, or promotion ceremony, there is chosen an official known as the Launon, — *ol aunoni* pl. *il aunok*, — or Olotuno. He is acknowledged by all the sections which attend the unoto, as their ceremonial or religious head. The position is not popular, so the candidate has to be installed by compulsion. After appointment the launon takes on the mode of living of an elder, being given a wife and cattle by his age-set. 561 624

The duties of the position are obscure, but as far as is known the launon appears to be a sort of scape-goat for the age. If he flourishes and begets many children, and if his cattle prosper and increase, it is a bad omen for the rest of the age. But his adversity will indicate the age's prosperity. [187]

He must do everything in advance of his age-mates, marry, settle down, make the final payment that binds the marriage. It is as though the moran, standing on the brink of elderhood, send forth the launon as an explorer into the unknown country, so that any bad luck which may be awaiting them shall be focussed on one individual and not on the whole age.

9:Fosbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

614 a woman of his own clan. But in certain cases groups of sub-clans within the clan may inter-marry (as shown on the chart), but when this occcurs certain payments called *enganyit* are made.

The true status of the Laitayok is discussed elsewhere (Sect. 1) their clans are shown on the chart separate from the main body of Masai clans.

423 One of the most important aspect of the clan system lies in the ownership of waters. It appears that in the old days, when a new country
614 was conquered, each moran, so far as he was able, claimed a water on
628 behalf of his clan. Thus all the Naberera and other Central Masai wells are in clan ownership, as also are the springs round Losogonoi, Kibaya, etc. The senior member of the clan resident on the water is in control, and, in consultation with the other local clansmen, determines the order of watering.

The main practical application of this knowledge is that in effect the users of the water form a council for the settlement of disputes, under the 'chairmanship' of the owner. For example at Landanai a dispute arose as follows:—

A migrating Masai may demand, and must be given, water at any well or spring, when actually on the move, drinking in priority to any local cattle. A moran claimed this privilege at Landanai, the elder who was watering his cattle refused, and a fight ensued. The local users of the water reached one decision in the matter in the absence of the 'owner' of the water; when he heard of this he was furious, called another meeting, and the original decision was reversed.

In other words, when waters are in clan ownership, there is a definite system of settling disputes arising from the use thereof; further, as the clansmen frequently meet on the water, other matters — marriage, debt, etc. — come up for settlement before the tribunal.

The value of these tribunals should not be overstressed, since in
[184-178] many cases waters are not in clan ownership; where water is abundant, as in a river or furrow, the water is communal, (*engare loongishu*): in other areas where recent migration has ousted the original owners, the clan system does not apply.

614 In certain areas clan feeling manifests itself in other ways. For instance at Laitokitok in Kenya the Molelian and Laitayok have separate manyattas, and act independently in certain tribal matters. Near Loliondo it was found to be of great political advantage when the Laitayok were given a headman of their own. In the course of this survey, only one other clan concentration was discovered, namely the Laitayok at Engasumet, where this clan forms two-thirds of the total population. Local government can, therefore, be given a strong clan bias in that area, and in other areas which may be found in future to contain large numbers of a single clan.

614 The feeling that the clan owns jointly all cattle in possession of the
422 clansmen manifests itself in numerous ways. For instance, members of the Engidong clan are not supposed to contribute to the cattle taken by deputations to the laibon — himself an Engidong — but may add a
OVD present of their own. When blood-money is paid, it is less when the

THE COIFFEUR OF THE MASAI WARRIOR

By H. F. I. Elliott

302 It is surprising to find that in Hollis' standard work on the Masai there is no precise description of the head gear of the 'moran' or warrior. No doubt the fashion has been described somewhere, but some details of present day practice in Tanganyika Masailand may perhaps be put on record here.

Of all the distinctive features of the Masai, this is the one which attracts most attention from the casual traveller and invites references to 'Roman Centurions', 'Red Indians' and the like. Its advertisement value is certainly considerable and not ignored by the Masai in their conscious [186] or unconscious efforts to preserve their identity. Certainly removal of the coiffeur and its concomitant red ochre has a surprising effect in [144] obliterating Hamitic characteristics of feature and bringing out those derived from the new liberal admixture of 'Bantu' blood.

561 It is still so customary for youths after circumcision to adopt the traditional garb, even though they may be sons of progressive parents 302 and themselves have been to school, that there might well be an 'old ● 178 school pigtail' for graduates of the Masai school. It is by no means unusual to hear a pair of pig-tailed and ochred 'moran' discussing their performances in some inter-house football match of their school days, while leaning on their spears in the precincts of a cattle market.

302 There are many varieties of head gear to be found in Tanganyika, one, two, three or more pigtails, the 'ridged helmet' style, heavily plastered and loosely braided styles, but it seems to be purely a matter of fashion and not linked with clan, section, age set or even locality (except in so far as fashions naturally tend to be localised). The construction of all is basically the same and the result is covered by the single term 'Ol daika'.

The materials used in the head gear are as follows:

[824] (i) a length or lengths of pliant but straight stick one foot to fifteen inches long, cut from the tree known as 'O-siteti (*Tamarindus indica* L.; the name is also applied to the shrub *Grewia* which may serve the same purpose at highland altitudes).

(ii) a strip of the inner skin of a sheep an inch wide and two or more feet in length.

[283] (iii) several feet of fine string made from ox gut or tendon.

[824] (iv) a foot or two of cord made from the 'ol-reteti' tree. This tree is, I think, correctly identified by Hollis with a species of fig, *Ficus Hochstetteri*; the cord being prepared from the aerial rootlets. But there is some doubt in the matter which perhaps a reader of this note may get an opportunity to clear up. For Battiscombe

684 *Boyhood. Sex Life.*—In past times uncircumcised boys were severely punished by the warriors if they had sexual intercourse with a girl of any sort. This is no longer the case, probably because the warriors are afraid of Government interference should they ill-treat the boys. [178] [648]

Should an uncircumcised boy have intercourse with a married woman he may, when his time comes to be circumcised, fail to find an elder who will sit behind him according to custom and hold him during the operation, but may have to sit unsupported. In an instance which I observed a boy who had so offended was circumcised in due form on payment of a fine of four oxen. [304]

881 561 The elders who decide when a new circumcision is to take place are those of the *Ol-Piron* generation to that which is about to be circumcised.

Ol-Piron means a firestick, and its significance is explained below under organization of generations and ages.

Ceremony of Seizing the Ox by the Horns.—The Masai call this ceremony *Embolosat o ol-Giteng*, which means the tearing of the ox. *Ol-Giteng* is the general word for an ox and is not confined to the one used at the ceremony. It must be performed first by the Il Kakonyuki section. I have not seen it performed.

881 *Circumcision.*—I will endeavour to describe a circumcision as I saw it. On my arrival a few minutes before sunrise the two boys who were candidates were standing naked and shivering outside one of the village gates. They had previously been completely shaved. An old man poured a little water over each from a pannikin. Ox hides were brought out and each boy sat on one. Each boy was held by an elder sitting behind him. They were just outside the village with their backs to the thorn fence which encircles the village. The operator appeared and circumcised each in turn. He was a Kikuyu and performed the operation with a dirty-looking razor of a type made in Birmingham or Germany. [304] [413]

As soon as the operation was finished new sandals were put on the boy's feet by the elders; and the elder who was sitting behind him stood up, still holding him, and walked him off backwards through the village gate.

As soon as both boys had been circumcised the operator rushed off to repeat the performance at a village near by before the sun was high. I went back into the village with the elders. One of them drew blood from the neck of an ox for one of the candidates. We went into the hut of the mother of one of the candidates, where the boy sat silent on a bed while we elders refreshed ourselves with honey wine. The boy is not allowed to speak for a period after the ceremony, but I have forgotten the length of the period. [273]

A branch of a tree is tied to the front of the boy's mother's hut by leather thongs passed through the wall.

561 178 *The Novitiate.*—Nowadays the novices do not need to remain in this stage till all the other candidates have been circumcised, but shave after a few months. They

12: Fox G-5 (1925-1930) 1930 FL12 Masai FL12
Kenya

are often called *I-Sipolio* or *'Laibarton* (*see* Hollis, p. 298, Pl. XIX). They shoot at girls with wax-headed arrows, and a girl who is shot must then give the novice a ring, which is usually, if not always, of a special type, being very much curled and twisted. The novices must observe the following rules :— [56] [178] [301]

They must enter the village before the cattle every evening.

Must not drink blood or cut meat or touch it with the hand.

Must not wash.

Must not have sexual intercourse with girls (this is not kept strictly).

Must not fight or be struck by anyone. Anyone who strikes a novice must put milk on his head.

Must not go out in the day time without the head-dress of stuffed birds.

O-Singolio, plur. *I-Singolion*, is the general word for any dance. (Cf., p. 191.) [535] [192]

Warriorhood.—The Age-group system plays such a large part in the tribal organization that I will deal with it in detail.

A right-side circumcision is called *E-Murata e tatene* = the circumcision of right. A left-side circumcision is *E-Murata e kedyanye* = the circumcision of left.[1]

Each of these groups is called *Ol poror*, an age-group. Each age-group takes a temporary name soon after circumcision and receives a new one at its *E-Unoto* ceremony. For example, the present age of Purko warriors was called *Il-Tiegi* prior to their *E-Unoto*, when they took the name of *Il-Salaash*.

A right and a left age-group together form a larger group, which I shall refer to as a generation in contradistinction to an age. The term for a generation is *Ol aji*, but it is also often loosely designated as *Ol poror*.

Speaking generally, each section has a different name for its warrior age-groups. The exceptions are (*a*) Loita and Siria. (*b*) Kabutei, 'L Odokilani and Matapato, who respectively share a single *E-Unoto* ceremony and therefore have age-names common to their respective groups.

The generation names emanate from the Kissongo in Tanganyika Territory and are common to all the Masai. They are given soon after the warriors of the combined ages have become elders. Thereafter the age-names tend to fall into disuse and be replaced by the generation-name. [184] [552]

A large number of names is given in Hollis, p. 263, but forms an indiscriminate mixture of age- and generation-names.

In the following table I have confined myself to names in everyday use in order to avoid errors and make for simplicity.[2] It will be noted that several sections do not have a left-side circumcision. In the remaining sections the right side is more popular than the left.

[1] I do not know the origin of the terms "right" and "left."

[2] For other generation-names *see* History, *infra*.

13:Huntingford E-4 (no date) 1953 FL12 Masai FL12
Agricultural Masai

439 whose warlike qualities appeal to the Masai. Honey, honey-wine, and ivory are got from the Dorobo. Ivory was used in the old days for trading with the Swahili caravans for cloth, beads, wire, and so forth. Trade outside Masailand is conducted [126] mostly by the women, for by mutual arrangement they were allowed to pass unharmed from tribe to tribe even during the progress of a war.

Hunting

224 Though the Masai do not hunt habitually, and [illegible]ise those who do, they used occasionally to kill wild animals—elephants f[illegible] tusks, buffalo and eland for the meat and hides, ostriches for their feath[illegible]on and leopard to protect their cattle.

46 Although deprived of their only real occupation, fighting, the Masai have not yet as a people accepted any substitute for it, being, as Sandford noted, "too proud to work," i.e., for wages. A small number have accepted employment as herdsmen on farms, and some have done good service in the Police and K.A.R., though even in a military capacity most of them are still unwilling to submit to a form of discipline that is not their own. Though a few have taken to cultivation, the majority have not yet consented to stoop to what they consider labour unworthy of a Masai.

THE AGRICULTURAL MASAI

101 The agricultural Masai, the I-Lumpua (Lumbwa) and Il-Oikop of former days,
175 are people of Masai stock who, having lost their cattle through disease or defeat,
[178] were forced to take up agriculture in order to survive, and by so doing earned the lasting contempt of the pastoral Masai. It is in most cases uncertain how long the various groups of Il-Oikop have been agriculturalists; some of the southern Masai, for example, were defeated by the Gogo early in the 19th century and took to agriculture. Fischer in 1882 reported groups of "Wakuavi," as he called them, living on the southern edge of the Mau; at Ndaseriani (Ndare serian), 15 miles south-west of Narosura; in the region known as Nguruman (*in-kurman*, "the farms") for about 30 miles north of Lake Natron; at the southern foot of Mt. Meru; and at Kahe.[8] Von Höhnel adds Ndaskera, 20 miles north-west of Lake Natron.[9] Another group is named by Thomson and von Höhnel[10] at Taveta; while the map in Hollis's *The Masai* shows them as extending for about 100 miles south-south-east of Lake Manyara. The best known, however, are the northern group called Il-Tiamus or En-jemusi (Njemps) near Lake Baringo, concerning whom we have (such as it is) the fullest information.

184 With the exception of the Taveta group, the agricultural Masai in general
22 resemble the pastoral Masai in appearance, dress, and general culture, and though they cultivate the ground, still have the acquisition of cattle as their chief ambition. Those of Taveta have mingled with the Taveta,[11] and have become the most successful cultivators among the Masai; the rest of the agricultural Masai in the days of Thomson and Teleki grew mainly eleusine and millet, while the Il-Tiamus grew also pumpkins, and tried unsuccessfully to grow maize. Most of the agricultural Masai supplemented their diet by hunting, bee-keeping, and, where possible, by fishing.

/12 cont./

619 142 144 In connection with the somatic view of the three Masai branches[1] the following is to be considered. The band that immigrated last, the true Masai, have kept themselves quite pure as a race. They [727] practically never subscribed to the kidnapping of women and children in war, otherwise customary everywhere in Africa, they did not [171] [582] [563] marry Negresses and did not take Negroes into their community.

291 301 142

Fonck II photo.

Ill. 2. Three Masai women.

619 142 144 Therefore they most clearly show the racial characteristics peculiar to the Masai people. The same was true of the Wakuafi until the [178] time when they became sedentary. Then, however, they needed [361] not only replacements for their lost cattle, but also many hands trained in the cultivation of the soil. For this reason on war expe- [727] ditions they dragged off, not only the livestock of the enemy, as before, but also the women and children. The degree of mixture between Wakuafi and Negroes is very different in the individual

[1] [i.e., the Masai, Wakuafi and the Wandorobo --Analyst]

/31 cont./

517 For the most part an atmosphere of dullness and boredom lies
535 over the kraal of the married (eng ai el morusk). Only on moon-
[533] lit evenings /32/ do the women amuse themselves with song, especially if a few warriors are there on a visit and give the impetus for the gaiety. Women and warriors dance in separate groups. For dancing the women station themselves in a row, move forward a short distance, then make a "right turn" and, with short steps, dance in a row back to the former place. The married men dance only on festive occasions, but by themselves. The text of the accompanying song naturally refers to the life prevailing here.

517 Otherwise quiet prevails in the family kraal after darkness has
521 set in: in good weather the people will sit for a while in front of
513 the huts, silently or softly conversing, and go to rest already at 8:00 o'clock or 8:30.

621 Even 12-14 years ago, before the Masai lost their huge
592 livestock-holdings in two great epidemics, each family had its
178 own kraal; now, on the other hand, almost everywhere several
233 families live together.
751

In the morning life begins around 4:00 o'clock, at which time
512 the women fetch the quite young calves from the compartments
[462] and take them to the cows, where they remain for the driving out
[233] to pasture. At daybreak the milking commences, for which all
[234] the women appear. After it is finished, breakfast, consisting of
264 fresh milk, is taken. Milk, soups, and thin porridge are drunk
[512] from gourd bottles; foods of greater consistency are put in the
[262] mouth with the fingers. Meat is partially cut up with a knife and
[415] completely torn into bits with the teeth. The hands are not washed
[412] before a meal. Smacking and belching while eating show good breeding. Men and women eat apart and have their separate vessels for eating and drinking. Those of the latter are shared by the children. If the man wishes to eat in the hut, the woman has to leave it beforehand.

/46 cont./

583 [586] father-in-law must return the bride price if he grants his daughter admission. If the woman who has run away has had children, her husband keeps them: in this case the woman's parents do not pay back anything.

[431] [607] [572] On the day the parents-in-law receive the bride price, the bridegroom gives the eldest brother of the bride a year-old heifer, each of her other brothers and each sister of the bride a male head of cattle. This is only a gift of friendship and has nothing to do with the bride price. Exchange of wives occurs, but does not result in a valid marriage, any more than does wife stealing. On the other hand, it is not infrequent that the girl flees from her maternal hut as soon as she reaches marriageable age and runs to her love. It often happens then that the girl's father sends a band of boys armed with sticks after her so that through the beating she will be induced to return. Since the boys act at the command of the old man, neither the bridegroom nor anyone else may hinder them. In order to protect the girl from such violence, only one course remains to the bridegroom, to leave the kraal with her immediately and move into the forest for a few days. With this he makes it understood that he will oppose with weapons anyone who might still venture to take his bride from him and at the same time it deprives the girl's father of any further right to object. As soon as the couple in the forest have consumed a cow, they return to the kraal, where, without further ceremony, [613] they are recognized as married. Only the girls of the Il magesan and Il kiborôn do not have this possibility of self-help, for both lineages believe that a girl who goes to her lover in order to remain with him as his wife without her father's consent will die in only a few days after the flight.

582 614 178 [731] [613] In olden times the bride was not supposed to belong to the tribe of her bridegroom. The livestock epidemics of the last 20 years, however, which resulted in the death of many thousands of Masai, have modified this law somewhat. Accordingly, /47/ a man may marry a woman who belongs to his tribe, but not to his lineage, whereby in individual districts there is the further prerequisite that the girl came to him of her own free will and, after being sent back

/47 cont./

582 [614] [178] [585] [613] [561] by him one or more times, returned to him again. Although such a legally perfectly valid marriage takes place, the bridegroom in this case often pays no bride price. Moreover, the bride is not supposed to be from the lineage of the bridegroom's mother, nor should her mother belong to the lineage of the bridegroom, or her father to his age class (1)

1. Cf. Chapter IX of this part.

(ni bomo) or to his age-class association (ni adji). The bride may not be from an older age class or the same one, or a much younger one than the bridegroom.

Younger brothers are not supposed to marry before the older brother, younger sisters not before the older sister, but as a rule they can buy permission for the marriage from them by paying one or a few head of cattle, in the place of which now, when the Mosi are poor in livestock, a couple of pots of honey often appear. A marriage between foster brother and sister is not permitted; this is regarded as [613] incest. Moreover, the man may not marry two women from the same lineage; it is precisely in membership in the same lineage that consanguinity is seen, and wives of a man may not be consanguineously related.

[569] [128] Moreover, a marriage between relatives of blacksmiths and those of nonblacksmiths is not permitted.

[587] Widows (ab gulial, b gulia) or divorced women who have living sons may not marry again, but live with men who belong to the age class of their deceased husband, if there is no other obstacle to marriage between them. Difference in standing is in practice an [565] obstacle to marriage insofar as the poor man does not have enough livestock to pay the bride price for the daughter of a wealthy man. [595] The man may not enter into a further marriage until at least two months have elapsed since his last wedding.

585 The wedding feast, allegedly in accordance with an ancient custom, is popularly set for the third day of the month. The wedding company consists of the relatives and friends of the bridal couple and the inhabitants of the kraal in which the bride's parents live.

/79 cont./

They consist of curves, sectors of circles, lines and scallops, which are painted on the shield's surface in three colors. Pompeian red, black, and gray (1).

1. Gray is very rare. Black and red, on the other hand, are represented on every shield of the warriors.

with which white belongs as a fourth color, /79/ serving as the background color for the shield's surface, from which the colored designs stand out in sharp contrast. One uses for this the red earth mixed with blood or with the juice expressed from the fruit of the *Solanum*, *coccylanthum*, further the white earth that is found in various places on the steppe, which is mixed with water, and, for black, pulverized, charred gourd shell. Gray is produced out of charred and pulverized cattle bones.

Today considerable confusion in the shield escutcheons already prevails. The more the war expeditions of the Maori become, thanks to European domination, the more the old formalities of warfare are sloughed off, and ancient rules, which formerly were never transgressed, are today all too often ignored; their purpose has lost its meaning in the changing times. A further blurring in the shield escutcheons came through the Lessee-Zendee civil wars, in which, for the first time, long-lasting struggles between the Maori are taking place. The confusion in the escutcheons in and of itself intimates as here only as one of the many visible proofs of the relaxation of the old strict organization. Therefore a special description of the present-day, often arbitrary escutcheon figures may be omitted. On the other hand, it is important to establish the rules according to which the shield escutcheons were made up.

A shield escutcheon (Plate 1) may contain 1. the red warrior-emblem (*ne mere' rainigi*), 2. the black emblem (*ne mere' ewiki*) (1).

1. To which the rare gray also belongs.

3. the ceremonial band (*ne wapu i ai ahi*), 4. the escutcheon of the lineage, 5. the emblem of the warriors, ect. family, 6. an emblem

[i.e., the shield escutcheons--Amiyet]
[See pp. 606-607--Amiyet]

/31 cont./

The illustrations give the lineage emblems that the members of the ol mantanyi age class carried before the livestock epidemics around the year 1890. It furthermore seems that even in the times in which the carrying of lineage emblems was customary they were not generally carried by all lineages, but only by those whose members predominated in number in the part of the country concerned. The practical utility of this mode of procedure was to keep constantly before the eyes of members of other lineages the fact that those lineages were particularly strong and that therefore the individual belonging to them was entitled to a larger share of the spoils, in accordance with the principles might comes before right. The emblem of such a lineage was then also sometimes adopted by all the warriors of that part of the country.

These warriors who take the lead in battle, the ol kiguimi, have the right to carry the emblem of bravery on their shields. This is the small colored emblem that is on the periphery of a longitudinal side and is to be found in Figures 8, 10, 15, 16, and 17 of Plate 1. It is still commonly used today.

The last emblem that may be included in the shield ensemble is the one mentioned above as the section emblem. By section is to be understood here one of the many small divisions out of which the camp of a troop found on a war expedition is made up. In accordance with its secondary significance, the emblem is not very striking to the eye. A comparison of Illustrations 11 and 12, Plate 1, shows an example. These represent the ensembles of two shields whose owners belonged to one company and within it to different sections.

It is also to be mentioned that both the shield ensembles as a whole and its individual constituent parts were probably always dependent on fashion and other circumstances of the moment. Sometimes simplicity was fostered, sometimes gaudiness. Sometimes a close feeling of connubiality prevented the carrying of the clique-forming lineage emblem, sometimes several shield bearing groups of panel law or civil law called forth the opposite. The above-mentioned shield paintings of old men proved to me that the shield ensembles of a province were uniform during periods of successful warfare. On the other hand, /32/ one can observe almost daily on the lower reppes that

/[illegible]/
nowadays the warriors, out of boastfulness, go on using shields, with unshaped ornaments, taken as booty in battle with Dogrows (1)

1. The fact that Dogrows also carry shields of the Miami type, and, as he says, with similar ornaments, is a consequence of the above-mentioned innovation.

or half-breeds of Dogrows and members or bastards of the Miami people so, with the present discord, even those of other Miami.

The shields of the ai hanan, the recruits, do not appear as gaily colored (Plate 1: Figs. 1 and 2). As soon as the youths have received the shields, they ask the most esteemed of the married men, a former speaker of the warriors, for his consent that they be permitted to paint a black emblem on the surface of the shield. At the time he gives his permission, he also determines the form of the emblem, that is, he does not invent a new one, but chooses one from among the old familiar ones. With this end with an ornamental band only drawn in

III. 31. Shield ornaments of young warriors.

/120 cont./ If they
181 spare women and children in war, it is not out of compassion, but
[567] solely in order to make them useful as slaves, whereas the Masai do
not keep such. In general one cannot attribute to them a lasting
vindictiveness toward their own kind. The Masai only in part
possesses the courage attributed to him. Their extraordinary impu-
dence often makes them appear more courageous than they really
[593] are. Their sensuality equals that of most East African tribes. The
[837] wife is at the disposal of every man who belongs to the age class
[561] (both oi horor and oi adji) of her husband and desires her. It is
593 obvious that, as a result of such conditions and in conjunction with
the prevailing polygyny, there can be no question of a proper family
life in the higher sense. For her own husband the woman is espe-
cially the labor force that he needs for household and livestock
management and the means of fulfilling his wish for as many progeny
as possible. Accordingly her treatment depends on how she measures
562 up to these tasks. Moderate beatings are not uncommon, but rough
461 treatment almost never occurs. In contrast to the men loafing
[462] about lazily, the women are busy all day long. For the married
[517] women there are scarcely any amusements except dance and song;
they had their share of them before their marriage, when they could
have their fling in the warrior kraal. In public life, as well as with
respect to her own husband, the wife has no rights. Of course the
Masai woman does not regard her servile position as such. She knows
nothing else, and fortunately one does not miss a comfort that one
562 does not know. As soon, however, as she is transplanted from her
461 own tribe into a foreign one through kidnapping in war, her willing-
• 178 ness to work immediately comes to an end. The less oppressive
177 her new position is, the lazier and at the same time more demanding
she becomes. She suddenly regards herself as too good to work, and
her desire for clothing and adornment often increases immeasurably.
/121/ Accordingly, her interest in the household becomes less to the
point of disappearing and her passion for amusement great. The reason
for this phenomenon undoubtedly lies in the fact that she regards life
among the hated and despised oi mŋg as a disgrace and the work re-
quired of her by them as an insult inflicted on her.

/166 cont./

832 (without, however, one's being able to speak of steatopygia), robust
826 hips, deep umbilical cavity. The lips must not stand out, either by form or color, so that thin and dark lips are considered beautiful. For
[302] tongue and gums an artificial black coloring is regarded as beautiful:
(124) for this one uses the juice of Clerodendrum tenuiflorum (1).

1. Ol oimoro 'gieche 'el ojabe.

Prominent muscles in the upper arm and calf or a fat belly are regarded as ugly and are contemptuously compared with the like characteristics of the Negroes, or one also speaks mockingly of club arms, or calves with a goat stomach stuck in them, or of a /126/ diseased swollen abdomen. Among girls one places value on small hands, small, narrow hands and feet, as well as even, hemispherical
[302] breasts. By means of painting with red earth one seeks to enhance the dark skin color by the contrast of colors.

XV.

000 Weapons. -- Spear. -- Sword. -- Scabbard, belt, shield. -- Club. -- Bow. -- Arrow. -- Firearms.

411 The foremost weapon of the Masai is the well-known, beautiful, large spear /Ill. 41 appears here/ (Fig. 27, see pp. 166 ff.). It constitutes all the pride of the warrior, who would assume part with anything but that. The spear consists of three parts: the /127/ upper iron blade, the middle wooden shaft, and the lower iron shoe. At the lower end of the blade and at the upper one of the shoe, respectively, one finds a socket by means of which these parts are
411 stuck on the wooden shaft. The ancient spears had blades 30 centi-
* 178 meters long and 20 centimeters wide, with short sockets, a long wooden shaft, and a short shoe. Gradually the socket of the blade was lengthened up to 40 centimeters, and the shaft was shortened in the same proportion. Such spears are still to be found only rarely today, and then the blade on them has been ground more or less narrow in the course of the years. Later, fashion lengthened the

[TEXT CONTINUED ON PAGE 168]

/137 cont./

411 wide blade up to approximately 60 to 65 centimeters and at the same
• 178

Fig 41. (Ia)

time decreased the socket to 10 to 12 centimeters. Fine specimens of such spears are still frequently found. The modern spear of today has a narrow blade, usually about 50 to 55 centimeters long, sometimes even still longer, which measures only four to six centimeters at its lower, widest part, a short wooden shaft 10 to 15 centimeters
411 long, and a meter-long shaw. The blade is almost always brightly

/151 cont./

411 grasps a pencil in writing. 3. The spear is carried on the shoulder
412 upon which its center of gravity rests. The point is directed diagonally upward: the hand encircles the spear close with the fist.

411 The sword (Fig. 31) consists of the round, wooden hilt, provided
178 with transverse grooves, and the iron, double-edged blade. The former, according to the statements of the Massai, has not changed, whereas the blade had undergone a great transformation. Originally it was only 20 centimeters long and had its greatest width of barely two centimeters in the center. At that time the sword resembled a double-edged dagger (Fig. 32) and was suitable only for stabbing.

411

Fig. 32 a. (1/3) Fig. 32 b. (1/3)

411 Gradually the blade became longer and, in order to be able to use it
178 better for cutting, its center of gravity was put closer to the tip, so that the blade now 60 centimeters long has its greatest width of three centimeters only five centimeters away from the tip. What was said
[191] about the cross-section of the spear blade also applies to that of the sword blade: its cross-section is slightly S-shaped (Fig. 33 f). It is made by blows with hammer, straight or by shape rasping (Fig. 33 g). The

/191 cont./ The beautifully worked scabbard (sé ɛlɛnkíɛ, á ɛlɛnkíɛ [Fig. 31 c and 32]) is made from goatskin or neat's hide and dyed with the red juice of the root of the shrub ol gwɛrɛndɛ l-ɛɛ ɛɛɛ (1):

1. Plumbago zeylanica.

on the back side is found a longitudinal middle seam and on the front side a corresponding longitudinal fold. Twelve centimeters from the upper edge /192/ of the scabbard there sits on the front side an oblong eyelet (ol ɛlɛnk, ol ɛɛɛɛnkíɛ) through which the belt (sé ɛlɛnkíɛ, á ɛlɛnkíɛ [Fig. 33 b]) were around the hips is stuck. The latter is made of neat's skin and decorated with several longitudinal folds. There is a hole (sé ɛɛɛɛɛ, ɛ ɛɛɛɛɛ) at one end, and at the other one a small leather strap (olɛ ɛɛɛ, ɛɛ ɛɛɛɛ). The sword is worn on the right side and drawn with the right hand. Left-handed men wear it on the left side. This carrying method seems to point to the fact that formerly the people did not carry swords, but daggers, for a sword can be drawn with the right hand better from the left side, whereas a dagger is more quickly ready for a thrust from the right. Moreover, the sword, even today, is also frequently handled like a dagger.

According to the tradition of the people, the original Masai shields were very small (shield = ol ɛɛɛ). They had a circular, flat shape, a round umbo in the center, and a diameter of 50 centimeters. The grip stick was fastened on the back side with small straps, which were drawn through the shield. The very light shield was carried with two fingers at the grip stick. Accordingly, the hollow of the umbo was very small. Gradually the shields became larger, and the reason for this may be sought in the frequent conflicts of the Masai with peoples carrying bows and arrows. Since in its original shape, the shield, with its enlargement, lost firmness, this was increased in that a wooden frame (ol ɛɛɛɛɛ, ol ɛɛɛɛɛ) was sewed around the outer periphery with strips of goat or sheep skin, the shield was bulged out, and, to preserve the longitudinal convexity, two straps (ɛ ɛɛɛɛɛɛɛ)

/132 cont./

were drawn from each end of the grip stick to the grip (Pl. 34). The present-day shields, like the former ones, are also made out of buffalo or giraffe skins. For better protection of the hand, the umbo is lined with a round patch of the same skin, and, on top of that, in order to prevent the chafing of the finger knuckles, with a piece of soft sheepskin. The shields now in use, measured with the convexity, are 1-1.10 meters long and half as wide. The escutcheon is painted on the front surface of the shield, whereas the reverse side often -- not always -- bears the lineage coat of arms.

On the march the warrior carries the spear with one hand, the shield in the other one. With arm hanging down, the hand grasps the shield grip so that the smaller diameter of the shield is vertical and the painted surface is turned outward.

The club (ol gimda, el gimd [Fig. 35]) is now made out of one piece, generally out of ordinary hard wood, especially from the tree ol oirida and ol olborbenek (1):

1. Dregea rubicunda K. Sch.

only the clubs of the speakers, which serve solely for gesticulating, are made out of ebony wood or rhinoceros horn. The old clubs /133/ consisted of two parts: the spherical head, into which the sticklike handle was stuck through a central bored-hole. The club does not actually serve as a weapon of war; except for accompanying a speech, it is used almost exclusively in fights and -- to break marrow bones of slaughtered livestock. The present clubs are about 40 centimeters long, their head has a diameter of five to six centimeters. A clublike cudgel (os sire), especially out of the wood of ol gadardar (1),

1. Ochna Merkeri Gilg.

often takes the place of the club. The club is worn in the sword belt; it sticks in it as a rule close to the sword, with the head upward.

Fig. 36. (1/10)

Spear, sword, shield, and club are the weapons of the warriors. Old people never carry the shield, rarely a small, to some extent case-off spear, or an old sword, but for the most part only club and bow with arrows. They need bows and poisoned arrows for the defense of their own kraal or against predatory animals. The Masai impoverished through cattle epidemics, who live apart from the others and erroneously call themselves el dorobo, also hunt game with them. The bows (Fig. 38) are two-shanked, simply curved.

233 [561] [857] Small livestock and donkeys are tended by little boys, cattle by older boys, under the supervision of a few old men. Dogs are no longer used for this now; rather the livestock heeds the whistle or call of the herdsmen. To what extent this is the case is best demonstrated when Masai flee with herds of livestock. A number of men, shouting and whistling, run before and behind the herd, which rages across the steppe in a mad chase. In former times the [231] [178] herdsmen quite generally used dogs. The dogs did not serve so much to keep the herd together, but more for guarding. They announce the approach of predatory animals by barking or by hastening to the herdsmen.

231 [262] [272] /174/ As has already been mentioned above, fresh livestock blood alone or mixed with milk forms a food prized as quite particularly nourishing. The blood for this is drawn off the living cattle and goats in the following manner: A strap is tied around the animal's neck in such a way that the blood returning to the heart in the large vein is blocked by it and breathing is not affected. Then a man [311] [315] shoots an arrow (Fig. 76) with a bulb-shaped, thick tip (ol horet), from which projects a scale-shaped sharp piece of sheet iron six to eight millimeters long and equally wide, into the swollen vein, whereupon the blood squirts out in a stream and is caught in a gourd bottle (ol bugurl). The bleeding is stopped by a simple untying of the strap after the operation is finished. From a strong bull or ox approximately four to five liters of blood are drawn at one time, from a cow only half as much, and this is repeated every month. No blood is drawn from good milch cows and cows with young calves. Blood is drawn from sheep by means of an incision in the depression above the eyes or between the eye and the middle of the forehead. The slaughtering of cattle is done by a stab in the neck after the front and hind legs have been fettered; goats and sheep are suffocated by having their mouths and noses held shut. Cows are never slaughtered, not even when they are too old to be used for breeding. 231 262 561 Livestock that has died is eaten. As soon as the animal is dead, one removes the skin from the neck, severs the neck veins, and catches the blood flowing out in the skin. The cutting up of a head of cattle is done with the greatest care; almost every single muscle is carved

/285 cont./

#539 Musana's wife was called Darangé, so named after a like-named area; her father was called Tôdi. The boy Logîna and the girl Tarsîti are named as children of Musana and Darangé.

At a later time God summoned to him on the mountain two influential old men, one from the lineage of the 'N darasero, named Mîkûnî, the other from the lineage of the El muikgo, named Kîlî. When they had almost reached the top, they saw a large fire on the peak of the mountain and heard the voice of God resound from it. God said: "Because the el magg (1)

• [178]

1. In the old language the unbelievers were not called el magg, but el donja (sing. el donjal).

are bad people, I shall no longer protect them. The Masai may fight them from now on; but no blood may flow during this and therefore the Masai are to set out for battle armed only with sticks. You may not kill any el maggi, but you are to take away the cattle of all of them."

The el Bartuam were followed by the El mairah. Whereas previously the Masai had been governed by an el aiokani, from now on an el olbani was to rule over them. Thus one day God summoned a man named Kidohoi, that is, the tailed one, for, according to the legend, he had a tail about a hand-span long. Kidohoi belonged to the tribe of the 'L aiser and founded the lineage of the El gidoi. After Kidohoi arrived on the mountain, God appointed him el olbani and gave him the el gidoi horn and the medicines for the making of the amulets (2).

2. e'mancho el olbani; the old word for e'mancho is en dalehei (pl. en daleheï).

Then God continued: "From now on the Masai may marry more than one woman."

/305 cont./

*121 are based on a common primeval idea, or the fourth, that those
*173 myths of the Masai originated in primeval times. We shall find the
*171 answers to these questions in the following.
174

If we consider that, after the Masai left their original homeland
*121 in Arabia, the civilized state of Egypt, with its mental life alien to
*173 the savage nomads, developed at their backs and through that cut
174 them off from further influences from the Near East, we may probably
• 178 assume that they, for whom, by persisting in their original mode of life and independence, any motive for cultural development in a new direction and for adopting alien ideas and customs was lacking, were able to preserve for us the ethnography of that common original homeland most purely and originally.

*121 The mental life of the Israelites and the Babylonians was already being led out of its old path into a new one by their becoming sedentary. The nomad thinks and feels differently than the agriculturalist, and the latter in turn is remote from the mental life of the town dweller. To a people becoming sedentary, not only the ones displaced by them, but also their already sedentary neighbors introduce /306/ new physical and -- among primitive peoples not infrequently just through this -- new psychic elements as well: through the friction and fusion of these arises the progress out of which then develops what one usually designates as civilization. Of the three peoples interesting us here the Masai are on the lowest level of this evolution, the Babylonians on the highest, and between the two poles hover the people of Israel, clinging to the old by adhering to monotheism and drawn forward toward Babel despite the polytheism prevailing there and their resistance to it, by the pressure arising or fostered owing to a stay of 400 years in Egypt and the seduction resulting from it. Many passages in the Old Testament give evidence of the struggle and reconciliation of the two directions; yet in ideal matters the original interpretation almost always retains command, whereas in practical ones, in questions of daily life, gradually the view modified by the advancing civilization, therefore principally by Babylonian influence, struggles upward and presses into the foreground (1).

1. This is reflected most clearly, of course, in the law.

18: Merker--472 G-5 (1895-ca.1908) 1910 FL12 Masai FL12

/348 cont./

121 illegal and immoral, because they run contrary to our consciousness
177 of justice and our Christian morality, and which cause to arise in the economic field exploitation in the crassest sense of the word. Now while every state that occupies a savage country has the duty to appear as promoter and guardian of justice and morality and at the same time to promote economic development by guiding production along the paths of our modern principles, along with that it only too often overturns the foundation pillars on which the existence of a primitive people rests.

182 Thus in plague-ridden Africa the Masai largely owe their existence
721 as a nomadic people, whose only resource lies in its livestock holdings,
178 to the fact that they can always replace their losses by expeditions of war and plunder. As soon as the possibility of such expeditions is taken
[648] away from them, or at least very much reduced, through the erection of military stations that grant protection to the victims of the Masai, there must naturally rise a situation in which a gradually increasing weakening of the vitality of a people takes place. What was formerly to their advantage, their war lust and the cowardice of the Negroes, now becomes fatal to them. Both entice them to raiding expeditions
[361] again and again. In order to avoid the punishment deserved for that, they retreat into regions that they formerly avoided as harmful to the health for human beings and livestock, or on account of inferior
177 pastures. If the Masai, when they came under the influence of the
182 European occupation, had still been the strong people of Mbatyan of 50 years ago, they might perhaps, after the example of other primitive peoples, have cleared from it even though a marked, nevertheless only a temporary weakening in the meeting with the higher culture, and then gradually recovered again when they had become ready for its advantages. But we found the Masai already in a condition that
182 lacked very much life vitality. The livestock epidemics around the
731 year 1890, which, no locally restricted, had afflicted the herds of all the Masai to such an extent that actually only miserable remnants were left, hd produced a general and extraordinarily severe famine. Hundreds of thousands of Masai, especially men and boys, fell victim to it, and in the year 1895 the author still found the steppes around Kilimandscharo appearing in places as though they

/348 cont./

182 731 had been sown with the bleaching skulls of those who had starved and out of the stricken animals. Any of the women and girls who had not died of hunger sought and found refuge among Negroes practicing [348] agriculture, who always like to buy or kidnap female individuals. A mother would sell her child for a handful of maize and would sell herself a day later for a similar price, in order to avoid starvation. Negroes and caravans /349/ took possession of the will-less ones, in order to resell them as slaves. Many have since come back, in part through flight, in part though redemption by their relatives, but more are still found in strange hands. The latter, even though their blood lives on beneficially in the new mixture with Negroes, are 182 permanently lost to the Masai people. So greatly has the misfortune, 731 to which an opposite effect is so often attributed, broken up the 669 former organization, the firm unity, that, soon after the end of the epidemics, the unhappy quarrel between the brothers Lenana-Zendeo about the undivided rule over the Masai could begin. With its continuing civil wars it acts powerfully toward the completion of the destructive work of the epidemics. The Negroes, with whom alone [726] the Masai formerly waged war, except for smaller undertakings [186] among themselves, which bore more the character of provocations than of serious battles, were opponents inferior to them. Now equal parties stand opposite each other, which makes the wars bloodier, more destructive.

178 Through increasing impoverishment as a result of these epidemics 241 and civil wars, there is now going on among the Masai -- as formerly among the Wakuafi -- a change from nomadism to sedentation. [433] Agriculture is taking the place of animal husbandry. The ones [361] deserting the "people" in this manner are founding settlements, in part self-sufficient, in part supported by Negro tribes, somewhat removed from the dry steppes, there where the watering is adequate for the laying out of plantings. No one expects them to prove to be particularly skillful at this; but Nature, which goes so far to meet her children in the tropics, helps here too. A moderate watering suffices to make the betata shoot stuck in the virgin soil grow and produce tubers. Maize for the most part appears just as easily satisfied as advantageous. These then are the principal useful plants

/349 cont./

178 241 that are started with as a rule and which one therefore finds in all the settlements. Yet despite the ease of production of the field crops, the transition to agriculture nevertheless is taking place in a way

178 182 164 165 that is reducing the population in extraordinary fashion. First of all, the acclimatization process slowly being accomplished demands a great sacrifice of human lives. The Masai, little afflicted with fever in the dry steppes, suffers with it quite seriously in the moist regions in which mosquitoes are permanently at home. Thus on two occasions in the same new settlement I found all the adults and many children sick with fever. Another one had just been abandoned by its inhabitants, leaving the sick behind. The ones left behind, principally men and boys, were badly reduced by fever and, in addition, suffered to a great extent from virulent leg ulcers, whose great extent -- in many cases they covered the entire lower leg, from knee to ankle -- probably is to be traced back to a general weakening of the body by fever and lack of food; for such ulcers are not common among nomadic Masai, and, where they occur, /350/ they remain smaller and show a tendency to heal rapidly. Other illnesses arise from the unfamiliar diet. The rapid transition [262] from an almost pure meat diet to an almost pure vegetable diet makes demands on the stomach and intestines that a body weakened by fever is seldom equal to. Sickness and death from this cause are frequent and are increased further by the consumption of bad water. Thus, more than half the people in one settlement complained of painful diarrhea and bloody stools. All these acclimatization illnesses seem also to manifest their effect in decreased [192] fertility of the women and increased child mortality. I was repeat- [161] edly struck by the small number of sucklings (two-year suckling period) and older children. Thus early in 1908 in Ngaruka, between Lake Manyara and Lake Natron, among a number of about 50 women, I found only twelve children, three of them babies. According to the statements of the parents, very many children had died of various illnesses, *especially fever, stomach and intestinal affections, several* also had perished in Masai attacks. For the Masai who are becoming 178 sedentary, the ones still living among the "people" as nomads are 619 a scourge that scarcely falls short of the illnesses just mentioned in 721

/350 cont./

178 619 72 [329] its effect. Hated as faithless and despised as agriculturalists, the sedentary ones are constantly plagued by raids that not only cause them great loss in human lives, but also take away any possibility for them to arrive at any improvement in their way of life by keeping livestock for the attainment of the meat and milk diet so necessary

[179] [144] for them. Moreover, the frequent intercourse with sedentary Negroes and caravan people leads to an increase in the cases of venereal diseases. Premature marriages of girls, which can not happen among

582 178 185 125 the Masai still living as nomads, is not rare among the sedentary ones and often enough leads to the death of the young woman who is scarcely more than a child and whose bony structure, despite her attained capability to conceive, is not yet developed. Finally, it

178 182 must still be mentioned that no doubt the longing for the formerly free life in the broad steppes and the feeling of humiliation over having become a so deeply despised cultivator of the soil oneself are factors that have a wasting effect. The latter circumstance also

[184] [179] [144] brings with it a decrease of national pride. The barrier that kept Negroes out of the community of the Masai has fallen. A disadvantageous race mixture hurting the people is slowly taking place. Among the Wakuafi this process was more rapid in their period. At

[148] [172] that time no European administration prevented their raiding expeditions in Negro regions, from which they brought home livestock and women experienced in agriculture.

179 176 In frequent -- almost daily -- intercourse that soon springs up and then continues to exist between the Masai who have become sedentary and the settled Negroes, the Masai naturally also share in the disadvantages that /351/ come to the Negroes through the encounter of their lower culture with our higher one.

178 179 361 We have seen how many difficulties sedentarization brings to the Masai, and it is therefore not surprising that a part of those who have already become sedentary give up their fixed residences again after repeated failures. These then often join the Wandorobo, to *live by hunting, and call themselves this.*

10/ before -- the Masai tribe occupied what is now Western Masailand by conquering and evicting the previous residents (Grant, 1957). The Masai were a fierce and warlike people. Once they had taken over that country no one seriously disputed it with them.

In the early 1900's through the Government of Kenya the Masai made a treaty directly with the Queen of England. This involved re-settling a segment of the Kenya Masai, but the long term effect was to put the Kenya Masai in a privileged position relative to the other tribes -- who did not have such a treaty -- and to give them a degree of autonomy virtually unknown in other parts of Kenya. Because of their remote location and the nature of the Tanganyika Administration, the Masai in the Tanganyika portion of Western Masailand also maintained a large degree of autonomy. Aided by these circumstances, the extremely conservative western Masai have kept largely to themselves, and to an extraordinary degree the modern world has gone on around them, instead of over them and through their country.

My first visit to the Serengeti-Mara Region was in 1956. I had been assigned to carry out a brief ecological reconnaissance of the Serengeti National Park under the sponsorship of the Wildlife Management Institute and the American Committee for International Wild Life Protection (Talbot, 1956).

19: Talbot K-4,5 (1956-1962)1964 FL12 Masai FL12

Their!

233 livestock, described below, consist of herds of cattle,
(232) sheep, goats and donkeys. The Masai way of life
revolves around the grazing and water requirements of
their livestock.

681 Their principal units of social organization, as
561 they affect this discussion, are sections, age grades,
679 villages, and families. Clans have a important place
179 in ethnological discussions and in some areas they
192 determine matters such as water rights (Fosbrooke, 1948).
One impression is that throughout most of Western Masailand
the concept of clans is of more ethnological than
ecological interest. One basic cause for this is the
effect of the Government administration in Western
Masailand.

With the physical and social upheavals
in both Kenya and Tanganyika from the 1900's through
about 1930, the establishment of African District
Councils (District-wide governing bodies), creation of
the park and conservation unit, and future development
projects, the clan and other social ties have been
greatly disrupted. Grant (1954, 1957) describes this
effect for some details that are about in the former
boundaries of the Serengeti National Park.

[i.e., the Masai.—Analyst]

44 warriors also carry a narrow oval shield made of buffalo or giraffe hide on a wooden frame, and painted with insignia including the warrior's age grade and clan.

561 701 Originally during the period of warriorhood the moiranl were not expected to do any work except fight. They lived in a separate village, called a [712] [542] [236] Kraalle, and were generally taken care of by the unmarried girls of the tribe. Discipline was reputed to have been extremely good. The warriors had older advisers whom they obeyed.

224 [223] [300] [401] Ostrich were hunted to obtain feathers for ornaments, buffalo and giraffe for shields, and lion for the highly prized mane. Traditionally the moran were expected to blood his spear on a lion. The dramatic Masai lion hunts are famous (Simon, 1962). At 177 178 present warfare and lion hunting are illegal. The abolition 561 701 224 721 result in a large body of young men with absolutely nothing to do for a period of up to 15 years of what could be the most energetic period of their lives. [223] They tend the livestock some, but much of the time there is nothing for them to do. As a consequence discipline is breaking down. The elders apparently have much less influence or control over the moran than they did

FL7 FL8 ZZ9 SA1 TM1 FL7 previously. There is a considerable amount of raiding to steal stock from surrounding tribes. This precipitated several minor wars when we were there, and administrative action prevented one major war with thousands of combatants. Some lives are still killed, and the warriors have been blending their spears on a variety of other attacks, most notably zebras.

SA1 Following the period of service as warriors, each age class goes through another ceremony. Two age classes, a right hand and left hand together, take the ceremony and they then receive another age grade name which they retain the rest of their lives. Thus these older age grades each span a period of about 25 years (Grant, 1997).

FL7 FL8 SA1 Periodically the administration has tried to discourage the moran system. In late years some of the elders have also tried to change the system in order to maintain better control over the young men. The system still continues in Western Masailand but it is much less regular than previously.

SA1 SA3 SA1 When a warrior becomes circumcised he may take his mother with him to the warriors' manyatta, or he may leave her home or apparently even stay home himself.

[illegible] entered in and under the dung in to shelter in a pool. Flow and virtually impossible to get out.

[illegible] Mosel also sometimes abandon a hole, or at least the house invaded, if a person dies in it.

[illegible] People who are very seriously ill are removed from the house at least during the day, often to a small three home with a shelter constructed nearby. They may remain there at night also. It was difficult to learn much definite about this practice. A disabled person spending the night outside a home is very likely to end up inside a kraal. The administration frowns on this [illegible] efficient method of disposal and consequently the Mosel have become reticent to talk about it. The sick persons' homes that we saw looked to have been occupied nights as well as days.

[illegible] Foods. Traditionally the Mosel are supposed to survive entirely on blood and milk (Shantes, 1960). In Western Moselland the Mosel also consume of pasta (maize meal), milk, meat, and occasionally blood. The [illegible] and sometimes pasta are eaten by the women and young [illegible]. The milk is collected in large calabashes. These calabashes, when indeed and sometimes scrupulously decorated with beads, are shown as much a symbol of the Mosel as the white blankets or cloaks, moran spears and [illegible] styles.

[illegible] herd. Each herd was stopped several hundred yards from the water hole. The herds were entered in the order of arrival, the first herd moving up to the hole, small groups detaching as there, then leaving and its place taken by the next herd.

[illegible] **Numbers of Animals:** The emphasis of the Masai is on numbers of animals, not on quality, and certainly not on any balance between numbers of animals and range productivity. The animals represent wealth in the broad sense. Goats, sheep, and occasionally cattle are traded for goods or sold. A certain number of cows are required for milk production. Beyond that, however, the Masai appear to regard cattle as a combination of status symbol, bank account, and object of reverence. The more cattle they have the better, and they see no point in selling cattle or trying to upgrade the cattle for that purpose. They do appreciate good livestock.

[illegible] Young boys often have a steer which they raise from a calf. They attach great importance to the condition of this animal. Milk, wealth and status appear to be measured in terms of numbers of cattle, whatever their condition. Any effort to reduce these numbers seems to [illegible] than a scheme to undermine their way of life.

[illegible] In Kenya there the identifying features mentioned

232 herd. Each herd was stopped several hundred yards from the water hole. The herds were watered in the order of arrival, the first herd moving up to the hole, small groups drinking as above, then leaving and its place taken by the next herd.

233 Numbers of Animals: The emphasis of the Masai
(234) is on numbers of animals, not on quality, and certainly not on any balance between numbers of animals and range productivity. The animals represent wealth in the broad sense. Goats, sheep, and occasionally cattle are traded for goods or sold. A certain number of cows are required for milk production. Beyond that, however, the Masai appear to regard cattle as a combination of status symbol, bank account, and object of reverence. The more cattle they have the better, and they see no point in selling cattle or trying to upgrade the cattle for that purpose. They do appreciate good livestock.
(235) Young boys often have a steer which they raise from a calf. They attach great importance to the condition of this animal. Still, wealth and status appear to be measured in terms of numbers of cattle, whatever their condition. Any effort to reduce these numbers seems to them a scheme to undermine their way of life.

236 In former times the limiting factors mentioned

*178 *233 above made it difficult to amass large herds for any long period of time. The cattle numbers probably fluctuated greatly, depending on factors such as disease and drought. The English administration has provided excellent veterinary services, all but eliminating most diseases. They have provided water holes in otherwise dry areas to spread the grazing pressure. Predators have been killed wherever they [721] molest Masai livestock. Cattle raiding has been considerably reduced, and in Western Masailand most of the raiding is by Masai augmenting their herds from neighboring tribes, rather than vice versa.

With the other natural limiting factors largely removed and no artificial ones imposed in their place there has been nothing to stop the increase in herds but the carrying capacity of their rangelands.

*233 291 In Narok District, for example, in April 1956 the cattle population was about 330,000 head (Dept. Vet. Services, 1956). By April 1958 the population had risen to about 378,000 head (Ibid.), and in May of 1960 it was reported at 450,000 head (Mann, 1960). This represented an increase of over 36 per cent in four years.

*233
231 We had the feeling, however, that donkeys just as other
SEP livestock are a measure of success and security, and regardless of the need some donkeys would be maintained.

*236 These donkeys are small animals whose weight
231 is probably less than half that of a wildebeest (i.e.
*233 under 200 pounds). They are quite independent. We often saw the small herds of donkeys leave a kraal unheeded and go to a water hole, then graze back to the kraal. This pattern probably would not be followed in areas where predators were common. But in the peripheral areas it appeared to be the rule.

* 178 Large numbers of donkeys appear to have been
231 the rule for some time. Jackson in a general discussion
*233 of East Africa in 1908 referred (p.61) to the "Masai, who graze immense herds of cattle, small stock, and especially donkeys..."

*233
FL Burros
231 The Masai burn grass whenever it is dry enough
F24 to ignite. The reasons they give for burning include the following: It produces a flush of new grass that is particularly palatable, nutritious and easily available for their livestock. It clears the musty growth and makes new grazingland. It clears or reduces ticks, tsetse fly, and disease.

*/34 In aggregate, the animals killed by the above factors -- predation, disease and accidents -- do not come near the numbers of animals that are born into the ungulate population. There must, therefore, be some other limiting factors. In the case of the wildebeeste, the age structure of the population (Fig. 48) shows that the greatest mortality is in the calf population during the first few months of life. The mortality here is caused primarily by cows becoming separated from their calves in the milling-about of large herds. This is a function of herd size. The larger the herd the greater the loss of calves. The size of herd is influenced by a complex of environmental conditions, described in detail in Talbot and Talbot, 1963b. Thus, the primary limiting factor in the wildebeest population appears to be environmental, acting through herd size.

It would appear that with other species also, the effective limiting factors involve environmental controls of one kind or another, or, in effect, the carrying capacity of the grassland ecosystem. This is not necessarily a self-regulating system, however. The balance that formerly existed included native hunting. This now has been largely stopped. One result of this protection has been the increase in giraffes. In the

TEXT CONTINUED ON PAGE 327

19: Tallot E-4,5 (1954-1962)1964 FL-12 Maasai FL-12

Rare giraffes have been effectively protected for about 10 years. According to personal accounts, they have increased greatly in numbers. The appearance of the vegetation confirms this belief. The trees preferred by the giraffes have a growing line about 20 feet up. Virtually no green leaves exist below the line, although there are many dead or leafless limbs lower, indicating that in the recent past leaves did grow lower. Almost no reproduction of the preferred trees can be found.

Elephants are another example of a species formerly thinned by hunting, and increasing with that cause of mortality removed. They have been protected along the Mara River since about 1968, and by 1978 the increase in their numbers was notable (Kenya Game Dept., 1978). This increase has continued. It is due in part to natural increase within the area, and part to immigration from outside areas where hunting is allowed. Tree destruction by elephants is significant in the area and was obviously increasing.

An increase in the populations of giraffes and elephants is readily apparent because of their obvious impact on the landscape. Such increases on the part of other smaller ungulates would be much harder to detect without particular accurate censuses. There has only

Glacier growth invaded the greenlands. Subsequent heating, modified by the growing of wild vegetation, has somewhat stabilized the invading thaw zones in a tide back or wooldand which fills the former open grassland surrounding the thickets, riverine forest and taller woodland. To some extent the invading thaw zones have been cleared from the flats near the watercourses. As described above, such areas tend to support better flora. Most of these areas did have drastic close crops are frequent.

With the increasing numbers of their livestock, the Masai have tried to clear as much land as possible for pasture. Their extensive herding, plus elephant damage to the more area, has been rapidly reducing the woody vegetation during the past 50 years or so. Their herding has been restricting the range of the native fly to the north. Yet while they are reducing the larger woody growth, the smaller growth such as Mbatiling Thaw is rapidly increasing as many of their grazing lands. In the Rift Escarpment static Non-crowded increases to growing land on the edges of the cedar forest are being off set by separation of the land covered by lacustrine body, which invades progressively underbrushed grassland in cedar forest areas to north the area any Mbatiling Thaw invades lower grasslands.

MAN'S ROLE IN THE GRASSLAND ECOSYSTEM

#13
FEB.
20

The Masai are not new and probably never have been in a real equilibrium with their environment. Their history as we know it can be interpreted as roughly parallel to a part of the Americans' exploitation of the United States; exploiting a bit of land and then moving on west until there was no more land to the west.

[72] The exploitation of land by the Masai was a very long term process until the advent of the Europeans. The combination of peaceful administration, veterinary services, and watches have greatly accelerated the rate of exploitation, but they do not appear to have altered the basic processes. The only difference is that this time the Masai have no more land to the west.

It would be interesting to know if this basic lack of equilibrium with the environment was common to other pastoral tribes in Africa and especially those who preceeded the Masai.

As described and discussed above, the grassland ecosystem in Western Masailand, including its wild fauna, is maintained -- and created -- by a combination of

CHAPTER 10

Masai Herds and Mara Lions

1

THE Masai have won respect by their contempt for civilization and all that it has offered them. For half a century Europeans have been tempting them with all the material bribes, indeed even non-material ones, for which every Bantu and Nilotic people is avid. There is scarcely an African of the far lands who would not sell his soul for a school certificate. The Masai have rejected school certificates with a proud and lofty disdain.

Will a certificate fatten a bullock or swell the belly of a cow? Masai hearts are with their cattle; they desire no finer destiny for a son than to walk in the dust of a larger herd than his father's. The young man who dreams of glory sees fine white bulls and trimmed cows and green grass knee-high; he does not see the stone bungalow, the shining motor-car, the well-cut suit, the framed diploma so alluring to his darker fellow-countrymen. He likes to wear his hair in matted pigtails smeared with red ochre and rancid butter, to stand with one foot against the other knee, to eat a compound of bullock's blood and curdled milk, to carry his long spear and to keep his women in their beads and rolls and fly-infested mud hovels as his ancestors did—those ancestors whose lion head-dresses and painted shields filled the hearts of lesser breeds with terror, and won the right of conquest over the steppes of eastern Africa from their northern forest deserts to their southern tsetse bush.

For the Masai have pride, and pride is a quality we recoil from in ourselves and half-admire, half-deplore in others. An Englishman today must stamp with the hob-nail boots of equality upon the little shoots of pride that cannot help but spring up in his heart; but when he sees the fine, free growth of it in others, an envious respect attacks him. For

He will ask where the huts of the members of the Aiuwi age are, and when he has been shown them, he will enter one.

When he has entered, the owner of the hut leaves him and goes to search for a place to sleep in elsewhere, the stranger remaining with his wife[1].

Or if the owner of the hut has several wives, he goes to sleep with one of them, leaving the stranger in the hut he entered.

A Masai cannot refuse hospitality to a stranger (of his own age) for he is afraid that the other members of his age will curse him, and he will die.

Cattle, grass, and milk.

The Masai love their cattle very much, and consider that nothing in the world is of equal value. As with people, each one is known by name.

There is a saying which is as follows:

"One cow reconciles a man's head."

They mean by this that if a man

[1] This note is p. 300.
[2] The Masai cattle are of the humped Zebu type.
[3] Ankermann (The Kraal of Africa, vol. 1, p. 112) writes with regard to the Dinka and other Nilotic tribes: "The poor savages . . . pay almost divine homage to their cattle which they hold dearer than wife or child." Kaufmann (Dschaggaland, p. 100) adds that on the death of a cow a Dinka goes into mourning as he would if a relation had died.

giving cattle, go around, smoke hands, multiply children, were circumcised, cattle 'e-gana, smoke children be-have-kindly.

Now cattle feed on grass, and the Masai have grass on this account.

Whenever there is a drought, the women fasten grass on to their clothes, and go and offer up prayers to God.

If a warrior lands a boy on the grazing ground, the boy leave up some grass, and when the warrior sees that the child has grass in his hand, he stops beating him.

Again, if the Masai fight with an enemy, and wish to make peace, they hold out some grass as a sign.

Whenever strangers return from a raid, and it is desired to purify those who have killed some of the enemy, a girl takes a small gourd of milk, and having covered it with green grass, sprinkles it over them.

Then, if people move from one kraal to another, they tie grass on to the gourds.

Should one man ask forgiveness of another with grass in his hand and his request be not attended to, it is said that the man who refuses to listen to his prayer is a Dorobo, and that he does not know about cattle.

Again, if a man who is proceeding on a journey sees a tree which has

2: Bernardi E, 36-4 (no date) 1955 FL12 Masai FL12

On the whole, these two authorities stress the linguistic unity of all the Masai. 197

The great majority of the Masai are pastoral, only very few tribes having taken to agriculture. The pastoral tribes follow a semi-nomadic way of life. "They move", writes Lord HAILEY,[1] "with their herds in order to avail themselves of the seasonal variations in water supplies, so that in effect they practise a system of rotational grazing". The same writer,[2] reports "a recent estimate" of Masai herds in Kenya which puts "the number of cattle at over 700,000, with 600,000 sheep and a large number of donkeys". For Tanganyika no given no figure. The above estimates show clearly enough how the attitude of the Masai to cattle is a paramount feature of their life. To own cattle is a privilege obtained through initiation, and large herds are a sign of outstanding social status. Cattle are the main economic interest and investment for the Masai.[3] 233 [22] 191 223 559

The total population of all the Masai may be reckoned at about 100,000. The 1948 census of Kenya's population (see Ibid.) gives for the Samburu an estimate of 20,000, and the following figures: Njemps 3,400, the other Masai 67,201. In 1931 the Tanganyika Masai were reckoned as 32,146. 162 [24]

* * *

Under the present political situation, the Masai are not administered as a single unit, for they are divided into two sections by the border of Tanganyika Territory and Kenya Colony. 63

In Tanganyika the Masai form one of the four districts of the Territory's Northern Province (the Masai District). In Kenya the main group inhabits the reserve adjoining Tanganyika Masai District, and constitutes the Rift Provincial District (Masai District) of the Colony. The other group (Samburu and Njemps) is incorporated with the Rift Valley Province (Samburu and Baringo District), and partly with the Northern Frontier Province. The geographical separation of the Samburu from the other Masai is the reason why the Samburu were considered, and are still considered, as a non-Masai tribe. But, as BEYER remarks, they are true Masai. The splitting of Masailand and the separation of the Masai were made 23 24 [101] 195

AN ADMINISTRATIVE AND POLITICAL HISTORY

OF THE

MASAI RESERVE.

CHAPTER I.

THE CHARACTERISTICS AND TRIBAL ORGANIZATION OF THE MASAI.

Peculiar policy necessary in dealing with the Masai—Why the peculiar policy is necessary—The tribal formation of the Masai—Social system of the general nation—"Laikipiak"—"Kisonko"—The class of the military organization—The uniform—The laibon—The Masai as a pastoral—Employment of the Masai—Social organization—Marriage rite—Consists of Elders—Laws in the Masai Reserve—Provinces—Masai Council—The Tribal Divisions—Purko—Lotia—Uasinkishu—Sale—Kaputei—Kisonko—Subdivisions—Little Tribes—Sperm—Sampuru—Ilkiperi—Ilkiperi of the Ilpurkuma—Ilkiri—Loitokitok—Kaputei—Ilpolori of Loitokitok—Wanderobo—Ilkaraio—Ilkiyakuma.

Reason why necessary to deal with the Masai.

WITH a view to the better understanding of the steps which have already been taken and of the policy which has in the past been pursued in dealing with the Masai situated within the limits of the East Africa Protectorate, it appears desirable, in the first instance, to complicate concisely the facts which have at various times been recorded on the subject of their tribal characteristics and peculiar organization, attributes which have rendered it impracticable to carry out in their case the policies which have been adopted in dealing with the majority of other tribes in the Protectorate. These policies, established and maintained for the most part by the native administrative officers in each Province, have undoubtedly not been uniform, but they have to a large extent achieved the result which is aimed at in the majority of the native administrated areas to-day, of developing the native inhabitants of the Province into useful agricultural labourers fit for continuous work on European farms and available for duty as units of public utility, and they have also, by maintaining the system of self-government recognized by each tribe, produced within the reserve, a type of native as well under control that the demands of the military authorities, large though they were, for natives to serve as porters in German East Africa were met from these Provinces without disturbance of any kind, in spite of the fact that complaints had to be resorted to and that the work was arduous, and, furthermore, they have so developed the system of native administration that the majority of the porters so recruited were obtained by the native authorities themselves, without the aid or intervention of the European administrative officers. The Masai were among the few tribes which came into contact with the administration but their conservatism has been so great, and their adherence to antiquated tribal customs and traditions has been so powerful that it has proved impossible as yet successfully to alter and reconstruct their lives.

Why the peculiar policy is necessary.

The Masai are a Nilotic people, closely allied to the Dorobo and Lumbwa and to the Ilchamus and Turkana. In common with these other four tribes, they possess a form of military organization which obliges all the male population between the ages of about seventeen and thirty to submit to a special discipline and to constitute a master class. It is, however, impracticable for the purpose of policy to compare the Masai with either the Ilchamus or the Turkana, which tribes have only recently come into touch with the administration, and a comparison with the Dorobo and Lumbwa, Masai and Ilchamus, displays a position decidedly unfavourable to the Masai. Though some of these former tribes have definitely

Employment of the "Boers"

How particularly does this argument apply to the "Boers" who are of the age at which the numbers of agricultural tribes are expected to work. No suitable employment has as yet been found for them as a body, though a small number have been known to reside as hawks on the farms of sympathetic European stock-owners who are willing to pay a high wage for a modicum of service and who will not insist on their performance of any arrangement labour. A very few also have proved efficient in the Police Force and S.A.R., while numbers of them, employed in the capacity of native boys have frequently proved of assistance in positive expeditions against other tribes.* but for the majority, all attempts to find a suitable form of employment have failed, and they continue to lead their idle life in the Reserve, where their attitude is one of concerted conservatism combined with opulent apathy. The discipline formerly necessary to their existence as a fighting race is rapidly falling into disuse, and the good qualities they once possessed are fast deteriorating. Many of them have continued in a feeling of boredom with their idle life but few have had the moral courage to change it for one of labour. This manner of existence is having a disastrous effect both physically and mentally on the Shona as a tribe, and it is stated that the average height of the "Boers" has decreased by three or four inches during the last fifteen years.

Main occupation remaining with tribe

It has been said that the Shona Reserve is already, with certain exceptions, stocked to its fullest capacity. Mr. Hunter has estimated the natural increase in cattle at 15 per cent, or approximately 100,000 per head per annum. It follows therefore, that a similar number must be disposed of or perish annually; but this is an argument which does not appeal to the Boers. They have not only shown a marked reluctance to sell their stock, but they have made no serious attempt to accept the assistance of science in improving the grazing conditions of their country, and, being satisfied as a result of the few experiments they have made that the class of stock they possess—a small, degenerate, so-called animal—is best suited to withstand the arduous conditions prevailing in the Reserve, they are unwilling to permit a cross-breeding with pure-bred or grade stock which might materially increase the value of their herds in the world's markets, and which would, by the introduction of hardy blood, obviate the ill-effects of in-breeding which has been practised necessary by the retention of stock. The wealth of the Shona, therefore, is hoard to no good purpose; their style of living does not change; they are still content to live in low buildings constructed of poles, grass and mud, in conditions of filth that defy description; and, although an improvement has been noticeable in recent years, they have shown no great desire to utilise their wealth in the purchase of imported articles and in the improvement of their diet.

Complaints of Boers

Another aspect of the character of the Shona "Boers" which deserves consideration is the disrepute which they owing to the authority of their own native administration as represented by the Councils of Elders. These Councils exist according to native custom, but have never been in the past, nor are they now, efficient to enforce the decisions they may give in respect of the young reactions. It may be said that serious crime in the Shona Reserve is rare, and that there are not more than three or four cases in recent years, since European administration was established, where the attitude of the "Boers" gave cause for anxiety and in no one of these cases did a disturbance of such magnitude occur as to render necessary a message to report here to quell it. Officially, the Shona have consistent loyal to the British Government since their first encounter in and except for isolated instances where certain sections attempted to help the rebel cause and to increase their herds by the capture of cattle belonging to the Matabele Chiefs, their conduct throughout the rising period when the chief in their tribe, was on their borders was exemplary. Nevertheless, a contingent of the contingent of the Shona will show a not inconsiderable number of indications

Crime in the Shona Reserve

G24 The Highland of the Baginbaul inhabit the country in the neighbourhood of the Pyong Hills and Ba Dakyen Bawk. To this division belong the subdivisions of the L'Daiet Chiefs of whom Saggi is now the chief. The Division is estimated to possess a population of 1,000 of whom 100 are Maras, 30,000 head of cattle, 40,000 sheep and 300 donkeys. Highlands of Ba Baginbaul.

G25 The O Dale Lakyeik came from Lashkiya in 1918 and are sometimes known as the Pyent Shans. They have a considerable admixture of Kakeyn blood in them. They inhabit generally the neighbourhood of Ba Dakyen Bawk and their population is estimated at 700, including some 70 Maras. They are said to possess 5,000 head of cattle, 20,000 sheep and 70 donkeys. Their Maras are divided into two "Sorks" named O Tawin and Sawn. O Dale Lakyeik.

The Lagwiet are to be found in the neighbourhood of the Pyent Shans. Their population is estimated at 2,000 including 170 Maras, and their possession at 30,000 head of cattle, 100,000 sheep and 400 donkeys. Their Maras are divided into four "Sorks" whose names are O Mahawn, O Shyeik, O Kahwan and O Sagyn. Lagwiet.

The Highland of Lakyikkyik inhabit the country to the north of Kikwaiyan, which country is owned by the Sagyen Kangyi, Kikaiktiro, Tawyawn, O-ai Tawak and Kwaiko streams. The population of this division is estimated to number about 1,000 of whom 100 are Maras. These are divided into two "Sorks," named O Kwak and O Shyeik. The live-stock possessions are said to number 30,000 head of cattle, 170,000 sheep and 400 donkeys. Highland of Lakyikkyik.

G23 In addition to the Maras, there are considerable numbers of Kyaiktaiks ("O Tawin") living in the Maras Reserve. These numbers are probably not less than three or four thousand, and many of them possess considerable herds of cattle, and live the life of ordinary Maras, from whom it is difficult to distinguish them. They may be conveniently divided into two classes, namely, those who live in the bush and forest, and those who possess cattle. The former possess little or no live-stock, and subsist almost entirely upon wild animals and forest, while the latter live in villages and subsist only to a very limited extent on game. Kyaiktaiks.

The former are to be found mainly in the neighbourhood of the Sun, but small parties of them are also met on the Tuse River, on the Lower Sun River, along the Indo border, and in the Tuse-Sun region. They live on raw cattle and the smaller game animals, in rough shelters in the forests, or in the huts in some of the Maras villages.

The latter are to be found on the Uaw River, in the neighbourhood of O Chaga and O Dakyen Kadin, on the western bank of the Sun River, and in the Sun country. In all, they probably number about 1,000.

G4 G24 There exists in the reserve, a special tribe of mixed ancestry similar to the Wanderoks, called O-Kawan, who claim non-magyan, but are treated as subjects, and are not allowed to marry Maras women. O-Kawan.

● (E) 105 To complicate the Maras are a hardy, conservative, doubtful people, nominally governed by Councils of Elders, who often themselves to be forced general to deal with the idle body of younger Maras whose views they have not disapproved, but who are still sufficiently backwoodsmen to render uncertain the outcome of their venture. They have been concentrated in one area, where they have amassed numerous herds of cattle of a poor quality and considerable sheep. No suitable course of employment has as yet been found for the males of the tribe as a whole, though they are experts in the care of stock, and have possessed fighting qualities of a savage nature, which spread the terror of their name far and wide. They have considerable honor qualities of organization, obedience and stability, but these are largely discounted owing to their unreliability. They have always evaded that O-A-Ja that has accounts to be loyal to the British Government, and have never been responsible for any serious disturbance, being too proud to work, and idle enough to disregard them, they are probably the most backward aboriginal native tribe in the Sun Valley Protectorate. Character.

[illegible]

[illegible]

[illegible]

[illegible]

It is possible that much of the mortality attributed to East Coast fever is really the death of a disease known as heart water, which is described as a tick-borne disease, very similar to East Coast fever. There is as yet no evidence to support this idea.

East Coast fever appears to be the only cattle disease which the Bunyoro really fear, and it is, in fact, the disease which seems to be the highest mortality among their herds. Nevertheless, they have not made forward very readily for treatment of the cattle dip which was started at Hoima in 1931, and it is evident that, in addition to the apprehension which generally fears from taking advantage of such an innovation, they are also not dull and fatten to go to the trouble of making the treatment a matter of regular routine. In fact, however, it is to be hoped that they will come to appreciate more fully the necessity which dipping imposes upon their herds, and, when this realisation has been achieved, it will follow that large herds of otherwise valuable grazing area will become available which, then, there for their and their stock, that tending to relieve the over-grazing which is now noticeable in these parts of the reserve which are considered by the Baker to be suitable for their cattle.

(b) Foot and Mouth Disease.

Foot and mouth disease has not given serious cause for anxiety in the Bunyoro Reserve. An outbreak was reported in June, 1931, and in February, 1932, it was felt to be very prevalent in the majority of the villages situated in the Hoima and Masindi districts. Accordingly, in that month, the Chief Veterinary Officer prohibited the removal of stock from the reserve.

The Bunyoro suffering from this disease is slight, but it very seriously affects the milk supply, and, particularly in respect of certain sections of Lake, an industrial activity being in a small state, are unable to move stock sufficiently to obtain the necessary milk adequate grazing and, as a consequence, they may die of starvation.

The disease was reported in May, 1934, to have practically died out.

(c) Tsetse.

Challenged fly have occurred in the Hoima Reserve for many years and the majority of which these cattle are immune. It was not in the Northern Hoima Reserve from 1930 until the completion of the years to 1933, and several cattle deaths in both the Northern and Southern Reserve were reported between November, 1933, and January, 1934.

Anti-challenged immunisation was carried out where practicable and a large number of Hoima cattle were thereby protected, with the result that the mortality was very low.

For the next five years statistics for years in the transport, but it became generally prevalent early in 1934, and heavy mortality occurred among the cattle, of which it was estimated that about 60% per cent. of the overall increase occurred.

The Hoima have proved to be opposed to the treatment of their cattle for immunisation against challenged, on the grounds that immunisation shall be attributed for the overall process of the survival of the fittest.

(d) Tsetse Fly.

During the year underwritten in October, 1933, by the Director of Agriculture, accompanied by Messrs. [illegible] and Chaplin, the Director of Public Works and the Chief Commissioner, South Kyoboga, an region of [illegible] fly were seen along the main thoroughfare and the cattle were with [illegible] and appear to be unaffected by the [illegible] fly. On a previous visit the Director of Agriculture had noted a situation of "Monopoly" and to assist that time fly was fairly numerous all over the Protectorate, but that at the one known in [illegible] and along main cattle [illegible]

[illegible]

[illegible]

[illegible]

[illegible]

[illegible]

With regard to the population of the Boers as a tribe, it must be borne in mind that the total population of the Boers in the Boer Reserve numbers no more than [illegible]. Of these, it may be assumed that about [illegible] are males of all ages, while some [illegible] are females. Taking the proportion normally maintained among other native tribes, for which more accurate statistics are obtainable, it is found that approximately [illegible] males are born under the age of the Boers, while the remaining [illegible] are adults. It will then be seen that the tribe under consideration is relatively small in regard to population, and that, therefore, specialisation will be necessary if the civilisation of the tribe are to be efficient to their fullest capacity. Professor [illegible]

Sufficient has already been said of the conservative and stubborn nature which are the dominating characteristics of the Boers. The state of affairs in which both young and old live has proved a barrier to progress which has retarded all efforts made in the past to introduce development on civilised lines. The only occasion which has attempted to any degree of success in the establishment of teaching centres, where a carefully controlled trade has opened the eyes of the Boers to a small extent to the advantages of organised activity, and has caused some doubt as their part to invest a proportion of their surplus capital in trade goods. Even so, it appears that they have not been induced to make anything more progressive than bows, arrows and boomerangs in the way of food, and such important articles as [illegible], blankets, cotton clothing, knives, axes, and cooking pots. They are still in a most primitive state. Conservatism [illegible]

The semi-military organisation which has been handed down for their ancestors is still preserved, and continues to act as a deterrent to any innovation. Even that which are useful, the Boers have nothing to escape their prejudice, and it is this fact that has rendered it necessary to consider the possibilities of developing these into useful citizens along a definite line of policy, rather than to adopt merely normal administrative measures, which has been so successful among the other tribes of the Protectorate. Of their own free will the Boers will do nothing except fight with the weapons they have, and the young men of between sixteen and twenty-five years of age have now no occupation of any description. It is on behalf of these youths, the Boers, that the first steps in the necessary policy must be taken. Recommendation [illegible]

It is known that, by their working from their earliest years, the Boers are experts in the handling of stock. Each has been accustomed to herd hundreds of head of cattle since the days when he started to walk, and there is probably no other tribe in the world that can boast such a remarkable of success in this branch of knowledge. But, after consideration and the assumption of the status of service, the youth leaves the care of stock to younger boys and the ability in this direction is thereby wasted. Herding [illegible]

It is said that about fifteen per cent. of the Boers of the Boers who are employed by various farmers in herding cattle but even in this course the value of their services is largely discounted by the aversion which they show to the performance of work which they consider to be derogatory to their dignity, and the limits of what is not undignified are very narrowly confined. Natural labour of any kind is regarded as objectionable, and the Boers are generally incapable of carrying loads. But, if they are given a large high enough to satisfy their vanity, if they are consistently treated, and if they regard the chiefs of their employer's land as suitable, they cannot be improved upon as cattle herds. In Employment [illegible]

In normal times, the number of settlers in the Protectorate who could make use of this class of labour is not large, and the demand for public purposes is equally [illegible] the settlers of the Boers as a tribe in this connection is greatly diminished by their dislike of working for a European whose they do not know, and by the shortness of their constitution, which makes them suitable for work in a restricted area only. In order to make the Boers suitable for general employment even as cattle herds, therefore, it is necessary either to alter their conception of their dignity so as to make their services of more general application, or else to insist on their performing for a smaller remuneration the work that they will consent to do. remainder and return, each to its own area. But the Moita section seems to have flourished above all others and penetrated, during and after the war, into areas which had never before been in its possession.

The details of this period of famine, civil war and European interaction have not been recorded at length, but it is hoped that sufficient has been said to drive home the point that the period 1890 to 1900 was one of great upheaval for the Tenganyika Masai. The most obvious effect of this was the break-up and subjugation of many of the sections, together with the loss of the legislator which held these sections together and generally of political cohesion. Only time can bring about a reorientation in accordance with the present distribution of population.

Another aspect of the above historical review should also be borne in mind. It is almost impossible to find at the present day an elder who did not go through considerable hardship in his youth. To anyone who has lost and regained a possession, such possession is of greater value, at least sentimentally. The Masai of Tenganyika lost their cattle, their mode of living and their tribal life, and largely by their own efforts have once again regained them. It is suggested that their innate conservatism and resentment of change may perhaps be better understood in the light of the foregoing.

175
564

For clarity this historical section is concluded with a chronological chart showing the main events and personalities referred to.

CHRONOLOGICAL CHART.

Age	Approx. date of circumcision.	Important Events.
[illegible]	1770	Members of this age can be remembered by living elders. Sokoi belonged to this age.
[illegible]	1785	Masai penetrated to Usagara.
[illegible]	1800	Conquered Meryawa from Adara.
[illegible]	1815	Took Sukenya from the Kwavi. Kimoio (the original Waarabu) brought up from Arusha Chini. Capture of Engarukwa.
[illegible]	1830	Captured Lolkesa, Molio and Kiboya from Kwavi. Drove Datoga from Ngorongoro Highlands. Mwatan belonged to this age.
[illegible]	1845	One or two members of this age still alive. Took Kwavi from Gerwa. Death of Sokoi.
LAGWEN	1860	Molio Masai called up by Mwatan for Lekipuk war. Capture of Tulamai and Kiboto.
DALALA	1875	Peace made between Masai and Kwavi at Ngoro. Death of Mwatan. Famine, rinderpest and smallpox. Longoo and Sendeyo belonged to this age.
[illegible]	1890	Civil war between Longoo and Sendeyo. First contact with European administration. Parti promoted to this age, though actually Dareto.

FURTHER NOTES ON THE MASAI OF KENYA COLONY.

[With Plates XIII-XV.]

By D. Duncan Fox.

Preface.

The excuse for writing the following is that in the capacity of District Officer, Kenya 114
Colony, I have administered the Kenya Masai for periods aggregating rather more than three years between 1925 and 1930. Being able to speak the language fluently, and having observed their life and habits from day to day, I can supply a certain [121]
amount of information supplementary to the notes recently published in the *Journal* (pp. 185-208) by Mr. Leakey and the earlier work of Sir A. C. Hollis (*The Masai*, by A. C. Hollis, Clarendon Press, 1905). I have avoided repeating facts already recorded by these two authorities except where I can add to them or correct them.

In the following notes the first part consists mainly of additions to and comments 128
on Mr. Leakey's article. Later on, I have dealt with other matters with which I am conversant. By the Masai I mean the people who comprise the territorial 101
sections enumerated in the age-group table below. There are other tribes sometimes called Masai, *i.e.* the Uasin-Gishu, Arusha, Samburu Njempe and Ngurumen, of doubtful origin and divergent customs to whom this article does not refer.

The Masai are a secretive people, suspicious of strangers, and unwilling for the 181
most part to discuss with them their customs. But there live amongst them a number 563
of natives of other tribes such as Kikuyu, who have been adopted by the Masai. Such folk are very ready to expatiate on Masai customs, but their testimony is often misleading because it is only half the truth.

Until recently I had no idea of setting down in writing the facts which I knew 114
about the tribe. I made myself acquainted with their language and customs simply because, without such knowledge, I should have been largely unable to appreciate their point of view or make decisions and give advice of value to them.

As there are many things still to learn about the Masai, I have omitted the matters on which my information is as yet insufficiently verified.

Childhood. Games.—Little girls sometimes play with dolls. These are made 524
crudely by their mothers of mud, which they dries. I have seen a little girl dressing her doll with a bit of cloth, giving it milk from a tiny gourd, suckling it at her breast and rocking it to sleep, just as a European child might do. The Masai name for a doll is *Ee-gwai e-o-mwaj-ap*, which means child of mud. (See Hollis, p. 321.)

/Pages i-iv are title and dedication pages./

/v/ Foreword to the First Edition

121 Advancing culture is more and more rapidly shaping and polishing the customs of the so-called savage peoples. What it takes hold of first and smooths over most thoroughly is precisely what is peculiar to the savage, in which his doings, his thoughts and feelings are most clearly reflected. This is particularly true of those primitive peoples whose customs and views stand in sharp contrast with our principles of civilization and who must start a whole new life if they do not wish to perish. This, of
• [181] course, applies above all to the nomadic peoples, and especially to the militarily disposed among them, such as the Masai. Thus there is ever more urgently approaching us Europeans who live among these peoples the task of completing and perfecting our knowledge about them before it is too late.

Besides this scientific goal, the investigation of the natives of our colonies also pursues a practical purpose. The times during which we forced recognition of German rule with weapons and had to lead the natives, who, through their almost uninterrupted expeditions of war and raiding against one another, devastated the land and reduced the population, to peace by force are almost over. In serious pacifying work they must now be educated toward what, for their own advantages and those of their country, they are to become. Where and how the educator must work, enlightening and advising, to attain this goal, a knowledge of the thoughts and feelings, of the character and customs of the people, will teach him.

In the present study I am presenting only what I was able to
124 establish with certainty. In gathering these contents I observed the principle of letting the people talk freely and only then asking direct questions, when it was a matter of checking the accuracy of what had already been noted. I am convinced that only this procedure -- albeit very time-consuming and hence for the traveling investigator often enough impossible -- can produce results that are uninfluenced by the thinking of the European

M 172 101 /Ewa.71/
in that it was taken as a tribal name, and people spoke of ol oloidi-
lkimai and ol oloidi-Wakuafi. El oloidi (sing. ol oloidoni) means
killers, rough, brutal persons, and is an invective with which the
Wandorobo, Wakuafi, and the Iskimai Ilarikoikia (ol kimoni) designa-
ate their opponent, the Iskimai. Fischer mistakenly translates the
word as "owners of the land"; this, however, would be ollonk ol
[illegible] l ol [illegible].

M 619 189 191 The Wakuafi live in their colonies as more or less peaceful,
sedentary cultivators. Whenever they found peaceful neighbors after
their defeats, they too become calm. On the other hand, where
they remained in close contact with the Iskimai and were exposed
to their constant raids, the old belligerency remained in them. As
example of this is the population of Kenoberg /lit. Iskimai/ in the
Great Aruscha /Arusha/ and Meru areas. In spite of a very con-
M [144] siderable mixture with Wadschagga from nearby Kilimandscharo,
they have completely kept their original character traits. Their
M [448] imperiousness, capacity, and cunning equal that of the Iskimai in
courage, on the other hand, they even surpass them. Their numer-
ous attacks on the camps of Europeans and trade caravans reveal
them as brigands. The relationship between Wakuafi and Iskimai
M 829 is in general not bad. The latter regard the former as fellow villa-
619 [241] gers, even though as inferior ones, because they work the soil
[241] and own only a little livestock. They are foes one minute and
[241] friends the next! And both must always reconcile themselves to
[336] each other, for the Iskimai cannot do without them as suppliers of
[336] vegetable foods, after the rinderpest at the end of the eighties
again raged so destructively among their herds.

D 105 While among the Wakuafi one can still clearly recognize
their one-time power and greatness, this is no longer the case at
all among the Aai. Most of them, just like the El oolti, timidly
and concealed in the bush of the steppes, live in miserable little
grass and leaf huts which can be reached only by hidden paths.
Their food consists of game, which they kill with poisoned arrows
and poisoned javelins, honey, agricultural products which they
obtain in barter, various wild berries, roots, and herbs. Where
they dwell in the vicinity of the Iskimai, they live in a certain

0
105

//Lions//
dependency on them. A caravan crossing across the steppe certainly does not remain hidden from the Wandorobo roaming about everywhere. //10// Their beneficial man cannot is so full victim to the spoils-hungry Maai. Though their poverty and the consequ-
M
[illegible]
ence endeavor to make up for the lack of daughter animals through the killing of game, the Wandorobo, as he man, stand especially low in the estimation of the Maai, yet the latter do not deny the connection with their old fellow citizenses to the extent that they do not grant individual Wandorobo, as well as El Lembus and El molt, admission into their community.

M
101
[illegible]
[illegible]

In recent times these Maai who, after the loss of their livestock, have become detached from the larger community and live in small bands in relative poverty, still generally reckon themselves as belonging to the El donkho, without, however, covering themselves within one of the three branches -- Ank, El ostl, El gnawk. Often they live together with a few Wakwafi, sometimes one also finds one or several Wandorobo families among them. Their property consists of a few cows and donkeys, a couple of goats and sheep. Since they cannot admin on them, they also cultivate maize, beans, etc. here and there and devote themselves to hunting with bow and arrow.

M
[illegible]

The influence that the Maai people exerted and still exert on the settled peoples who live on the borders of the steppes dominated by them for centuries is very great. Just as formerly it was the Wandorobo, now it is the Wakwafi and Maai to whose influence the surrounding peoples most admit. What qualified the Maai for this lordly position is their relatively high cultural
M
• [illegible]
level: what made possible their reaching this position, their strict organization and their war-mindedness. This is not the place to analyze why the culture of the Maai is a higher one than that of individual tribes surrounding them. It should only be pointed out that among almost all of them, in contrast to the former,

000

/[illegible]/
the wives of the Nor'hamitic. Similar ornamental objects of wire are made by the other Ibwari women. The small chains of iron and copper wire are not made by the Ibwari themselves, but are bought ready-made from the caravan people or the nomadic neighboring tribes.

[illegible]

000 Character. — National pride. — Disrespect for foreigners. — Designation of foreigners. — The Ibwari in the service of the Europeans. — Attitude of the Ibwari living among his people toward the Europeans. — The Ibwari toward their land. — Hospitality — Position of the women. — How the Bagre illustrates the character of the Ibwari. — Expression of emotions and other gestures. — Strength of vision. — Ear sense. — Color sense. — Orientation ability. — Song. — Ibwari of beauty of the human body.

[illegible] The main surrounding rock to the character of the Ibwari is their national pride which is based on the religious view that they are the chosen people of God. God created the world and all that is in it only for them. All non-Ibwari are subject to the Ibwari people and their property belongs to them. This explains the haughtiness and the deep disdain toward the nomadic Bagrem, who are not familiar with Ng ai and have no share in the good things created by him and who therefore are condemned to wear their daily food from the soil in the sweat of work. On the other hand, God cares for the Ibwari as for his children, they need not work "[illegible] [illegible] [illegible] work is not good, everything belongs to them anyway, and, since the Bagrem do not give it voluntarily, the Ibwari take it by force. In fact, the Bagre, in the opinion of the Ibwari, only has justification for existence as keeper of the livestock created by Ng ai for the Ibwari.

[illegible] In general the Ibwari designates all non-Ibwari as [illegible] [illegible] [illegible], a term that is to be translated as "unbelievers." /[illegible]/ The Ibwari does not know friendship and loyalty toward the

[illegible]

[illegible] [illegible] [illegible] [

/[illegible]/

As a servant of Kampene the latest to general down the same sweet quality as the members of other tribes from the interior of Sam Adams (1).

> 1. I became acquainted with people of two different tribes of the interior. They are all quite considerably better, though also more inept in the beginning, than the lowcountrymen, converted, and thereby suggestively of the coast.

There is just so little domestic-servant faithfulness and dependability as there is constancy and gratitude for benefits enjoyed. An opportunity to rob the master is happily utilized; in the kitchen, meat, milk, and butter especially disappear. In the pasture the latest herdsman drawn off milk from the cows and blood from the cows and cattle for food the calls of sheep. One time the herdsman came home from the pasture in the evening, quite out of breath, and lamented that an elephant coming in the vicinity of the herd had scattered the cattle by its bellowing. In spite of a diligent search, two head of cattle were apparently lost because of it — two cows, of course! This was indeed very annoying, but was not to be allowed, and I commenced myself /[illegible]/ with ordering the herdsman to stay closer to the cattle with the herd. About eight days later the same incident — assuming — happened, and again it was two of the best cows. If that had gone on, we would have been rid of the entire herd in a few months. The warning had been useless, so the shepherd was given a good thrashing. And behold! From then on not only did the elephants remain away from the herd permanently, but even the cattle that had been disappeared showed up again. He had stolen them and given them to a friend for safekeeping. Another case. A settler had a herd of fine select livestock about two hours from the farm in a secure palisade-kraal and in the care of a number of blacks in his service. A sick had been scratched into the hide of the cattle. One day the herdsman brought a number of cows to the farm with the observation that the sick had grown over and would have to be cut again. The owner did

/[illegible] cont./

179
181
609
[illegible]

He was discovered to his sorrow that the cows had wandered away in the last few weeks to the point of being unmanageable. If he had examined them more closely, he would also have found that they had aged several years in the preceding month. But he had no thought of any dishonesty of the people, whom he considered honorable and good, until when more than 100 of his finest cows had been exchanged for old, worthless ones and he had unmanageably scattered all of the latter. One could cite a whole series of such exploitations for the settler, but here let there be pointed out only one particularly popular trick. When in the evening the livestock of the settler is driven in water, the native herdsmen -- both Maori and Bagrawa -- also like to drive their herds into the vicinity of this watering place. In the pens and lanes of the livestock for the water, there can have the herd of the Europeans, as intended, a few head of the cattle of the Herds, who now, instead of taking his stock out of the storage herd again, marches off with a corresponding number of the settler's best cattle.

179
181
[illegible]
[illegible]
[illegible]

When the Maori servant who regularly invested his savings in cattle has consolidated a small herd, he often enough leaves service in order to return again to his people. If no opportunity presents itself, it may happen that he now serves his compatriots as a spy against his former master. Uncivilized people who live themselves not as boys return to their native heads for circumcision. Live there a few years with their correspondents in the usual manner, and then often go back into service.

179
181
609
[illegible]

The Maori living in the tribe is and remains mistrustful of every European whom he has not because intimately acquainted with through the years. He regards the latter's honesty and forbearance as weakness and believes that it is only because of a lack of strength and cleverness that the Europeans does not oppress him just as he himself does this with the Bagrawa. He performs a service for the European only in order /116/ to have some -- often enough illegal -- benefits from it. If he concludes friendship with him, it is done merely for the sake of appearances and a momentary advantage. As one accused, he almost never confesses, even with guilt proved, but rather, smarts with profound indignation: "A Maori does not do anything like

[illegible]

1. When, after receiving news of an ugly misbehaviour or crime, I spoke to one or another more trustworthy blacks about the unknown culprit, I often heard: It was surely not a black. A black would not do anything like that. Such things do not happen among the blacks.

[illegible]

2. It may be mentioned here that, according to my observation, the industrious and diligenty of the people belonging to the blackbeards caste are decidedly greater than that of the other blacks, so that it seems as if the contempt and bad conscience that the former experience from the latter have bred an industrity of character in the causes of the millionaires.

The mental superiority of the European appears this only in such cases where it has convinced him of some military, while his technical skills seek for too much of the despised "ni kazzi" to the blacks to seem worth notice. It is solely the gun of the Pomeranian Troops that obtain for the white man respect and influence among the blacks and have made this master race of East Africa somewhat more modest.

The picture becomes more gratifying if one observes the blacks in intercourse with his own kind. Indeed all good rules of manners make a good mouth toward the blacks, that is, be good, friendly, sincere toward your fellow villagers.

/[illegible]/

The Ibeno are animated by a deep feeling of solidarity; they stand united against all foreigners. A sincere attachment and love bind the individual members of the family; they vie with one another in order to feed a relative who has fallen into misery. Thus, in 1908, the Ibeno who returned from the Berlin Exposition immediately used the greater part of their savings to buy back relatives who had become slaves during the great livestock epidemic around the year 1900. The tightness in the bond between parents, especially the mother, and children, as well as between brothers and sisters, lessens between married people, where the lively, opposed position of the wife is of more importance.

The men scorn any kind of work. Only singing one is worthy of a man. Large herds of livestock and many wives are his supreme happiness. One who has both enjoys respect and prestige. One looks down on a poor devil. Truly poor people, however, are exceptions, since relatives support one another in gorgeous ways. One who does not have such activity finds accommodations on a rule with one who is well-to-do. He receives food and for that helps the women and children of his benefactor with their work (livestock-tending, house-building, night work for the small livestock, etc.). The condition of /[illegible]/ poverty is also always only of brief duration; the poor man soon acquires some prosperity again through gifts from friends or a share of the spoils of war. Toward friends, one is just as generous as one is good-natured; the hospitality to countrymen, no matter where they come from (with the exception of the Bachenilla, of course), is unlimited. Everyone offers a visitor wherever he happens to have to feed and drink. Everything that the stranger needs or wishes is at his disposal. He reserves for himself a hut for the night by sticking his spear in the ground in front of it; the host then seeks other quarters for the night and leaves house and wife to the guest. If a woman comes for a visit, the wife leaves the hut for the night, so that the stranger may take her place. Hospitality toward other peoples is known only if peace is concluded with them through the ceremony of infant exchange or through blood friendship. The cruelty of the Ibeno is no greater than that of the other black peoples, for example, the Bagoes neighboring the Ibeno. If they

/[illegible]/ [illegible]

given women and children to one, it is not one of companion, but
[illegible] in order to make them useful as slaves, whereas the latest do
not keep such. In general one cannot attribute to them a lasting
[illegible] toward their own kind. The latest only to get
possession the courage enclosed to him. Their extraordinary impu-
dence often makes them appear more courageous than they really
are. Their numerity equals that of most Bali Aldiran tribes. The
wife is at the disposal of every man who belongs to the age class
[illegible] of [illegible] and [illegible] of her husband and mother-law. It is
[illegible]
obvious that, as a result of such conditions and in conjunction with
the pre-vailing polygamy, there can be no question of a proper family
life in the higher sense. For her own husband the woman is espe-
cially the labor force that he needs for household and livestock
management and the means of fulfilling his wish for as many progeny
as possible. Accordingly her treatment depends on how she measures
up to these ends. Moderate beatings are not uncommon, but rough
treatment almost never occurs. In contrast to the men looking
[illegible]
[illegible]
[illegible]

[illegible]

/[illegible]/

[illegible] If we summarize the traits enumerated above, there results, on the one hand, the fact that the character of the island is general reveals the same virtues and vices as that of other primitive peoples, but then also that the island is definitely to be counted among the better half of these peoples.

[illegible] The following little story, which a man from the Kilimandjaro area of Islands once told me, does have the Magnum Glamous the character of the island. "A few many years ago when we still farmed the area with sticks and there hedges and the few opposition were both made bolder and well guarded. One day a couple of our people went into the zoppe to see whether an elephant had fallen into the trap pit made there. There in the bush they found an old, sick island man myself. Full of compassion, they took him home with them, where he gradually recovered. The convalescent moved filled with gratitude and never ceased friendly toward his benefactors when he departed to seek out his kraal again. A few days after his departure the war cry of our people suddenly resounded one night throughout the area. The island had come to make war on us, but by that old man who during his stay here had become familiar with the ways and hyperbe call who owed his life to us."

[illegible] Astonishment, depending on its degree, is expressed by a more or less wide opening of the eyes and the mouth, as well as by a simultaneous raising of the eyebrows.

[illegible] A feeling of disgust is manifested by a darkening of the skin of the face and often also the throat, corresponding to the "blushing" of the white race. In order to express indignation one looks at the other with wide-open, staring eyes often cast downwards. One observes the same in the case of obstinate children.

In reflection the forehead is wrinkled longitudinally and often also transversely in its middle section.

To express ill-humor, depression, anger because of loss, etc., one scratches the head best to one side -- usually to the left -- with the right hand and thereby wrinkles the forehead transversely above the root of the nose.

/[illegible]/

[illegible] In consciousness the eyes sparkle, and there is a happy expression on the face.

[illegible] The subject may often press his lips together tightly. In lying, especially in self-excited lying, the eye consciousness usually exhibits a well-played /[illegible]/ smile and the absence of any trace of consciousness of guilt, which often increases to the point of indignation, as though over an unjust suspicion. The latent shows less a great talent for acting, which he probably has in common with most of the deficient African races. Even when he was himself convicted and has gained the impression that the judge or master is convinced of his guilt, he does not stop lying, but often persists for a long time in the behavior just described. Most rarely his look gradually becomes uncertain, the eyes blink, the skin darkens somewhat, the voice becomes husky and somewhat hoarse and his facial expression says approximately: "Now nothing more will help!"

[illegible] As a sign of contempt one spits before the one held in contempt. More rarely among men, but commonly among women, the same feeling is expressed by pushing out the lips and lower jaw and simultaneously extending the head forward.

The feeling of disgust is manifested by spitting.

[illegible] An extreme degree of fear is shown by a blanching of the skin, especially of the face, trembling of the hands, trembling in the voice, blinking of the eyes, which move outwardly toward the sides, whereby the head either says still or is turned in the direction of the eyebrows.

[illegible] Laughter often increases to a pitch that brings tears to the eyes.

In order to indicate that one is not in a position to do or to prevent something, or to protect oneself or a friend from a loss, to convince someone of the truth of one's words, one drags one's shoulders, turns the elbows inward, spreads the hands out, and opens the palms while raising the eyebrows.

Petulant children make a face as though they intended to start to cry.

[illegible]

/[illegible]/

[illegible] community. Rather, I should call them inferior [illegible] and mention in this connection that the Ainoi, extraordinarily rich [illegible] preserving his health, handsomeness, and physical strength, [illegible] upon himself also moderation in sexual enjoyment.

[illegible] An outstanding people-preserving factor is a strict organization. It can make a small people superior to a larger, less well organized one, and have has given the Ainoi a position of power over the Degusen. A well organized people of the steppe nations on earth grows to little inside by quiet contemplation. Rather, such people are always characterized by a warlike and predatory nature. The racial [illegible] has hereditarily shown all, since it /[illegible]/ dominant great number of men. It has often happened that only half of them who set [illegible] Ainoi, they all of expeditions to which all the warriors were killed. At the beginning of the nineties — in the one example, several thousand Ainoi warriors set out against Uryanoent. They had concluded a few hours to the west of Ainoi /[illegible]/ and had as a guide an Uryanoent man by the name of Degusja, who had lived for a long time among them. During the night before the planned attack, Degusja betrayed it to his countrymen. The Ainoi were repulsed with heavy losses and turned back. Far more than half of them died of hunger and thirst along the way on the twelve- to fourteen-day march. Such mass killing expeditions of war are by no means rarities rather they were constantly in the history of the Ainoi. Certainly the great surplus of women is to be ascribed to them.

[illegible] With regard to the harm that Greenin's epidemics (3)

> 1. The reason that the epidemics were so destructive around 1898 is, first of all, that two epidemics occurred in quick succession: a pulmonary epidemic and dysentery, and, on the other hand, the renewal of the herds by war expeditions was in part made difficult, in part rendered impossible, by the military [illegible].

[illegible]

THE MAORI

Introduction

[illegible] The Maori have been a key factor in the history and family, survival of the primitive grassland ecosystem of Western Australia. Through their fires and livestock they are also one of the principal components of the ecosystem. Although there are substantial settlings on the Maori there have been very few intensive studies. Most settlings are the observations of government officers assigned to Maori as of administration. The general outline of Maori history appears fairly well known, but as Maori many conflicting ideas and completely contra previous behaviorism on these interesting people is present. Existing anthropologists and sociologists have given us detailed and specific descriptions of Maori land use and ways of life. These descriptions often conflicted with one another and often were totally at variance with the conditions we had observed living near the Maori for over two years. It appears to us that there are two basic reasons for this situation.

In the first place, most people who deal with the Maori become strongly partisan about them. There is something of the Lawrencesque "Noble Savage" there about the Maori. They were and are warriors (Fig. 21)

TEXT CONTINUED ON PAGE 97 1

and adopts the customs they carried down at Sant Atlántic. To a large degree they have maintained their own form and of life and they haughtily harbour the concept the atlantics and other villagings of western life. Many people making from coastal and neighbouring countries flocks to a much for whatever and stay in the desert. In the same extreme there this administration is known to Sant Atlántic as Desert-Side.

In the other hand, some administrations who have dwelt with the Desert Find flourishing at Sant Atlántic affirm complete alienant and rejection of foreign ideas. Most of these concerned with land use and management of Sant Atlántic's natural resources see the Desert, like the Arab, as the father of the desert and not the son. The strong feelings between those who "Desert-side" and those who "anti-Desert-side" are sometimes reflected in their reports and publications.

The other factor contributing to confusion about the Desert is the general tendency to regard them as one unified group. Actually there are a number of separate sections of the Desert, some of them pastoral, some agricultural, and some in-between. There are very significant differences in customs involving land use even between adjoining groups of pastoral Desert.

[illegible] occupied by many of the Masai inventoried. Few of these who make the move are entirely living, but the memory of [illegible] to begin alive by the Masai nationalists. The Masai in Kenya's Western Mountains are, as we demonstrated here, those who made the move from Laikipia. They are characteristically more conservative and more distrustful of the government than other groups of Masai, and they attribute these attitudes to the move.

Mulkeratu (1968:11), an admirer of the Masai, attributes the conservatism of the Ilangamuka Masai to their hardships from famine, pestilence, civil war, and German administration in this way:

> It is almost impossible to find at the present day an elder who did not go through unmeasurable hardship in his youth. To anyone who has received repeated a generation, such preparation is of greater value, at least sentimentally. The Masai of Tanganyika lost their cattle, their means of living and their tribal life, and largely the state and efforts have once again required them. It is supported that their extreme conservatism and resentment of change may perhaps be better understood in the light of the foregoing.

During the German period the Masai were largely excluded from the Western Operations in Tanganyika, although occasional raiding parties came through it. Between 1888 and 1895, according to Grant (1967), there was one Masai encampment at Kerrick's barracks

[2.18] Dentric. Many Mosul in the area speak some Dentric, as being Dentric and a limited number of Mosul speak as usually could converse with Mosul throughout the study area. Accidentally we had the services of bilingualism.

[2.3] These Mosul prepare clothing to their country with interest and general acceptance. The acceptance is greatest if they believe the clothing are representatives of the Government. After we had lived or called in Mosul for some months constantly moving from place to place the Mosul appeared to accept us as a harmless, neutral, and accidentally bewildering phenomenon.

Our status with them was helped by our work with grass and animals. Above all else the Mosul appear concerned with animal husbandry. They have a lively interest in wild animals, appreciation for domestic livestock that is almost reverence, and an understanding of the importance of grass. Our work on these things therefore seemed understandable. Beyond the frequent initial query: were we with the Government, there was never any question of why we were working there. The Mosul appear to accept without question that white men are prone to the strangest behavior. Movie companies and some tourists fortify this conviction.

CON

age for Tanganyika.

SAL ABI **Age-set system.** The age-set system is of great importance in the life of a Masai man, since it regulates his conduct toward other men and women and is the basis for the political organization of the tribe. The system is also of significant use in dating past events (Sievekuke, 1954).

SAL ABI Warfare was of great importance in the Masai prior to the 1890's. The whole social organization of the tribe was built around the production and maintenance of an effective fighting force. Although actual fighting is relatively rare now, the customs and social organization remain basically the same.

FET LIS ABI SAL TRI Until the early 1900s the primary duties of a boy are tending livestock (Fig. 9).[1] Roughly every seven years there are a series of ceremonies culminating in a circumcision ceremony. This ceremony is taken by all the young men of the correct age (roughly in their mid teens), and it produces a class of warriors each of whom is known as *el-murani*, or *moran*. This is considered the most important occasion in the life of a Masai man, and from then on he is a full member of the tribe. Each group to be circumcised is given an age

[1] [See p. 53.--Analyst]

*233 232 Hamburg, Germany, but I do not have the reference available. The experiment was outlined by Payne (1961) and part of the results presented by Livingston, Payne and Friend (1962).

If the Masai were indeed good animal husbandmen, it is surprising that they have not discovered this fact in the 400 or more years they have been herding cattle in East Africa. The fact that they apparently *233 232 have not is probably due to their intense conservatism, particularly as it affects their cattle. Evidence such as this points to the deep seated conservatism that antecedes their periods of stress in the end of the last century, to which Fosbrooke (1948) and others have credited present Masai conservatism.

*233 Water supercedes all other considerations in Masai grazing management. In periods of extreme drought the Masai will take their cattle into areas infested with tsetse fly if water is there, preferring to accept some mortality from disease than greater mortality from thirst. The same consideration governs their moving stock into areas where the grazing rights belong to other groups or tribes, or into areas where the danger of wild predators is greatest.

232 <u>Disease</u>: Disease periodically decimated Masai livestock even before the introduction of rinderpest.

CHAPTER 10

Masai Herds and Mara Lions

I

THE Masai have won respect by their contempt for civilization and all that it has offered them. For half a century Europeans have been tempting them with all the material bribes, indeed even non-material ones, for which every Bantu and Nilotic people is avid. There is scarcely an African of the fat lands who would not sell his soul for a school certificate. The Masai have rejected school certificates with a proud and lofty disdain.

Will a certificate fatten a bullock or swell the belly of a cow? Masai hearts are with their cattle; they desire no finer destiny for a son than to walk in the dust of a larger herd than his father's. The young man who dreams of glory sees fine white bulls and brindled cows and green grass knee-high, he does not see the stone bungalow, the shining motor-car, the well-cut suit, the framed diploma so alluring to his darker fellow-countrymen. He likes to wear his hair in matted pigtails smeared with red ochre and rancid butter, to stand with one foot against the other knee, to eat a compound of bullock's blood and curdled milk, to carry his long spear and to keep his women in their beads and coils and fly-infested mud burrow as his ancestors did—those ancestors whose lion head-dresses and painted shields filled the hearts of lesser breeds with terror, and won the right of conquest over the steppes of eastern Africa from their northern Somali deserts to their southern tsetse bush.

For the Masai have pride, and pride is a quality we recoil from in ourselves and half-admire, half-deplore in others. An Englishman today must stamp with the hob-nail boots of equality upon the little shoots of pride that cannot help but spring up in his heart; but when he sees the fine, free growth of it in others, an envious respect attacks him. For

2: Bernardi E, M-4 (no date) 1955 FL12 Masai FL12

Thereupon we infer that the function of the age-unit is primarily social. Its scope is to organise the initiates into a corporate body, separate and distinct from other similar bodies, and to lead them, both as individuals and as a corporate whole, towards a full social and economic independence and towards taking a full share in political life. [150] 561 182

IX – THE CEREMONIES FOR THE INSTITUTION OF THE AGE CLASS

The institution of the age class is brought about by the performance of some special ceremonies, of which the most important is the *ngeherr* proper. Before this takes place, other ceremonies, such as " the slaughtering of the ox with jousting " (*ol geten 1 ol baa*), " the *ngeherr* of milk " and " the *ngeherr* of meat ", must be performed by every initiate. Through these performances the initiate obtains the status of an elder. The *aunoni* is the forerunner of all his age-mates. As was seen, at *Unoto*, he is given the status of an elder, and soon after that he settles down as a married man. 561 [884]

LEAKEY, [151] states that a warrior (i. e. an initiate) who marries cannot have sexual intercourse with his initiated wife. [152] FOX, [153] qualifies LEAKEY's statement and says that such a case " is hypothetical, and does not occur in practice ", because usually the senior initiates marry after the *ngeherr* of milk.

MERKER, [154] is our only authority for " the slaughtering of the ox with jousting ". The ceremony consists in a meat festival offered by the candidate to the elders of the neighbourhood of his father's village. Other initiates share the meat, but eat apart being still under the restrictions of junior initiates. A mock fight follows in which the initiates and women take part. Finally before the sun sets, " a married man with his chief wife comes near to their host and addresses him with the following words ": [539]

[150] Each unit seems to be distinguished from the other by its peculiar songs. FOX, *l. c.*, p. 454, states that almost all of these songs are in a " rather cryptic language ". [533]

[151] LEAKEY, *l. c.*, p. 200.

[152] LEAKEY was somehow misled in his information; he also states *l. c.*, p. 196, that " the actual transfer from the senior warrior stage to the Elder's stage takes place without any ceremonial ", which is not correct. [114]

[153] FOX, *l. c.*, p. 455.

[182]

EDUCATION.—Under the enforced military inactivity, brought about by the Pax Britannica, the Masai were rapidly deteriorating. The continual warfare of former times had developed alertness, powers of concentration, ability for organization, and high intellectual powers. It was necessary to provide a substitute, and he advocated compulsory education. The Masai were not amenable to missionary influence, but he considered that beneficial results would be obtained by the institution of industrial schools, where the better management of stock, the use of the plough, the culture of fodder grasses, and the manufacture of dairy produce might be taught. Such schools would be under Government supervision, and the Masai might be compelled to attend between the ages of eight and twelve.

TRADE.—The Masai being averse to parting with their cattle, trade should be encouraged, and a demand induced, for flour and European articles. Umbrellas, cloth, blankets, tobacco, cooking pots, knives, axes, and other articles were becoming increasingly popular. Itinerant trading, together with the establishment of trading centres, would increase this demand, and it would be beneficial if veterinary restrictions on the movement of stock could be removed.

CONSERVATION OF WATER.—Much could be done to improve the water supply, and the Masai could be instructed to graze their cattle away from the permanent water during the rains.

Mr. McClellan's views.

Mr. McClellan, the Provincial Commissioner, Naivasha, agreed in general with Mr. Hemsted's proposals, but considered one central station to be insufficient for the whole area. The decrease in expenditure anticipated by the establishment of one station only would be counterbalanced by the increased cost of travelling.

Completion of the Masai move.

The Masai move was completed on the 9th of April, 1913, but further consideration of the question of the administration of the Masai was postponed until after his Excellency, Sir Henry Belfield, had completed his prospective tour in the reserve.

Mr. McClellan's Proposals, April, 1913.

In response to a request from headquarters, Mr. McClellan submitted his proposals on the 24th of April. His memorandum followed the lines of that written by Mr. Ainsworth, of the 28th September, 1911 (*vide supra*), but he considered that the reserve should be under the authority of the Provincial Commissioner, Naivasha. There should be two district stations, one in the extended reserve, west of the Uaso Nyiro, at which should be stationed one District Commissioner and two Assistant District Commissioners, and one at Ngong, with one District Commissioner. The former district would include practically all the Masai who had recently moved from Laikipia.

The place of a stock and grazing expert could, he thought, be efficiently filled by the Masai themselves. He considered that game in the reserve would do but little damage, and would leave the better grazing areas for less occupied parts on the arrival of the cattle from Laikipia.

DISPOSAL OF REVENUE.—Mr. McClellan suggested that 25 per cent. of the taxes should be set aside until a fund of Rs. 250,000 had accumulated, when this sum could be placed on deposit for famine relief, the interest being utilised in the improvement of roads in the reserve. In addition, 10 per cent. of revenue could be deducted for use on works, such as schools, roads, and reservoirs. The surpluses on hand at the end of every year, after all sanctioned works had been paid for, should be paid into the Treasury.

TRADE.—Itinerant Kikuyu selling tobacco in the reserve should be discouraged, but itinerant trading by Indians, Somalis, and others might be allowed on permit.

CROWN SETTLEMENT LANDS.—He considered that the Masai should not be allowed with their stock on settlement lands under any conditions, and residence, except in conjunction with employment on European farms should be disallowed. He did not agree with the proposal to create Crown settlement lands for the Masai outside their reserve area, but he considered that, when the time came, a portion of the reserve might be set apart for the settlement of detribalised natives.

SECTION II. THE LAIBON.

NOTE.—*Numbers following names refer to Genealogical Chart.* 128

The aim of this section is to record the functions of the laibon, or Masai Medicine Man, and the Masai attitude to him and his work, to study the character of recent laibonok, and the adaptations they have made under modern conditions, and from an analysis of these factors to consider what place the laibon should take in tribal government. One is apt to lose the main thread of such a thesis in a mass of detail, and for this reason many incidents will be omitted when they only confirm what has already been illustrated by example. Facts which are known to run counter to the general argument are, however, recorded. 791

A. History — recent origins — development — the three types of Medicine man — rules of succession.

The Masai legend of the origin of the laibon is recorded by Hollis. Briefly, a youth, ol-le-Mweiya by name, was found sitting on the top of Ngong Mountain, was adopted by the Laiser clan, and proved himself to be a great medicine man. This occurred about ten generations ago. The only difference between this legend and the one generally current in Kisongo is that Kidongoi (2), shown as the son of the original laibon in the Hollis genealogy, is regarded by most elders as the first laibon. 173 791

One interesting fact arises from the legend, namely that the Masai had penetrated as far as Ngong before they adopted a laibon, thus their original move and occupation of the Kenya Highlands must have been made without the supernatural guidance which the laibon alone can provide. On evidence which need not be recorded here, it seems certain that the Masai, whose age grade custom so closely approaches that of the Galla, were possessed of their present military organisation prior to leaving their original home. Thus it appears that the laibon is a later adaptation imposed on a self-sufficient organisation of government through age grades. Probably much of the confusion of function which exists to-day, the indefinite division of governmental authority between the laibon and the age-set leaders, is due to the adoption of an institution incompatible with the original culture. It would be wrong to regard the institution as being foreign to Masai nature, but it is probably true that it is a feature which had not found its true level in the tribal structure when European influence intervened. 182 791

Assuming that the institution is but recently acquired, its development can be deduced from similar occurrences to-day. For there are, generally speaking, three types of laibon to be found at present. First, there is the private practitioner who, for suitable remuneration, will perform such services as curing sickness, removing barrenness and insuring fidelity in wives. He is only consulted by individual patients. The next stage is when a private practitioner has acquired such a reputation that he is consulted by a deputation on behalf of a group of Masai, and provides charms and lays down a ceremonial to be utilized to the advantage of the whole group. Such practices are alleged to be efficacious for the above-mentioned complaints, and may also prove useful in procuring 791

9:Fosbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

choice resting on the general consent of the tribe. He whom the previous laibon had held in greatest esteem, and trained and nominated for the office, would normally be chosen. The past reputation of the candidate would, however, be a matter for consideration; if someone, other than the deceased's choice, had proved himself extremely powerful, it is possible that he would be chosen, for fear of the consequences were he overlooked. The maxim of English law, that none should benefit by his crime, is also applied. For the death of a laibon is as a matter of course attributed to witchcraft by a fellow Engidong, and the first step in choosing a new laibon is to ascertain who killed the old; such person is automatically barred from succession. 791 [671]

It has been represented that the above theory of late development of the institution stands or falls on a Masai legend. The answer to that is that very few legends are found without some foundation of fact, and secondly that there are many indications that it is a feature not fully assimilated by the Masai organisation. [182]

B. **Pre-European Functions of the Laibon: Raids and War — Age-grade ceremonies (with certain restrictions) — local ceremonies — tribute — supposed administrative actions.**

Immediately prior to his death in 1890 Mbatian was living at Namanga, but had previously lived, as had his father Subet (8), at Lashaine Hill, immediately below the Mondul District Office. He was nominally the official laibon for the whole of the tribe, though his brother Mako lived and practised as a laibon at Engutoto lol Mako, in Ngorongoro Crater. It is also significant that Thomson refers to "the important Lybons (medicine men) Lengobe, Mbaration, and Lembarsacout," without singling out Mbatian as the leader. If he in fact occupied the position, bordering on chieftainship, that many Masai elders would have us believe, it is improbable that even an early traveller would fail to note and comment on it. 791

There can be little doubt that at this time a laibon's chief functions were:

i. Dispensing charms for raids.
ii. Supervising and blessing the age grade ceremonies.
iii. Propounding the ritual and giving charms for local ceremonies, concerned with fertility and disease (both human and bovine) and with rainfall.

It is probable that any acts which he performed in the executive sphere arose from these three main duties, which must now be examined more fully.

In the matter of providing *charms for raids*, it should be noted that raids are divided by the Masai into two types, major (*ol orora*), and minor (*ol wamba*). Both these names also signify a group of moran fitted out for war, the former larger than the latter. A third term, which might well be recorded here is *o remore*, signifying a fight with spears, more particularly the deliberate killing of an alien for the purpose of acquiring a reputation. 726 791 [555]

9:Fosbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

SECTION III: THE AGE GRADE SYSTEM.

A. Basic importance of the system — an age-grade chart — formation of a new age and its ceremonies — endungore — engibata — embolosat.

The importance of the age grade system to the Masai social organisation cannot be over-estimated. It regulates a man's conduct in relation to his fellow men; it is the basis of such political organisation as the tribe possesses: together with clan and kinship it regulates a man's sexual life; organised religion, certain economic activities, and above all military organisation are dependent on the age grade system for their existence. 182 561

In this chapter it is necessary to describe the system and thereafter to examine it in relation to the above-mentioned activities; this presentation has the unfortunate effect of appearing to divide up its manifestations into water-tight compartments. So it must be stressed at the commencement and borne in mind throughout that there is hardly a phase of male activity which is not subordinate to, regulated by, or interlocked with the age grades.

It is not proposed to give full particulars of every ceremony: in some cases these are not known, in others they have been recorded elsewhere. Sufficient detail however must be included to emphasise the theme of this chapter, that the system is all-embracing and that in its various aspects it absorbs a considerable amount of the energies of those participating and is a constant theme of thought and conversation throughout the tribe. 561

A brief outline of the system will enable the ceremonies hereafter mentioned to be appreciated at their true value.

The accompanying chart, dealing with two generations (*olaje*: plur. *ilajijik*) A. and B. each composed of two ages (*ol poror*: plur. *il poror*) *w*, *x*, *y*, and *z*, will, it is hoped, make the overlapping clear. Disregarding their relationship with the previous generation, age *w* is circumcised over a period of four years. Being the first age in the generation they are called *emurata tatene*, the right hand circumcision, but they are none the less junior warriors, i.e. junior to those of the previous generation. After about 7 years they are promoted to senior warriorhood in a ceremony called *eunoto*. About this time, preliminary steps are being taken for the formation of age *x*, which will also enter generation A, as the left hand circumcision, *emurata kedyenye*. About the time when age *x* is demanding promotion to senior warriorhood, some 5 years after their circumcision, age *y* of generation B, once again right hand, will be in process of formation. When *y* have been circumcised, *x* can perform their unoto ceremony, thus becoming senior warriors, but nevertheless remaining left hand. When age *y* is nearing senior warriorhood, and age *z* about to be circumcised, ages *w* and *x* perform the *ol ngeherr* ceremony, whereby they become elders.

From this it will be seen that the right hand circumcision invariably enjoys a longer period of warriorhood than the left, also that the country is never without a standing army of at least one complete age of warriors.

9:Fosbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

561 moran, acting as their guardians and instructors. But after the period devoted to family matters the newly made elders also start thinking about their protégés. Thus, at the moment, the Dwati are responsible for both ages of moran, Kisale and Merisho, yet the Dareto are already engaged in the preliminary ceremonies, *endungore* and *engibata*, of the future moran. This means that under the age grade system, two generations of elders are responsible for two generations of moran for a short time (note overlap on chart). But the elders who shoulder most political responsibility are the *il piron* or guardians of the main body of moran. The matter is by no means clear, but there exist vestiges of a ceremony now practised in conjunction with fertility rites, etc., whereby the senior elders retire and hand over the government to the junior elders.

So it should once more be stressed that after his service as a warrior a Masai does not settle into a dead level of elderhood. The different generations keep themselves aloof in such matters as deputations to the Laibon (though at times they combine) and in the meetings preceding [264] and ceremonies following such deputations. A modern tendency to be noted is that when camped at cattle auctions each generation will cook and eat by itself. It is natural that men of equal age should associate, but the age grade system provides a clear-cut means of providing for this.

561 The following table, compiled in 1939, gives some examples of the distribution of population amongst the then existing age-grade generations. 162 It is probable that there were a few more Nyangusi and Laimer than the table indicates, but that they had been exempt and omitted from the tax-registers which were used as the basis of enquiry.

Distribution of Population by Generations.

		Kibaya.	*Samatwa.*	*Engasumet.*	*Longido.*	*Total.*
Nyangusi	...	1	—	—	—	1
Laimer	...	2	1	—	1	4
Dalala	...	14	12	8	23	57
Dwati	...	58	52	23	26	159
Dareto	...	49	69	38	62	218
Total Elders	...	124	134	69	112	439
Kisale	...	82	123	55	200	460
Merisho	...	41	36	11	34	122
Total Moran	...	123	159	66	234	582
Grand Total	...	247	293	135	346	1021
% Moran to Total	...	49.9	54.3	48.9	67.6	57.0

The two most striking facts that emerge from this table are that more than half the adult male population were at the time moran, and that the Merisho or left hand age formed only a quarter of the moran population.

561 The basic function of the age grade system is doubtless military, 182 and now that the necessity for maintaining a standing army has been removed it might be thought that the early demise of the system is an object to be desired and encouraged. True, modern conditions make

9:Fosbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

many of its features undesirable. The body of young men is largely relieved of economic duties and might be more fully and profitably employed for the benefit of the tribe and the community in general. Further, the process whereby the juniors have to fight the seniors for promotion is wholly bad. Again, the disparity of age between husband and wife is a direct result of the system; a large proportion of unmarried men leads to restlessness on their part; a large number of discontented wives leads to infidelity (even within the wide bounds of the Masai system) on theirs. Thus there is a constant threat to family stability. 561 182

But the system possesses many features of value, which are worthy of retention. It teaches discipline, manners and respect for one's seniors, the passing of which the elders of so many Bantu tribes deplore. Earlier circumcision, which would be one of the first results of any breakdown of the system, would shorten the period now devoted to herding, with consequent upset of the economic system. It would also mean that a full sex life could, with traditional approval, be practised earlier, with consequent detriment to the social organisation. Again, abstinence from tobacco and intoxicants during warriorhood are doubtless advantageous. Finally, the all embracing nature of the institution was stressed at the beginning of this chapter and was illustrated throughout. Its abandonment would, therefore, remove one of the main interests of a Masai's life, remove one of his chief topics of conversation and, unless replaced by an equal interest, lead to reduced vitality in the tribe generally.

What is required, therefore, is obviously adaptation of the system to modern conditions. The most pressing need is fuller occupation for the moran, to replace their previous military exploits. Many ideas, ranging from organised games to road work, have been and are being discussed and tried out with varying success. An alternative or complementary solution lies in shortening the period of warriorhood. This should not be done by later circumcision but by earlier standing down. If each age performed a ngeherr (or retirement) ceremony immediately after their unoto (or promotion) ceremony, they would have served as moran for a period sufficient — perhaps more than sufficient — to gain all the advantages which the age-grade system gives. Such a course would do away with the right and left hand ages in each generation. Each age would be a generation in itself, thus reducing the incidence of inter-age disputes. It would also mean that all moran would serve for an equal period and not involve the right hand age in 15 or more years' service. The Masai can adapt their organisation when conditions demand. For instance the right and left hand ages of the Dalala generation performed separate ngeherr ceremonies. The Dwati and Dareto generations were composed of right hand ages only. If such changes were possible in the past, they can and must be made at present, since the necessity for adaptation is even more imperative. 561

But retirement to elderhood involves more than the ritual act now practised at the ngeherr ceremony. It means a complete change of outlook brought about by the assumption of responsibilty in family and economic matters. In other words it involves a psychological rather than a ceremonal

13:Huntingford E-4 (no date) 1953 FL12 Masai FL12

The members of each *ol-porror* are circumcised in batches. Each batch forms an associating group throughout Masailand (like the *mat* of the Nandi), and has a permanent name which recurs in each age-set, and in each succeeding age-set. There are four such groups in the Right Hand; they are called *Il-cagen-opir*, "the big ostrich feathers," senior;[55] *Il-parigotua lay*, "our swift runners"; *Il-hirimboi* (meaning unknown); and *Il-tareto*, "the helpers," junior. The Left Hand, being smaller, has, according to Fosbrooke, only the last three of these groups. Women have no age-sets, but are considered to belong to the *ol-porror* which was in formation at the time when they were circumcised. 561 [562]

The main function of the age-sets was to provide a permanent source of man-power for fighting, and through them are still taught discipline and respect for elders; they thus affect behaviour patterns. An attitude of respect is required of junior to senior age-sets, while between members of the same set there is a relationship of equality and a sense of solidarity in their relations with other sets. Membership of a set also involves restrictions on both pre-marital and marital relations, of which mention has already been made. In the old days, the duties of warriors were chiefly to raid, in order to maintain as well as to increase the numbers of cattle; and to defend the country. Warriors were not allowed to drink intoxicants, but they had a number of privileges, which included access to the unmarried girls, and the right to demand milk at any homestead, and to oxen for eating. Though officially their fighting duties have been replaced by certain aspects of cattle management, mainly watering and night herding, there is a constant tendency in some tribal sections to raid their neighbours. [182] 561 701

Clans

Clans (*in-kishomin*, sing. *en-kishomi*) are divided into sub-clans or primary divisions, *il-gilat*, sing. *ol-gilata*. They are dispersed throughout Masailand, among all the tribes (*il-oshon*), and are totemic and patrilineal.[56] It is not certain how many clans there are, and this uncertainty seems to exist among the Masai themselves. The exogamous unit is probably the *ol-gilata*, though Tombo ole Mbaei says that 614

000 The East African steppes as habitation area of the Masai people. -- Their immigration in three corps. -- Their battles. -- Division and distribution of the land among Masai, Wakuafi, Wandorobo and their attitude toward one another. -- Influence of the Masai people on the sedentary tribes. -- Mixture with Negroes. -- The somatic characteristics of the three branches of the Masai people show their racial connections, the ethnographic ones their social connections.

131 Between the 34th and the 38th degree of longitude and the 3rd degree north and the 7th degree south latitude, in German and British East Africa, we find large steppes, which are often designated as the Masai steppes after their inhabitants. They are bounded by hilly lands that are mostly thinly populated, especially by sedentary Negro tribes, and are more or less well cultivated.
133 The terrain formation of the steppes is sometimes flat, sometimes undulating or rolling, sometimes hilly and, in this case, usually determined by volcanic activity. This stands out especially drastically on the Kenia /Mt. Kenya/, Kilimandscharo /Kilimanjaro/, Meru, and Ol Donjo l'Eng ai, on the latter of which, for example, on a narrowly circumscribed space /6/ between the steep slope of the Mutiek Plateau, the Gilef and Timbati mountains, hill follows hill and almost every one bears or conceals the ruin of a crater, a landscape such as we are familiar with from photographs of the moon.

13 The extent of the steppes, in connection with the existing amount of precipitation and water sites, made them a more than
• [182] adequate region for a stock-raising nomadic people. The very saliferous soil produces excellent fodder grasses and provides salt licks in countless places.

17 As far back as the history, the memory and tradition of the
131 people of these regions extend, and certainly still many, many centuries longer, these steppes were, and are up to the present
174 day, the arena of the Masai people. On the migration, or, more accurately, slow push, they came from the north, out of the

/103 cont./

619 After a battle of the Masai among themselves, the conclusion of
728 peace is that the speakers, in the presence of a number of warriors of both parties, exchange their skin capes and sandal thongs. This is called etabaschage megitin = exchange of skin capes.

726 The length of the stretches covered on war expeditions, in com-
701 parison to that of their neighbors carrying on agriculture, is often
484 astonishing. Performances of 60 to 80 kilometers a day, three or four days in succession, are by no means exceptions. If one considers,
[702] however, that the training of warriors consist only of marching, that,
[276] aside from their weapons, they carry nothing heavy, and before their marches, as well as during them, they partake copiously of stimulants, their performances in no way exceed those of a German infantry
701 troop. The tales of the caravan people relate miraculous things about
• 182 the speed and endurance of the Masai warriors, and even European
147 travelers have contributed to the spread of this legend in that they compare the physical performances of the Masai with those of the
271 Europeans in the tropics. The untenableness of such a comparison is obvious. One also often hears how the Masai are admired for their alleged ability to be able to give up the drinking of water on their marches. Presumably this rumor arose from the fact that these people, in contrast to other tribes, never carry a gourd bottle of water on their
701 long migrations. The Masai, however, knows perfectly every little
182 spot of the steppes, he knows every rocky basin, every tiny spring,
271 he also knows where an apparently dry brook bed carries subterranean
[823] water. Where water has collected in old hollow trees, and especially in baobabs, this is accessible to him through a series of steps made
[824] out of foot-long taps bored in horizontally. Finally, there are a number of water-rich roots and tubers, which, chewed, are very well suited
701 by their water content to quench thirst. They serve him, /104/ just as
182 the wild honey, not infrequent in the steps, also serves as food on the
222 march. A cuckoo bird, the honey indicator (Cuculus indicator, called
[825] eñ johoroi by the Masai), leads the Masai to the concealed honey holes.
[136] As soon as it sees human beings it calls with a strident sound and then flies slowly to the nearest honey place, to which the people follow it
[825] in order to take out the honey. If the amount found is still not sufficient for the warriors, they bury the chewed comb, whereupon the bird, after

701 /104 cont./
• 182 a little while, will then lead them farther. Otherwise they leave it
222 the rest.
[825] When the warriors of an ol boror notice that their bones are
701 getting old and the el barnot surpass them in strength, they agree
561 that it is now time to think of marriage. After they have obtained
582 the permission of the speaker and then that of the chief, one after the other leaves the warrior association, each one shortly before his
701 wedding. He announces his retirement by means of a feast, the ol
561 geteñ l ol bãã, that is, ox slaughtering with a tournament. To this
574 all the inhabitants of the nearest kraals are invited and are shown hospitality with the meat of one or several head of cattle. As soon as these are killed, each warrior cuts off a piece of meat for himself and devours it behind a bush standing somewhat apart. Then each of those present receives his share, while the remainder is strung on sticks two meters high. For these the warriors fight with the girls and women in a game in which the latter vigorously swing the sticks, before which the former has more fear than the women, somewhat
[526] accustomed to beatings. Then the younger ones amuse themselves and play, for instance, tag (tosudja). Before there is thought of de-
[539] parture, about five o'clock in the afternoon, a married man and his principal wife go to the host and make the following speech: "adjogi megur' ira ol morĩni dada it' ol móruo, iñora ñ gischu inonu, ñ gera inonu, iñora naleñ, tabala 'mbaa el móran, ida tada ol móruo, tabala n dogitin bãgin el móran, ida tada ol móruo"; in translation: I say, you are no longer Ol morĩni, but Ol móruo, take care of your cattle and your goats and sheep and watch over them well, leave the occupation of the warriors, now you are ol móruo, refrain from all things of the warriors, now you are ol móruo.

701 After this feast it is up to the warrior whether he takes part more
561 or less regularly in the expeditions of war. As a rule he soon marries
[582] and lives with his wife either in the father's kraal or in the warrior kraal until all his contemporaries are married. Only then are they
[591] considered ol móruo; each one builds his own kraal and removes clothing, ornaments, and braid of the warriors. He is now at the end
[145] of the twenties, his best strength has been spent. In general the Masai, just like all members of the black race, spend their lives very quickly, they age early, without ever attaining a really advanced age.

/344 cont./

IV.

000 The future of the Masai People. -- Weighing the effect of the people-preserving and people-destroying factors. -- Polygamy. -- Nutrition. -- Fertility. -- Child mortality. -- Free love. -- Organization. -- Wars. -- Epidemics. -- National pride. -- Clash of the culture of the Masai with that of the Europeans. -- The incompatability of the two hurts the Masai. -- Harmful consequences of the impoverishment. -- Difficulty of becoming sedentary.

121 In order to make a prognosis about the future of the Masai people it seems necessary, first of all, to weigh the people-preserving and people-destroying factors established in the people, in its character and customs, and then to observe the phenomena that appear when the Masai meet the Europeans. We have many examples of the fact
• 182 that polygamy does not promote an increase in the population to the
595 extent that monogamy does as a rule. As the reason for this phenomenon one finds an accumulation of wives in the hands of the wealthy, and, as a consequence of that, celibacy for lack of women among very many of the less well-to-do and among the poor. It is obvious that under such circumstances polygamy leaves very many women
[162] neglected. But it is different among the Masai, for here there is such a surplus of women -- perhaps in part again as a result of polygamy -- that no man remains celibate, in fact the possession of only one woman is an exception. Hand in hand with this goes the not so
[735] unequal distribution of property; in practice there are scarcely any poor people. Another reason to which /345/ the decline in population among many polygamous peoples is attributed is that polygamous marriages as a rule are relatively poorer in children then monogamous
[842] ones. This objection is not to be taken into consideration here either, for we have seen that the fertility of the Masai women is very great. Yet, in order fully to consider the polygamy of the Masai in its economic effect, we must observe the milieu in which it exists. The polygamous household of the Masai may be compared to a stock company, to which the property, theoretically belonging solely to the house father belongs in practice. The house father is the chief

/345 cont./

182 shareholder, the rest of the shares are in the hands of his wives, who
595 acquire these shares through the birth of a son. Through this the wives, who have the duty to tend and care for the livestock, are interested in the preservation of the property in the most extensive way. This is the one factor of the polygamy of the Masai promoting prosperity with all its advantages for the political economy. The other lies in the fact that many women give birth to more sons for one man than one woman could. Here, however, male offspring are augmenters of the paternal property. The boy grows up to become a warrior and brings his family the spoils of the numerous raids, through which not only is the herd increased, but, through the supply of new blood, is also improved.

Polygamy among the Masai is therefore a natural institution. Without it large masses of women would be deprived of their natural occupation, a condition that seems impossible for a primitive people. It is, moreover, a source of prosperity, which, among a culture-poor nomadic people, can only make itself felt favorably for their preser-
[146] vation as a people. From it follows, first of all, good nutrition, which makes the body resistant to the effects of illnesses. It corre-
[165] sponds to my observations that among the Masai in general, among
[164] adults, fewer cases of death occur as a consequence of illness than is the case among the Negroes living in their vicinity. Also, serious illnesses are more infrequent among them than among the former
182 and are milder in their course. The circumstance that abortion is
847 practiced by the women in only very rare exceptional cases also undoubtedly acts to promote health. One can sufficiently observe the harm that this bad custom has often caused primitive peoples among the various neighbors of the Masai, though indeed there are also exceptions to this. Thus, I met a number of Dschagga women who went through this operation four to six times and allegedly, as well as apparently, without harm.

182 In contrast to the high fertility there is also a rather high child
165 mortality, though infanticide is entirely unknown. It is definitely
854 beneficial for the child that through work the mother is not kept
[847] outside the kraal, but can always remain in the vicinity of the child.
[853] The long nursing period of about two years is also advantageous.

/345 cont./

182 Harmful to the child's health, on the other hand, are the poor huts,
165 which are always /346/ filled with dense smoke, and furthermore
854 the lack of cleanliness and the faulty diet. The belief, widespread
[362] among all African primitive peoples, that fat gives strength and
[853] health leads to the stuffing of the baby, despite all its struggles and
[146] screams, with unbelievable quantities of butter. Soor, as well as
[856] stomach and intestinal affections, and ailments of the respiratory
[164] organs are therefore also the principal illnesses that carry off the babies. If one compares the high mortality among children with the very low one in later life, and if one further considers that, in inspecting the Masai kraals, one finds almost only healthy people full of energy, one cannot resist the thought that the treatment of the children, especially the babies, unconsciously aims at culling out all the weak elements at an early age and preserving for the people only the most vigorous ones that are equal to the demands of life. Seen from this standpoint, that of natural selection, the high child mortality seems less unfortunate. Finally, the late age
182 at which the men enter their first marriage is unfavorable for popu-
582 lation increase. Until about the 28th or 30th year of life the Masai
836 belongs to the warrior standing, and he may marry only after leaving
837 it. This circumstance in turn makes free love, such as exists in the warrior kraals, an understandable social institution. One must judge this arrangement on the soil in which it grows, in order to remain objective. From the same standpoint we shall have to judge more leniently the free love existing among the married, which, despite numerous restrictions, appears to us like a continuous prostitution
[548] of the woman. One can do this all the more since through that professional prostitution is excluded here, and consequently the possibility of infection is greatly reduced; this last circumstance is undoubtedly to be regarded as people-preserving. Actually the Masai
[164] maintain that in former times (before the great livestock epidemics) venereal diseases only very rarely occurred. Immorality is rightly
182 regarded as a people-destroying factor, and history teaches us by
831 many examples how licentious and refined sensuality was one of the grounds that caused the decline of higher peoples. Here among the Masai, however, it is not a matter of this unnatural kind of

/346 cont./

182 immorality. Rather, I should call their behavior animalistic-natural
831 and mention in this connection that the Masai, extraordinarily vain
[181] about preserving his youth, handsomeness, and physical strength,
imposes upon himself wise moderation in sexual enjoyment.

182 An outstanding people-preserving factor is a strict organization.
721 It can make a small people superior to a larger, less well organized
one, and here has given the Masai a position of power over the Negroes.
A well organized people of the steppes nowhere on earth grazes its
[181] little lambs in quiet contemplation. Rather, such people are always
characterized by a warlike and predatory nature. War makes itself
felt here harmfully above all, since it /347/ devours great masses
of men. It has often happened that only half of those who set out
returned; indeed, they tell of expeditions in which all the warriors
were killed. At the beginning of the nineties -- to cite one example,
several thousand Masai warriors set out against Unyamwesi. They had
assembled a few hours to the west of Meruberg /Mt. Meru/ and had
as a guide an Unyamwesi man by the name of Degénja, who had lived
for a long time among them. During the night before the planned
attack, Degénja betrayed it to his countrymen. The Masai were
repulsed with heavy losses and turned back. Far more than half
of them died of hunger and thirst along the way on the twelve- to
fourteen-day march. Such man killing expeditions of war are by
no means rarities; rather they recur constantly in the history of the
Masai. Certainly the great surplus of women is to be ascribed to
them.

182 With regard to the harm that livestock epidemics (1)
731
233

> 1. The reason that the epidemics were so destructive around 1890 is, first of all, that two epidemics occurred in quick succession: a pulmonary epidemic and rinderpest, and, on the other hand, the renewal of the herds by war expeditions was in part made difficult, in part rendered impossible, by the military stations.

/347 cont./

182 caused the Masai people in the period before the occupation of the
731 country by Europeans. I have no reliable observations made by myself
233 or by Europeans. Such can scarcely exist, for at that time the Masai were a feared power that every caravan liked to avoid. I am therefore relying on the statements of old men. According to their recollection, the epidemics were never capable of producing actual famine. As soon as the beginning of an epidemic was observed, the Masai fled in wild flight with the herds, leaving the sick animals lying along the way. Half the herd at most is supposed to have succumbed. If one considers the size of the herds at that time, one understands that the surviving part could always still furnish sufficient milk and meat.
[721] Furthermore, the war expeditions soon brought substitutes for the fallen animals and thus acted to preserve prosperity (2).

> 2. It is to be inserted here that empirically livestock epidemics caused few losses for the sedentary Negro practicing animal husbandry along with agriculture. This is probably chiefly due to the fact that he calls only very few head his own and keeps these in his hut, which is far from the next one. Though that the Masai were able to replenish their depleted herds quickly and easily.

182 Finally, the Masai's profound contempt for the surrounding Negro
186 tribes was also favorable for the preservation of the people. It kept the people free of foreign elements, which here would only have resulted in a degeneration of the race.

121 The fable that primitive peoples would have continued to develop
177 peacefully and favorably if Europeans, with their corruption, had not disturbingly interfered has long been recognized as such. On the other hand, however, it remains an /348/ undeniable fact that these peoples decline upon contact with the higher culture, and that many even disappear as a people. The reason for this phenomenon lies in the fact that these peoples have already been living on an unhealthy basis and have owed their preservation to means that we designate as

/348 cont./

121 illegal and immoral, because they run contrary to our consciousness
177 of justice and our Christian morality, and which cause to arise in the economic field exploitation in the crassest sense of the word. Now while every state that occupies a savage country has the duty to appear as promoter and guardian of justice and morality and at the same time to promote economic development by guiding production along the paths of our modern principles, along with that it only too often overturns the foundation pillars on which the existence of a primitive people rests.

182 Thus in plague-ridden Africa the Masai largely owe their existence
721 as a nomadic people, whose only resource lies in its livestock holdings,
178 to the fact that they can always replace their losses by expeditions of war and plunder. As soon as the possibility of such expeditions is taken away from them, or at least very much reduced, through the erection
[648] of military stations that grant protection to the victims of the Masai, there must naturally arise a situation in which a gradually increasing weakening of the vitality of a people takes place. What was formerly to their advantage, their war lust and the cowardice of the Negroes, now becomes fatal for them. Both entice them to raiding expeditions again and again. In order to avoid the punishment deserved for that,
[361] they retreat into regions that they formerly avoided as harmful to the health for human beings and livestock, or on account of inferior
177 pastures. If the Masai, when they came under the influence of the
182 European occupation, had still been the strong people of Mbatyan of 30 years ago, they might perhaps, after the example of other primitive peoples, have carried from it even though a marked, nevertheless only a temporary weakening in the meeting with the higher culture, and then gradually recovered again when they had become ready for its advantages. But we found the Masai already in a condition that
182 looked very much like ruin. The livestock epidemics around the
931 year 1890, which, not locally restricted, had afflicted the herds of all the Masai to such an extent that actually only miserable remnants were left, had produced a general and extraordinarily sever famine. Hundreds of thousands of Masai, especially men and boys, fell victim to it, and in the year 1895 the author still found the steppes around Kilimandscharo appearing in places as though they

/348 cont./

182 731 had been sown with the bleaching skulls of those who had starved and out of the stricken animals. Any of the women and girls who had not died of hunger sought and found refuge among Negroes practicing [648] agriculture, who always like to buy or kidnap female individuals. A mother would sell her child for a handful of maize and would sell herself a day later for a similar price, in order to avoid starvation. Negroes and caravans /349/ took possession of the will-less ones, in order to resell them as slaves. Many have since come back, in part through flight, in part through redemption by their relatives, but more are still found in strange hands. The latter, even though their blood lives on beneficially in the new mixture with Negroes, are 182 731 669 permanently lost to the Masai people. So greatly has the misfortune, to which an opposite effect is so often attributed, broken up the former organization, the firm unity, that, soon after the end of the epidemics, the unhappy quarrel between the brothers Lenana-Zendeo about the undivided rule over the Masai could begin. With its continuing civil wars it acts powerfully toward the completion of the destructive work of the epidemics. The Negroes, with whom alone [726] [186] the Masai formerly waged war, except for smaller undertakings among themselves, which bore more the character of provocations than of serious battles, were opponents inferior to them. Now equal parties stand opposite each other, which makes the wars bloodier, more destructive.

178 241 Through increasing impoverishment as a result of these epidemics and civil wars, there is now going on among the Masai -- as formerly among the Wakuafi -- a change from nomadism to sedentation, [433] agriculture is taking the place of animal husbandry. The ones [361] deserting the "people" in this manner are founding settlements, in part self-sufficient, in part supported by Negro tribes, somewhat removed from the dry steppes, there where the watering is adequate for the laying out of plantings. No one expects them to prove to be particularly skillful at this; but Nature, which goes so far to meet her children in the tropics, helps here too. A moderate watering suffices to make the batata shoot stuck in the virgin soil grow and produce tubers. Maize for the most part appears just as easily satisfied as advantageous. These then are the principal useful plants

/349 cont./

178 that are started with as a rule and which one therefore finds in all the
241 settlements. Yet despite the ease of production of the field crops,
the transition to agriculture nevertheless is taking place in a way
178 that is reducing the population in extraordinary fashion. First of all,
• 182 the acclimatization process slowly being accomplished demands a
164 great sacrifice of human lives. The Masai, little afflicted with
165 fever in the dry steppes, suffers with it quite seriously in the moist
regions in which mosquitoes are permanently at home. Thus on two
occasions in the same new settlement I found all the adults and many
children sick with fever. Another one had just been abandoned by
its inhabitants, leaving the sick behind. The ones left behind,
principally men and boys, were badly reduced by fever and, in
addition, suffered to a great extent from virulent leg ulcers, whose
great extent -- in many cases they covered the entire lower leg,
from knee to ankle -- probably is to be traced back to a general
weakening of the body by fever and lack of food; for such ulcers
are not common among nomadic Masai, and, where they occur,
/350/ they remain smaller and show a tendency to heal rapidly.
Other illnesses arise from the unfamiliar diet. The rapid transition
[262] from an almost pure meat diet to an almost pure vegetable diet
makes demands on the stomach and intestines that a body weakened
by fever is seldom equal to. Sickness and death from this cause
are frequent and are increased further by the consumption of bad
water. Thus, more than half the people in one settlement com-
plained of painful diarrhea and bloody stools. All these acclimati-
[842] zation illnesses seem also to manifest their effect in decreased
[163] fertility of the women and increased child mortality. I was repeat-
edly struck by the small number of sucklings (two-year suckling
period) and older children. Thus early in 1902 in Ngaruka, between
Lake Manyara and Lake Natron, among a number of about 50 women,
I found only twelve children, three of them babies. According to
the statements of the parents, very many children had died of various
ailments, especially fever, stomach and intestinal affections, several
178 also had perished in Masai attacks. For the Masai who are becoming
619 sedentary, the ones still living among the "people" as nomads are
721 a scourge that scarcely falls short of the illnesses just mentioned in

/350 cont./

178 its effect. Hated as faithless and despised as agriculturalists, the
619 sedentary ones are constantly plagued by raids that not only cause
72 them great loss in human lives, but also take away any possibility
[829] for them to arrive at any improvement in their way of life by keeping
livestock for the attainment of the meat and milk diet so necessary
[177] for them. Moreover, the frequent intercourse with sedentary Negroes
[164] and caravan people leads to an increase in the cases of venereal
582 diseases. Premature marriages of girls, which can not happen among
178 the Masai still living as nomads, is not rare among the sedentary
184 ones and often enough leads to the death of the young woman who
165 is scarcely more than a child and whose bony structure, despite her
attained capability to conceive, is not yet developed. Finally, it
178 must still be mentioned that no doubt the longing for the formerly
182 free life in the broad steppes and the feeling of humiliation over
having become a so deeply despised cultivator of the soil oneself
[186] are factors that have a wasting effect. The latter circumstance also
[177] brings with it a decrease of national pride. The barrier that kept
[144] Negroes out of the community of the Masai has fallen. A disadvantageous race mixture hurting the people is slowly taking place.
[648] Among the Wakuafi this process was more rapid in their period. At
[721] that time no European administration prevented their raiding expeditions in Negro regions, from which they brought home livestock
and women experienced in agriculture.

177 In frequent -- almost daily -- intercourse that soon springs up
178 and then continues to exist between the Masai who have become
sedentary and the settled Negroes, the Masai naturally also share
in the disadvantages that /351/ come to the Negroes through the
encounter of their lower culture with our higher one.

178 We have seen how many difficulties sedentation brings to the
177 Masai, and it is therefore not surprising that a part of those who
361 have already become sedentary give up their fixed residences again
after repeated failures. These then often join the Wandorobo, to
live by hunting, and call themselves this.

*132 Allowing a three degree F. average temperature decrease for each 1,000 feet rise in elevation above sea level (Heady, 1960), much of Eastern Masailand would have up to six degrees F. higher average annual temperatures than Western Masailand. Over the greater part of both areas the mean annual rainfall is similar, with Western Masailand receiving roughly 30 inches while Eastern Masailand probably receives some 25 inches (Met. Dept., 1959).

*13 184 • 182 Except for the Rift floor, the vegetation types and communities in both areas appear to have been much the same (Edwards, 1951:32; Edwards and Bogdan, 1951:3; Heady, 1960:12, et. seq. and his appended map of Grasslands and Potential Grassland Types). However, Eastern Masailand with lower rainfall and higher temperatures would be more vulnerable than the western area to desiccation through human activities, especially overgrazing, overburning, and diversion of water supplies.

As noted above, Western Masailand has been little affected by recent changes in human activity. On the other hand, Eastern Masailand has been intensively modified in the past fifty years or so. Much of Eastern Masailand is easily accessible by road and railway. Nairobi, capital of Kenya, lies at the northern end of Eastern Masailand. Nairobi was started in 1899

*13 as a base camp for construction of the Uganda railway.
* 182 Today it is a modern city of about 250,000 people.
184 Spreading south and east from the city along the edge of Masailand are fenced ranches and farms. The Great North (Cape to Cairo) Road runs dustily through Eastern Masailand. Arusha, virtually surrounded by Masailand in northern Tanganyika, is a provincial capital and the center of a flourishing farming district. The provincial headquarters for the Masai Administration in both Tanganyika and Kenya are situated in Eastern Masailand.

The Masai living east of the Rift are from different sections of the tribe than those living to the west, and they are significantly less conservative. Consequently Eastern Masailand has received more ranching schemes, water holes and other projects to "improve" their livestock grazing than Western Masailand, and therefore Eastern Masailand is far more seriously overgrazed. Over much of the area vegetation is impoverished and surface conditions show severe desiccation.

12 It is difficult to obtain quantitative data on
*13 the numerical increase in livestock or its impact on
*233 the vegetation, since such data from earlier years are not generally available. One area where such data

12
*13
*233

are available will serve as an example.

12
*13
175
*233

Passing north from Arusha, the Great North Road skirts Mt. Meru, then crosses about 40 miles of fairly level land before passing Longido Hill, 14 miles south of the Kenya border. In German times (prior to 1918) the land from here westward into the Great Rift was maintained as a game reserve and Masai were excluded. From the descriptions of East African residents who visited the area during and just after the 1914-1918 war, and from the description and vegetation map of Jaeger (1913) this area was open perennial Themeda grassland, with good grass cover and abundant wildlife.

The British took over Tanganyika as a Trust Territory after World War I, and in the 1920's they opened the reserve to the Masai. For a time the Masai had moderate numbers of livestock, grazed seasonally in the area along with the wild ungulates. Then a series of water points were provided, using bore holes and piping water into the grassland from springs on nearby wooded mountains. This water allowed the Masai to keep their cattle year-long in areas formerly used only seasonally, with the result that most of the area has been devastated. The Themeda with the rest of the perennial grass cover is gone. The soil is gone, leaving

12
*13
*233
• 182

12 erosion pan and blowing sand and dust. Thorn bush has
*13 invaded the area and the aspect at present is of an open
*233 thorn bush wasteland with virtually no herbaceous ground
• 182 cover. One vestige of the former grassland remains. At mile 29 from Arusha, the road passes through a roughly half mile wide strip of open perennial grassland. This is the bottom end of a European ranch where grazing has been strictly controlled.

*13 The grazing-induced devastation seen in the
182 above example is repeated, in greater or lesser degree,
*233 throughout Eastern Masailand.

The wildlife in Eastern Masailand has been severely affected by this recent land abuse. Diversion of water to the Masai water points has denied the wild animals many of the sources of water they previously relied upon during the dry seasons. Of the seven or eight major dry season water supplies that existed in Eastern Masailand in Tanganyika, less than 20 years ago, only two remain at present (Talbot, Talbot, and Lamprey, 1961). Overgrazing by domestic livestock has altered or removed the grass cover which provided much of the food supply for the wild ungulates. The overgrazing-induced change from grassland to thorn scrub rendered much of the habitat unsuitable for the open

*13 *182 *233 [417] grassland species. Fences have further restricted the movements of the migratory species.

The impact of recent land use changes on wildlife in Eastern Masailand can be illustrated by the wild ungulates of the Athi-Kapiti Plains. This Themeda grassland lies immediately south of Nairobi, in Kenya's Eastern Masailand. Fifty years ago, in terms of climate, soil, vegetation, elevation, and animal life, this area was virtually identical with Western Masailand, 60 miles airline to the west. Here, as in Western Masailand, the wildebeests are considered the key ungulate species, and they will serve as an example:

*136 Until about 1927 the wildebeest population spent the wet seasons on the Athi-Kapiti Plains and in dry seasons moved north, east, and south (Kenya Game Dept., 1908-1914, 1920-1921, 1925, 1927; Percival, 1928; Simon, 1962). From the above references and discussions with local residents and game authorities, especially the Hon. M.H. Cowie, Director of the Royal National Parks of Kenya, Mr. S.I. Ellis, Warden of Nairobi National Park, and Captain D.R.P. Zaphiro, Game Warden of Kajiado District, the wildebeest populations and movements in Kenya east of the Mara, area, prior to the 1920's appears to have been as follows: There probably were two main populations: one centered on the

*136 In times of stress some zebras have been noted making such a movement (Kenya Game Dept., 1962), but we have no recent evidence of any such moves by wildebeests.

The population of wildebeests on the Athi-Kapiti Plains apparently had access to all of the area occupied by wildebeests in Kenya east of the Rift, and they may have moved south into Tanganyika. The southern part of this area, however, was only visited in times of drought. The normal non-drought range for these animals probably covered roughly 3,400 square miles. The present range is only some 28 per cent of the former range. It represents the former wet season range for the wildebeests. With the exception of the watercourses in Nairobi National Park and part of the Athi River, there are no dry season water supplies or grazing grounds left accessible to the Athi-Kapiti wildebeests.

*136
• 182 According to Game Warden Zaphiro, the population of wildebeests in the southern area now appears less than that of the Athi-Kapiti Plains. Severe overgrazing by domestic livestock and diversion of water have rendered much of the area unsuitable for wildebeest habitat. Since the early 1900's, much of the area on both sides of the border that was open perennial grassland has been turned to near desert or waterless, sandy, thorn scrub

*186 (Talbot, Talbot, and Lamprey, 1961).
• 182

The wildebeests in Western Masailand represent a population under essentially undisturbed conditions while those in Eastern Masailand are a population surviving under conditions much altered in the past half century. As described below this situation appears reflected in differences between the two populations, especially in population dynamics and behavior. Comparison of the data in this report and Talbot and Talbot, 1963b with the results of ecological studies in Eastern Masailand could yield significant information on the differences between disturbed and undisturbed grassland ungulates.

The area occupied by these wildebeests is about 950 square miles. It is now considered a closed habitat for the wildebeests (Zaphiro, 1959) being bounded by the Rift wall in the west, bush country and grazing schemes to the south, hills, fenced farms and the city of Nairobi on the east and north. Therefore the wildebeests are unable to migrate to seek their preferred forage when the grasses in their present restricted range dry. And the grasslands that are available to them have been altered by overgrazing.

*136 to most kinds of life, and certainly a barrier to normal wildebeest movements. If this area were less desiccated in previous times, it probably would have been the only point of contact between the eastern and western races of wildebeest. The Roosevelt collections from the Suswa area, however, would indicate that there had not been significant mixing of the races there, implying that any recent contact would have been on a small scale and any significant connection had been in the far past.

*136 184 224 *233 • 182 (262) No wildebeests remain in the northern area of the Rift. There are fenced ranches now south of Lake Naivasha and in the Rift adjoining the Suswa area. The remaining wild animals (kongonis, gazelles, etc.) are hunted on some of these ranches as food for labor. It appears that after the former wildebeest population of this area became isolated from the populations farther west (through Masai overgrazing in the Mosiro area) it was gradually hunted out. Kongonis and Thomson's gazelles are still found in this area.

Summary

*13 121 Masailand is centrally located in the system of grassland belts of Africa. The grassland ecosystems of Masailand are typical of the most biologically productive

*233
231 In 1904 the cattle numbers in Masailand of Kenya were estimated at about 50,000, and there were an estimated 600,000 sheep (Simon, 1962). By 1961 the Kenya Masai had a population of 973,000 head of cattle, 660,000 sheep and goats, and a large number of donkeys, "at least double the quantity that their land will carry during normal conditions" (Glover and Gwynne, 1961).

*233
232
• 182 Range Management of the Masai: Grass is recognized by the Masai as being important to their livestock. But in general those in Western Masailand appeared to have surprisingly little appreciation of the types of grass that were preferred by their livestock or of the effect of varying grazing pressures on the grasses. There are Masai names for a number of the grasses. Yet many Masai in the study area only know a few of the more common ones. When discussing grass foods the Masai almost invariably say that the cattle eat grass, as do the wild animals. There appears to be little appreciation of the differing diets or well defined preferences exhibited by these animals (see below). When inquiring about the names or characteristics of various grasses the typical answer we recieved was to the effect that we were fundis (experts) on grasses, while they were fundis on livestock. They would then point out that in a herd of several hundred animals they knew

*233
232 each one. This example, in fact, provides an insight
182 into the emotional nature of animal husbandry of the Masai.

*13 The Masai realize that bush is encroaching in
232 many areas and that the forage is not as good as it
182 used to be, but this is explained as a shauri ya Mungu,
*233 a matter of God's will, not man's. They will leave their animals grazing on an area where there is water as long as there is any grass left. The idea that overgrazing can weaken or kill grass plants appears to be either foreign to them, or it is outweighed by other considerations unknown to us.

232 With the exception of burning, discussed below,
182 we did not see a single example of any range management
*233 activity that was not directly based on water or disease.

*13 The original pattern of migratory or nomadic
*233 grazing followed by the Masai duplicated that of the
182 wild animals. Under the environmental conditions of Masailand it was and is probably the most efficient and potentially most productive way to use the rangeland. As will be discussed below, under the semi-arid conditions of Masailand many grasses cannot support heavy year-long grazing while they can thrive under periodic

#13 #233 #182 heavy use. The ranching schemes put in for the Masai in Eastern Masailand illustrate this point. Water holes were provided and areas were set aside for ranching projects. No real control was placed on the numbers of the cattle. The water allowed the cattle to remain in the areas throughout the year. Previously lack of water had enforced seasonal grazing with cattle and wild animals grazing the areas during the wet season and an almost complete rest during the dry season. Yearlong grazing quickly killed the perennial grass cover and without fuel for fires the brush encroached. Flying over Eastern Masailand now, one can easily pick out these grazing improvement schemes; they stand out as red blocks of bare, gullied earth.

Wherever yearlong water was provided for the Masai, they used it to increase their livestock numbers rather than to spread the grazing pressure of the existing livestock. The administration that provided the water did not enforce any limitations on numbers. Apparently all attempts to show the Masai the damage that overgrazing was doing to their own future ended in failure. Outside of a few particularly educated Masai, we know of none who appear to understand or appreciate the importance of the overgrazing problem.

*233
*13
232
731
• 182

A several years' drought culminated in 1961, and as a result of the extreme overgrazing in Eastern Masailand, thousands of cattle and many Masai died. As was evident on the ground, and as clearly pointed out by many -- even veterinary officers (Waddington, 1961) -- the mortality was due to starvation on range depleted by overgrazing before the drought. There was plenty of water for the animals to drink. The mortality in the cattle of Eastern Masailand ran from 300,000 to over 400,000 head, and I was told that over 1,000 Masai starved to death also. In spite of this dramatic illustration, the Masai to whom I talked in 1962 blamed their difficulties on the will of God or the Europeans who appropriated their land.

*136
*233
231

Masai Livestock: The Masai cattle of Western Masailand today are a mixture of breeds with short-horned zebu (*Bos indicus*) predominating. The Masai highly prize longer horned animals, and occasional herds will have a massive-horned Hamitic Ankole bull. It has been suggested (Payne, and Masai, verbal) that before the rinderpest epidemic of the 1890's the Masai cattle were predominantly long-horned. The rinderpest epidemic wiped out most of these animals, and the short-horn zebu, with its greater resistence to rinderpest, took their place. The short-horn zebu was introduced from

*233
231 We had the feeling, however, that donkeys just as other
554 livestock are a measure of success and security, and regardless of the need some donkeys would be maintained.

*136 These donkeys are small animals whose weight
231 is probably less than half that of a wildebeest (i.e.
*233 under 200 pounds). They are quite independent. We often saw the small herds of donkeys leave a boma unherded and go to a water hole, then graze back to the boma. This practice probably would not be followed in areas where predators were common, but in the peripheral areas it appeared to be the rule.

178 Large numbers of donkeys appear to have been
231 the rule for some time. Joelson in a general discussion
*233 of East Africa in 1928 referred (p.61) to the "Masai, who graze immense herds of cattle, small stock, and especially donkeys..."

*233
182 <u>Burning</u>
232 The Masai burn grass whenever it is dry enough
824 to ignite. The reasons they give for burning include the following: It produces a flush of new grass that is particularly palatable, nutritious and easily available for their livestock. It clears the woody growth and makes new grazingland. It clears or reduces ticks, tsetse fly, and disease.

ticks, tsetse fly, and disease.

233 372 152 Burning grassland appears to be a deeply ingrained cultural trait. Young herdboys will seek out and ignite small patches of unburned grass, sometimes only one or two feet across. We have watched Masai moran striding across a dry plain lighting matches as they went, leaving a long line of small blazes gradually joining together behind them. We have watched junior and senior elders lighting fires, as well as boys and moran. We had marked plots that were burned as much as four times in one year. So we would add to the above explicit reasons for burning, the implied reason that they also burn simply because they get some satisfaction out of it.

182 372 [171] Fires are lit with matches. Possibly some are started from cooking fires that get away. Some fires, especially in wooded areas, are started by Wanderobo honey hunters (see below). But virtually all the fires whose origins we investigated were lit by Masai.

177 372 182 It seems probable that the coming of Europeans has altered the fire regime by providing large supplies of matches. It is far easier to light fires with matches than by using flint or other primitive means. With fires

182 easier to light more fires are lit, just as in the case
177 of hunting tribes who have received firearms: with game
372 easier to kill, more game is killed. Control in these
[182] matters appears to be enforced by availability of tools and difficulty of accomplishment, not by any conservation ethic.

132 We questioned Masai, other Africans, and Europeans about lightning fires and never found the slightest evidence of lightning causing fires in the savanna country. There is no doubt that it ignites some fires in rim-rock or mountain areas, but we never even saw a lightning-struck tree in the study area. All the lightning we observed in storms was high, it occurred in heavy rain storms, or it was low in the region of Lake Victoria.

182
232 There does not seem to be any discipline or
824 organization to the burning by the Masai. Fires are
*233 started in dry grass when herds leave an area, but they are also lit when herds arrive in an area, if the grass is dry enough. They are even lit in pauses during rain storms.

The forest country on the hills is also burned at

*233
* 132 every opportunity. There the purpose is primarily to
232 clear new grazing land. During the 30 months of our
824 major study period, we were in sight of the Naw forest (at the foot of the Kau Escarpment) at least twice a month, often in the rains, and only once did we not see smoke from a fire burning in the trees or brush.

*13 Relations with Wildlife
648

The most significant influence the Masai have exerted upon the wildlife is their protection through
(171) excluding hunting tribes from Masailand. The Wanderobo are an exception, but there are relatively so few Wanderobo that they have little effect. The areas of East Africa where the finest assemblages of grassland wildlife still exist are those in Masailand.

224 The animals Masai hunt or have hunted include
(237) buffalo for shields and possibly food, eland for food and
(714) giraffe for hides
(531) the hides and tail hairs (to ornament gourds and dresses,
(825) according to Millais, 1920), lions and sometimes leopard for defense and for lion manes, and rhinoceros for horns and to spite national park authorities (particularly
*(233) in the past decade). In times of drought the Masai may spear various animals for defense or to avoid competition for scarce water. They will even spear elephants at such times (Grant, 1957).

*137
• 182

FIRE

Burning or the lack of it can determine the vegetation patterns within the study area. But fire is dependent upon fuel left or removed by the grazing animals, and on the season and timing of the burn which is determined by the Masai, Africans outside Maseiland, and Wanderobo (and now National Parks officials) who light the fires.

Except for the short grass plains of parts of the eastern Serengeti and Loita Plains, virtually the entire area of Western Maseiland was burned at least annually during the period of study. There are numerous small islands which the fires miss, and a few fairly large areas which are protected for various reasons, but fire is very general.

*137 Throughout most of the open grasslands there are shrubs and woody growth. These are suppressed by frequent burns. In areas burned annually the woody vegetation may appear as "seedlings" following the rain, yet examination of the "seedlings" shows that they have an extensive root system culminating in a hard often-knobby crown at ground level. They are several years old and apparently enough energy can be stored

19: Talbot K-4,5 (1956-1962)1964 FL12 Masai FL12

MAN'S ROLE IN THE GRASSLAND ECOSYSTEM

The Masai are not now and probably never have been in a real equilibrium with their environment. Their history as we know it can be interpreted as roughly parallel to a part of the Americans' exploitation of the United States; exploiting a bit of land and then moving on west until there was no more land to the west.

The exploitation of land by the Masai was a very long term process until the advent of the Europeans. The combination of peaceful administration, veterinary services, and matches have greatly accelerated the rate of exploitation, but they do not appear to have altered the basic processes. The only difference is that this time the Masai have no more land to the west.

It would be interesting to know if this basic lack of equilibrium with the environment was common to other pastoral tribes in Africa and especially those who preceeded the Masai.

As described and discussed above, the grassland ecosystem in Western Masailand, including its wild fauna, is maintained -- and created -- by a combination of

*13 grazing and burning. We have no evidence of fires in
3H
182 the area lit by any agency other than man. Fires might be started at rare intervals by Lengai Volcano. They might be ignited by lightning. But if the climatic regime of the past 20 years or so is typical, lightning fires must be exceedingly rare. Creation and maintenance of the grassland ecosystem requires frequent burning. The inescapable conclusion is that man is very closely associated with the origin and maintenance of the ecosystem.

This conclusion is obvious and not new. Swynnerton in 1936 (p. 464) discussing the spread of tsetse files wrote:

> The wooded savannas which cover east Africa today are essentially the product of a cultivating, grass-burning man. Few fires are lighted by nature, and fewer still can have arisen when the whole country was under the cover of the evergreen forest and deciduous thicket which evidently preceded so much of the savanna and which today succeeds it when we exclude the grass fires. Whether our savannas originated before the advent of man or after -- perhaps many thousands of years ago in a man-settled Sahara with a moister climate than today -- none can say. It can, however, be said with some confidence that G. morsitans and G. swynnertoni, the two tsetse species that essentially belong to savanna, owe their present distribution to man.

*13 Yet there is a curious reluctance on the part of many to accept the importance of human activities in shaping the landscape. H.C. Pereira wrote (pers. comm. 1961) that: "All ecologists agree that natural tree and grass savanna associations in Africa are stable climax

FL12 Masai FL12

If he is a man of wealth and importance he may be elected chief[1], in which case he is responsible for the discipline of the warriors and their appearance when summoned to fight, though he does not go to the wars himself. As with most East African tribes an elder's ideal of existence seems to be ease, not unmixed with drunkenness. Proverb No. 64 (p. 249), 'Don't lie with your feet against a post like the father of many sons,' meaning 'Don't give yourself airs,' is a vivid picture of the Masai pater familias taking his ease in the primitive posture of lying on his back with his feet against a post, while his family do all the work for him.

Masai women, unlike the men, are carefully dressed in leather garments, but a rare, and according to our ideas most unbecoming, custom forces them to shave their heads. Before marriage they are circumcised, and signalize their change of state by wearing large circular earrings and necklaces of brass and iron wire. Both girls and women have their legs and arms encased in iron ornaments, so that they can sometimes hardly walk.

This military organization of the Masai made them a most effective body for destructive military operations, and explains not only the predominant position which they acquired in East Africa, but also the respect which they inspired and the extent to which their customs were imitated by other tribes. On the other hand, it probably also is the reason why they never founded any state or polity analogous to the kingdoms of Uganda and Unyoro. The centre of political gravity was not with the elders or chiefs, but with a republic of young men, governed by ideas of military comradeship and desirous only of military glory. Retirement from this band of warriors as a chief was honourable, but seems to have been recognized as a removal to an inferior sphere of activity. The chiefs arranged the details of the raids which the warriors wished to undertake, but their power of compelling them to do anything which they did not wish was very slight.

The nearest approach to a central and superior authority among the Masai is the medicine man or Laibon (more correctly Ol-oiboni; see p. 324, &c.). They all belong to the Kidongi family of the Aiser clan, and are said to be descended from a personage called Ol-le-Mweiya, who came down from heaven and was found by the Aiser sitting on the top of Mount Ngong. This was nine generations ago, the genealogy having been preserved. The influence of the

[1] The chief is elected from the warriors, but leaves their ranks at once and becomes an elder.

9:Fosbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

and alien children; the latter frequently come to be regarded as tribesmen by this process. 597

First of all a Masai adopts any child born to his wife by anyone other than himself, including those born prior to marriage: in fact a betrothed girl is frequently left in her father's boma until she bears a child. The child of one's own loins is called *oiunoto*, that of another *engera oilaitalak*. No distinction is made between the two, and the latter term is generally used playfully. [192]

If a man has one wife with a number of children, and another who is barren, when the former gives birth to another child, there is a ceremony by which the latter may adopt this child. The adopting mother sits on the after-birth, and pays to the true mother a cow and calf called *nongeya*. She takes over the child as her own ,and it is asserted that by stimulation of the breasts and special food, lactation can be artificially induced, even when the foster-mother has never given birth. The fact that a woman has adopted a child in this manner is seldom referred to afterwards — the child is regarded as though she herself had given birth to it.

In the olden days children were frequently captured in war and adopted into the tribe: such a child is referred to as *ol arnoti lembere*. It was, and still is, not uncommon for a Masai to adopt an alien's child; at times this will occur when the Masai marries the alien's daughter and adopts a younger son; or in time of famine amongst aliens, the Masai may find an abandoned child, or be given one to look after; or he may give some cattle to the alien for the privilege of adopting the child. The use of the word 'purchase' has been deliberately avoided, for neither party looks on the transaction in this light. A son acquired in this manner is called *atabarno*. These last two categories of adoptee can inherit the cattle of their foster-mother's house, whilst their children can inherit the 'gate' like any other Masai. 597 727 597

A peculiar custom of adoption exists amongst the Engidong or laibon's clan. Any Masai, child or adult, can attach himself to a member of the clan, and such person must treat him as a son, giving him cattle, and arranging his circumcision and/or marriage. Such a person is called *ol onito*, as also are the numerous Kikuyu received into the clan. The relationship is terminable at will, the adoptee shaving and departing, but leaving behind everything that he has been given. Though theoretically applicable to the whole clan, such adoptions usually only take place in the laibon's immediate family . 597 184

These notes on adoption are by no means full: they may, however, be sufficient to emphasise that it is a mistake to regard the Masai as being racially pure. If they come in time to accept new ideas as readily as they accept new blood, their rapid advancement would be assured. 144

It is important for a number of reasons to know who holds the purse-strings in a Masai family group, but it is a question to which no definite answer can be given. Rules, where they exist, are seldom followed — in such intimate family matters it is personality that counts. 422 593 [183]

The cattle which have been allocated to a woman in trust for her children are nominally in her control. The elder looks after the animal

/50 cont./

837 /footnote 1 cont./ husbands. Babies to whom a
[861] woman has given birth from thus living with
another man belong to the husband, even though
they also call their genitor father.

847 They abort an immature fetus when the
woman has been made pregnant by another who
is sick or old or feeble. Remedies in the form
of a potion are used, which are said to be in-
noxious during the first two months of pregnancy.
After two months of pregnancy they wait for
parturition and kill the newborn child.

833 They are accustomed to having intercourse
lying on their sides, the woman's upper knee
placed over the man's loins. They do not
customarily cohabit except at night. They are
afraid of coitus in daylight, lest the man's
blood transferred to the vessels of his wife
would retain nothing but water.

[864] Boys and girls already begin to practice co-
habitation at the age of eight to ten.

514 It is considered extremely shameless to
break wind in the presence of women.

V.

000 Pregnancy. -- Behavior of the pregnant woman and her husband. --

dren's games.

843 As soon as the woman feels pregnant, the spouses separate until
853 after the nursing period, which lasts approximately 1 1/2 to 2 years.
• 183 Another man may not touch the woman during this period, any more
than her husband. This stipulation, however, seems to be little

/50 cont./

843 observed, since as a rule a new pregnancy ends the nursing period.
[853] The pregnant woman removes the ornaments that she previously
[183] wore, in order -- as the Masai explain this custom -- not to entice men. During the first five months of pregnancy the woman lives as usual with respect to food and drink. Then she is given a broth of
[262] lung, liver, and kidneys cooked with a bitter-tasting tree bark (2)

2. From Albizzia anthelmintica.

called ol mokotan, and milk, only the latter during the last month. Through this the woman is supposed to become as exceedingly thin as possible, so that the birth will proceed easier. She may not eat the meat of fallen livestock. The husband during this time need not subject himself to any special diet or special acts, but he may not go to war, for it is believed that he would die on the way. Shortly before the delivery the husband may not leave the kraal or its immediate
[732] vicinity. If he should tease a crippled person or mock him because of his infirmity, the awaited child would come into the world af-
844 flicted with the same defect. /51/ For a successful delivery the
[782] pregnant woman prays: 'Ng ai ndaba 'ndubuggu en tiamassi (1)

1. Or en diamassi.

= "God let come out healthy -- the monster," as the unborn child is called. The woman gives birth in her hut, which on this day may be entered only by women and girls. A midwife (eh gaitoijoni, n gaitoijoh) provides or performs the necessary assistance. If the newborn child is a boy, the midwife calls out that blood should be drawn from an ox as food for the woman in childbed; in the other case, from a heifer. Through this the father also learns the sex of the new-
[782] born child. During the birth process the women who are in the hut or standing around it cry to God for help and assistance in shrill, often
845 plaintive voices. The birth of a boy is more desired than that of a
[842] girl, but the greatest joy prevails at the birth of twins, especially if both are boys. In that case the woman often keeps only the first-born child with her, while the second one is nursed by another suitable

Wild animals.

The Masai ate the flesh of no wild animals when in olden days they all had cattle; but some of those who have lost all their cattle are now beginning to eat venison, like the Dorobo. [178]

If Masai boys kill elephants, they only take the tusks, which they exchange for cattle.

When buffaloes are killed, the hide and the horns are kept. From the former the warriors make their shields, and from the latter mortars are cut in which medicines are ground. The medicine-men also use the horns to put stones in for their prophecies. 237 [914] [915] [787]

[1] It was recently estimated that the Masai in the Naivasha Province own 35,000 head of cattle and 250,000 goats and sheep. Those living in the Ukamba Province and in German East Africa are, however, much poorer, most of their cattle having died of rinderpest some years ago. [233] [184]

[2] The northern Masai sometimes use o-singir (pl. i-singiri) for a fish. The southern invariably use o-singiri (pl. i-singir).

881 593 of so-and-so. When he replies to his name, he is told to go and make a profit. He answers: " Herds and flocks ". This is repeated four times, and the ceremony is over ".

554 561 881 593 The ceremony is performed only once in a man's life, namely when he " wishes to have his eldest child circumcised ". This particular circumstance shows that by " the passing of the fence " a man obtains a special elderly status which gives him a right to have all his children initiated.

Thus, there is a relationship between the father's social status and the initiation into the age-class of his son's. None of these may be initiated unless the father has reached the proper status. The personal status of the father is reflected on his children. Therefore the " passing of the fence " is not in itself part of the age-system initiation, but a condition which must have been observed before a man is allowed to have his sons initiated.

[565] Other authorities (Fox) have stressed the fact that class membership of a Masai is somehow dictated by the class to which his father belongs. " The passing of the fence " gives a special emphasis to this fact and shows how a Masai's initiation into a class is conditioned by the social status of his father. It shows how the structure of Masai society stands on the balance of status of its members. [41]

881 634 [184] " *The tearing of the ox* " (*Embolosat ol Kiteng*). [42] Though this ceremony is performed by a single section or a group of sections, its performance has a far reaching value which is accepted throughout Masailand. The ceremony is performed by such sections as the Kakonyuke, the Dalalakotok and the Purko (all Kapiti). According to Fox the Kisongo also perform it. But this is denied by Fosbrooke, who qualifies Fox's statement by saying that the Kisongo acknowledge and respect the value of the ceremony performed by the Kakonyuke. [114]

881 561 634 As a matter of fact special importance is attached to the ceremony performed by the Kakonyuke, who in any case must be the first to do it and who have the lead in the matter. All the sections which

[41] The social balance between the father and his son is only an expression of a wider and basic principle, which, in our opinion, is an essential principle of Masai social organisation: the principle of the distribution of power. See Bernardi, *l. c.*, pp. 326 ss.

[42] Fox, *Notes on Marriage Customs among the Masai*, in *J. E. A. U. N. H. S.*, 42-43, 1931, pp. 189 s.; Leakey, *l. c.*, p. 448: *NAD*, 1926, p. 9, n. 13; 1927, p. 15, n. 61; Fosbrooke, *l. c.*, p. 27.

2: Bernardi E, M-4 (no date) 1955 FL12 Masai FL12

Endungore-Engibata is performed both by the 'right-hand' and the 'left-hand' age units. This shows that the ceremony has a direct effect on the institution of the age units as such and not as coefficients of the age-class. The formation of the age unit takes place during an official period in which all its prospective members must be properly initiated. This official period is primarily defined by the performance of *Endungore-Engibata*. 881 561

Endungore-Engibata obtains its value by emphasizing the negative aspect of the new initiation period, namely by making it illegal, a new *piron*-relationship having been established, to initiate any one except on the new *piron*-elders' authority, and by closing the association of further members to the previous age-unit. [60]

Engibata, therefore is to be considered as the opening ceremony for the institution of the age unit. After *Engibata* candidates are legally initiated and automatically, i. e. precisely for having been initiated during a definite approved period, become members of that age unit.

From a territorial point of view *Endungore-Engibata* is a sectional ceremony. It is performed by minor territorial sections, but no single performance is acknowledged throughout Masailand, as in the case of *Embolosat*. This makes clear the different value of *Embolosat* and of *Endungore-Engibata*. *Embolosat* opens the period for the institution of the age-class, and therefore its value is accepted [634] [184]

lage) and drank the beer themselves. It is confirmed by numerous reliable elders, that, even if the *laibon* had given his sanction for the circumcision, the *Dareto* elders would have been justified in acting as they did". Note the prophet's limited authority.

[60] This is [illegible]arly shown by the case reported by FOSBROOKE and quoted in previous footnote. The *Dwavi* man had failed to inform the *Dareto* elders (the *piron*-elders) of his intention, and very probably his sons' initiation was intended to be performed by the outgone *piron*-elders. If the *Dwati* man had his own way, his sons would have become members of the last age-unit, but illegaly: hence the so strong objection of the *Dareto* elders. The above explanation is confirmed by what MERKER, pp. 70 s., states, namely that a fourth minimal division, *el oirogua*, could be formed by those who were circumcised immediately before the official closing of the period for individual initiation. See below. In *NAD*, 1937, p. 32, n. 54, we read as follows: " the Officer in charge reported that a number of *layok*. (uncircumcised boys) who would have been too old to await the next '*Ngebata*' were circumcised and incorporated in the *Kidoto* age ". Probably this is a similar case as that referred to by MERKER. The case shows that there is a definite closing time for every set. After this time every new initiate will be associated with a new set.

2: Bernardi E, M-4 (no date) 1955 FL12 Masai FL12

monies are not performed by some selected individuals on behalf of others, as for *Embolosat* and *Endungore-Engibata*. Also from a territorial point of view all these ceremonies differ. A single performance of *Embolosat*, which opens the class-period, is valid for all Masailand; *Endungore-Engibata*, which opens the unit-period, is sectional; individual initiation is held at each village. The following diagram illustrates the correspondence.

A candidate's age for individual initiation is indicated by FOSBROOKE as 16-17 years. The principle for admission to initiation seems to be that the candidate must have passed his puberty, and his father must have performed "the passing of the fence" as described above. [67]

Circumcision is the central point of Masai individual initiation. The ceremony is performed in three stages, *a*) a testing of the past moral behaviour of the candidate; *b*) the ordeal of circumcision; *c*) a period of special segregation.

a) On the eve of circumcision day the candidate is completely shaved by his mother. The elders are entertained with meat and beer [68] at the house of the candidate's mother. [69] Then the elders

[67] Cases may occur of boys who have to be initiated at an earlier age for some special reason. FOSBROOKE, *l. c.*, p. 28 records the instance of a father's orphan having to be initiated in his early puberty in order to inherit.

[68] HOLLIS, *l. c.*, p. 297, states that a bullock is slaughtered and called *ol-oirupukiniek* — the (animal) that has caused him to be taken out of the boys' ranks. FOX says that a number (5, 6 or 9) of gourds of beer are offered to the elders.

[69] There is no special meaning in the use of the mother's house. The custom is occasioned by the arrangement of a Masai polygynic village. Every

2: Bernardi E, M-4 (no date) 1955 FL12 Masai FL12

warriorhood ". He also states that *Unoto* " is probably the best known and most misconstrued ceremony in the Masai age-grade system ". 884 561

Unoto is not performed at a single place for whole Masailand, but in every territorial section or group of sections. [90] It consists of three main stage: (a) a testing of the candidates by the elders; (b) the election of the ceremonial leader of the unit; (c) a sacrifice of a bull. [634]

a) The first stage takes place in a special hut called *singira*. [91] Not all the candidates, i. e., junior initiates, are allowed into the *singira*, but only those who have kept the sexual regulations which bind junior initiates. In order that no one may enter the *singira* under false pretences the entrance is bewitched by the elders. According to LEAKEY, [92] another test is performed insidie the hut aiming at detecting those who have entered surreptitiously. [346] [834] [754]

In the annual report of the *NAD*, [93] we read that every candidate is expected to give " an account " of his past life. " The importance of the *E-Unoto* " states the same report, " lies in the fact that it imposes an obligation upon a warrior who has disgraced himself in any way to clear himself of the stigma before he can marry and settle down as a respected Elder of the tribe ". " The *O-Singira* " says FOX, [94] " gives the warriors permission to have sexual relations with initiated women ". [783]

b) The nomination of the ceremonial leader (*ol aunoni*, pl. *il aunok*, or *ol otuno*) takes place inside the *singira* hut. The elders 561 624

[90] LEAKEY's statement, p. 194, that at the *Unoto* " all the members of a given group (i. e., age-unit) from the whole of the Masai country, north, south, east and west are required to be present " is emphatically denied by FOX, p. 451, and FOSBROOKE, p. 29. According to FOX the following sections perform it: (a) Purko; (b) Loita and Siria; (c) Damat; (d) Kuputiei, Lodokilani and Matapatu; (e) Laitokitok; (f) Kisongo. And FOSBROOKE says that the *Unoto* is celebrated " by sections or groups of sections " and is attended by as many warriors as possibile, " but by no means all ". SANDFORD, on HEMSTED's authority, recorded that the *Unoto* was held by the Purko, Kakonyuke, Dalalekutuk and Damat on the Kinangop. The Sigirari, Matapatu, Kaputiei and other divisions where it suited them best. [114] [184] [634]

[91] There are contradictory descriptions of the *singira*. MERKER states that it is a 'very big hut'; BAGGE says " not so big "; HOLLIS " small ". Leakey and Fox state respectively " an enormous ", and a " very large " hut. Probably it all depends on the actual number of the initiates involved.

[92] LEAKEY, *l. c.*, p. 195.

[93] *NAD*, p. 21.

[94] FOX, *l. c.*, p. 452.

2: Bernardi E, M-4 (no date) 1955 FL12 Masai FL12

time. Then the dance is resumed until night. At this stage the initiate is allowed to have intercourse with his wife. 561 [525] [533]

The next morning the initiate, as soon as he rises, again drinks some milk. Then he is smeared all over with a special mixture by two of the elders, who also present him with an olive and a bamboo stick. A procession is then formed from inside the hut, where these ceremonials have been accomplished, to the cattle kraal. Here the elders choose four or eight " (it must be four or eight) " head of the initiate's cattle, end he hits each one of them with his olive stick.

The initiate must now remain inside for five days. On the fourth day his mother pours liquid, half milk and half water, on his head, and then the mother shaves him.[158] The ceremony is now complete.

FOSBROOKE,[159] makes reference to a similar ceremony " by which a *moran* is permitted to drink the milk from his wife's cattle ".[160] He then remarks that " this does not, however, permit him (the initiate) to drink milk by himself; this must always be done with his age-mates until such time as all go through the *ngeherr* ceremony ". This indicates that " that *ngeherr* of milk " must also be considered as an individual anticipation of the status officially recognised only at the corporate ceremony.

We do not possess any detailed description of " the *ngeherr* of meat ". We are informed by FOX,[161] that the ceremony takes place, and he records it as " the second *ol-ngesher* ceremony, called the *Ol-ngesher* of meat ". After such ceremony the initiate may eat meat freely, and, if he chooses, eat meat which has been touched by a woman. [262]

The *ngeherr* proper is the closing ceremony which finally institutes the age class. It is celebrated by the Kisongo, but acknowledged and accepted throughout Masailand.[162] The ceremony is briefly described by MERKER,[163] as follows: " when all the members [184]

[158] These formalities may be performed either by the candidates' mother or his first wife, provided the latter had not conceived while he was still uninitiated, or by the two women together.

[159] FOSBROOKE, *l. c.*, p. 30.

[160] The expression " his wife's cattle " sounds inaccurate and indefinite. Probably it refers to the initiate's cattle tended by his wife.

[161] FOX, *l. c.*, pp. 453 s.

[162] FOSBROOKE, *l. c.*, p. 30, states that the ceremony " is traditionally held at *oldonyo loo 'l moruak* (the hill of the Elders), Upper Sanyas, Moshi District.

[163] MERKER, *l. c.*, p. 73.

2: Bernardi E, M-4 (no date) 1955 FL12 Masai FL12

is also confirmed by the fact that, as Fox [168] states, " the generation 561
names (i. e. class names) emanate from the Kissongo in Tanganyika Territory and are common to all the Masai. They are given soon after the warriors (initiates) of the two combined ages (age-units) have become elders. Therefore the age-names (i. e. age-unit names) tend to fall into disuse and be replaced by the generation names (i. e. class names) ". (Words in brackets mine).

It should be noted here that the acknowledgement of the Kakonyuke *Embolosat* and of the Kisongo *Ngeherr* by all the Masai is the more remarkable if one considers the tendency of each territorial section to hold ceremonies of its own for the institution of the age-units.

X – THE GENERAL PATTERN OF THE INITIATION CEREMONIES

At this point, when all initiation ceremonies have been studied, 561
it may be of interest to note that the ritual patterns of all these [184]
ceremonies, whether their value is territorially sectional or extends throughout Masailand, are essentially similar. Initiation ceremonies are made up of four main elements: *a*) testing and instruction of candidates; *b*) election of a leader; *c*) sacrifice of a bull; *d*) ceremonial fire.

a) The testing and instruction of the candidates is a broad expression which covers various rites performed at different times. It refers to all the ordeals (except circumcision) and confessions which candidates are expected to pass through, and to the instructions, blessings and prayers which the elders impart to, or offer for, their *piron* candidates.

b) Contrary to expectation the office of leader holds no attrac- 561
tion for the candidates. Very probably the reason is that such lea- 624
ders, or officiers, as the *aigwenani* and *aunoni* are expected to act in a fashion which is not the fashion of their own age-mates at that moment. Indeed they are forced to act as elders when their companions are being recognised as junior or senior initiates. There is no detailed account of the election of the class-leader (*el-lòo-surutya*). If that opposition to office is viewed in the background of the leader's limited and temporary authority in the age system, it may be taken as a further indication that these leaders have nothing in common with political chiefs as found in centralized societies.

[168] Fox, *l. c.*, p. 449.

*648
177

discarded their old formations, adversities of various descriptions have introduced the necessity of undertaking manual labour in portions of each reserve and a succession of punitive expeditions or displays of force, the last of which occurred some ten years ago, has brought home to them a conception of the power of the Government, a realization which has tended towards a more progressive attitude owing to the diminution which it caused in their minds of the influence held by their medicine-men. No punitive expedition has ever been undertaken against the Masai, an omission which was very largely due to the authority and sagacity of Lenana, the chief medicine-man at the time when the European Government was first encountered, who survived long enough to keep his people in check until such a degree of administration had been effected as to render the despatch of a punitive expedition a measure that would only be resorted to in the last extremity. Further, the Masai now thoroughly realize how vulnerable they are if ever they come into armed conflict with the Government. Their enormous, immobile herds would immediately be lost and a sufficient degree of punishment could quickly be attained. For this reason, it is extremely improbable that they will, of their own initiative, so far forget what they consider to be their best interests as to cause a serious disturbance. The escape from punitive expeditions, however, has undoubtedly been a factor in the perpetuation in their original form of the Masai ideas and traditions.

101
184
598
628

The tribal formation of the Masai.

As will be seen in Chapter II., the Masai tribe originally consisted of both pastoral and agricultural sections, of which the latter was almost annihilated by the former and survives at present only in one or two scattered localities, mainly in areas reserved for other tribes. A small section of these agriculturalists, the Nguruman, is to be found at the north end of Lake Natron, but that is the only trace of them in the present Masai Reserve, and these people now show a tendency to assume the habits and customs of the pastoralists. The problem presented in the administration of the Masai is therefore almost exclusively concerned with the pastoral section. According to the social system of this section, the male sex is divided into boys, warriors and elders. The first stage continues until circumcision, which may be performed approximately between the ages of thirteen and seventeen. These boys are called "'L-Ayok." After circumcision, they become warriors, or "Muran," those who have been circumcised at about the same time being said to belong to the same age. The "Muran" remain on the fighting strength of the tribe for periods varying from seven to fourteen years, during which period they constitute a standing army. They are divided into Companies, or "Sirits," which live in separate villages, or "Manyattas," some of these containing as many as six or seven hundred fighting men. With few exceptions, the "Muran" of the present day perform no work of any kind. In days gone by, they were expected to carry out raids and preserve the armed prestige of the tribe, but the introduction of the "Pax Britannica" has deprived them of such employment, and they, having found no alternative occupation, are content to remain in idleness and to live in the state of free love with immature girls which tradition prescribed as the duty of the warrior in the days of tribal warfare.

561

Social system of the pastoral section.
"'L-Ayok."
"Muran."

The effect of the military organization.

This military organization of the Masai made them, in the past, a most effective body for destructive military operations, and explains not only the predominant position which they acquired in East Africa, but also the respect which they inspired and the extent to which their customs were imitated by other tribes. On the other hand, it probably also is the reason why they never founded any state or polity analogous to the Kingdoms of Uganda and Unyoro. The centre of political gravity was not with the elders or chiefs, but with a republic of young men, governed by ideas of military comradeship and desirous only of military glory. Retirement from this band of warriors as a chief was honourable, but seems to have been regarded as a removal to an inferior sphere of activity. The chiefs arranged the details of the raids which the warriors wished to undertake, but their power of compelling them to do anything which they did not wish was very slight.*

elephant is attacked at close quarters, the arrow part driven into the great brute, and being loosely fixed in the handle, it remains when the latter is withdrawn. Another arrow is then affixed, and the same operation performed. It is said that an elephant will live a very short time after being thus stabbed, and entire herds are killed without one escaping, so dexterous and daring are these hunters. The Andorobbo also use the ordinary bow and arrow, but only for the smaller game. D 224 411

CHAPTER XI.

THROUGH KAVIRONDO TO VICTORIA NYANZA.

THE people (Wa-kwafi) of Njemps presented an interesting study to the observer as throwing light upon the origin of the various small tribes which people Africa. Unquestionably Masai in race, and only separated from that tribe through the loss of their cattle and the consequent necessity of breaking their cherished convictions by cultivating the soil, they had developed new ideas, manners, and customs in a comparatively short period. M 101 184

They did not by any means supply an argument in favour of the vegetarians; for in personal appearance they had distinctly degenerated, and could not for a moment compete with their aristocratic carnivorous brethren of Lykipia. This was especially noticeable among the women, who had lost their slender, *genteel* shape and acquired the ill-proportioned, unwieldy contour of the negress. Perhaps an exception might be made in favour of the young women, many of whom were well-formed and characterized by most pleasing and interesting manners. M 142 184

The colony consisted of two villages—Njemps of Guaso Tigirish, close to our camp, and Njemps of Guaso na Nyuki. The houses were of the haycock order, with floors beneath the level of the ground, very small and badly built. They were surrounded by a double fence of thorns, which, however, are a greater source of danger than of protection, as in this dry climate they become like tinder, and consequently can be set on fire easily. If this were done at several points simultaneously, the inhabitants could easily be burned to death. M 361 M 342 351

In a hazy sort of way they tried to keep up the distinction M 184

FL12 Masai FL12
Wa-Kwafi

M
184 between the married and the unmarried people, very little work being expected of the latter, and the sweetheart system being preserved. They all, however, occupy the same village,
262 and of course the young men cannot afford to live on meat,
184 though they always come in for the lion's share when any of it is going. When parties go off on war-raids, they also contrive to eat a bullock by way of getting up their courage.

578 They lead upon the whole a very miserable life, ever threatened with destruction by the Masai, who have swept off several villages and all their cattle. The soil being the
132 very richest loam, brought down from the mountains and
134 spread over a comparatively level plain to the south of the lake, it is capable of producing anything; only the extreme dryness of the air and the very small annual rainfall, confined to a couple of months, keeps it sterile and barren.
312 To ameliorate this unhappy condition of things the Wa-kwafi have developed a wonderfully ingenious system of irrigation by artificial canals of (for them) great magnitude. They construct dams across the deep channel of the Guaso Tigirish and thus raise the level of the water to that of the plain, and then, by an intricate network of channels, they spread
262 the precious fluid over a large area, and raise their millet
241 and melons. These products form almost their sole food, eked out by what they are able to kill in the chase and by fish from the river, though when meat is scarce they are not
136 disdainful even of rats. Of these there were simply
123 myriads. They swarmed everywhere, and nothing was too sacred for them. Need it be wondered if "oft in the stilly night" were heard imprecations loud and deep upon the wretched pests when I have been wakened up by my nose being bitten or the sanctity of my toe invaded. My books were devoured, and even the bullets in my cartridges were not too indigestible. Everything, indeed, had to be kept under iron or hung up under sheds as represented on page 313.

157 As in the case of the Wa-taveta, the Wa-njempe are singularly honest and reliable, so much so that valuable
123 goods and equally valuable food are left in their charge with the utmost confidence, and I have heard of no case of this being violated. To me, one of the most remarkable features in the character of the young women and girls was their absolute unconsciousness of fear in my presence, and the complete confidence they seemed to have in me. They indeed took

9:Fosbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

in the course of which a curse is laid on a circumcision knife, and a fire-stick is ceremoniously broken. The actual ceremony is perhaps worked in conjunction with the *engibata* (see below), but the knowledge that it is about to take place is a sufficient deterrent to prevent unauthorised circumcision. The example has already been quoted (with reference to the laibon and age-grade ceremonies) of how, during his tour of Southern Masai in 1938 (June) ,the Laibon, Mbeiya, decreed at Kibaya, Makami and Simanjiro that the *endungore* ceremony should be performed in a certain manner. In 1939 ,a certain Dwati elder at Naibormurt had brewed beer in preparation for the circumcision of his son. The Dareto elders, hearing of this, visited his boma in force, with the intention of spilling all the beer. In point of fact they drank it in company with the offending owner, but none the less they prevented the circumcision from taking place; this in spite of the fact that the *endungore* ceremony had not been actually performed. 561

The ceremony of *Engibata* appears to be a recruiting campaign for the new age. Bands of youths who are of a suitable age for circumcision wander round the country dressed as moran, but carrying only bows in their hands. They send news to a certain elder, by an olamal (deputation) of nine of their fellows, that they will visit his boma. The elder prepares food, milk and an ox, and any youths of the boma who are ready for circumcision are duly prepared to enter the *engibata*. The band thus wanders round the countryside adding to its numbers *en route*. This ceremony is performed four times without further incident, (twice only in the case of a left hand circumcision); on the conclusion of the fifth *engibata*, by which time all suitable candidates in the area concerned have been enrolled, the youths retire to a secluded spot in the bush, in company with the il piron elders. A beast is slaughtered, blessings invoked on the new age, and each boy given a strip of hide from the ceremonial ox.

There is a further pre-circumcision ceremony practised only by certain sections of the Masai, notably the Kenya Kakonyuke. It is said to occur prior to the above two ceremonies. The ceremony appears to be somewhat on the lines of the Unoto (see below): choosing a master of ceremonies from amongst the participants, seizing an ox by the horns, rivalry between sections, are all common features. The Kakonyuke ceremony must be performed before all others, and is attended by representatives of those sections who do not hold a ceremony of their own. There is, however, no information of representatives of the Kissongo attending this ceremony — in fact in South Masai the elders are extremely vague as to its meaning — but that the new age is formally inaugurated by *Embolosat* in Kenya is fully confirmed by the elders round Mondul. [184]

The choosing of a laigwanan or spokesman for each age and each area normally takes place in the hiatus between the end of one circumcision and the commencement of the next, i.e. at the same time as the above ceremonies. The method of their choice and their presentation to the laibon are dealt with elsewhere. It is sufficient to say here that between one generation and the next there may be a gap of two or three years, so negotiations are not hurried; between the two ages of one generation the gap is probably less, but the ceremonies are likewise less important.

9:Foxbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

After going through the ceremony, the new elders can drink milk alone, eat meat that married women have seen, carry about short bladed spears (*emberre aere*) in place of the long polished warrior's spear; in fact all the customs of warriorhood are abandoned. 561

On return to their homes those who are not yet married do so at the earliest opportunity. Those who are married, if their fathers are still alive, move off from the paternal boma; for they are now in complete control of their cattle, and if they stayed with their fathers there would be constant bickering on animal husbandry matters. 577 578

From the foregoing it may be concluded that the average Masai male spends at least 10 years of his life as a moran. What are his economic duties and privileges during this period? In olden times his primary duty was to defend the country and, by raiding other tribes, to maintain and increase the cattle population. But European intervention has deprived him of his main occupation, and the only duties which the moran by custom seem bound to perform to-day are (a) drawing water from wells for his father's cattle or superintending their watering at flowing streams, (b) cutting the thorn tree branches which form the fence of the boma, and (c) escorting home night-bound cattle or searching for lost beasts. It was natural that few everyday tasks should be imposed on the standing army, but although the military duties are now in abeyance, the moran have retained the privilege of freedom from responsibility together with many other perquisites. These include access to the unmarried girls and the right to demand milk in any boma. In the matter of bullocks for slaughter in *ol pul*, the camp at which the moran may alone eat meat, the warriors seem to have a fairly free hand; if an elder withholds his consent, his moran son (with friends) will frequently help himself. It is not improbable that with the prohibition of raiding the moran exert these privileges in greater degree than they used to. If the elders are to be believed they spent a considerable portion of their time as warriors absent from home on raids, living in the bush on stolen cattle preparatory to stealing more. Consequently the time which they spent wandering round the bomas making their demands must have been considerably curtailed. 578 578

Another duty, or rather, restriction placed on the moran was abstinence from tobacco and beer. The former is largely breaking down, but fortunately the latter still holds to a considerable extent. This is not so with the Arusha, amongst whom drunken brawls between groups of moran are not infrequent. 579 580 581

The above largely refers to the unmarried moran; once they settle down, even before the *ngabeer* ceremony, their mode of life is practically indistinguishable from that of a newly made elder.

Elderhood is in itself marked by different stages, each of which has its own privileges and responsibilities. The members of the generation immediately above that of the moran are mostly concerned in family matters, establishing their own gates, marrying and performing ceremonies to ensure the fertility of their wives. The generation next above the most junior elders, as explained earlier in this chapter, is responsible for the

9:Foxbrooke G-5 (1936-1948) 1948 FL12 Masai FL12
Kisonko

614 a woman of his own clan. But in certain cases groups of sub-clans within the clan may inter-marry (as shown on the chart), but when this occurs certain payments called *enganyit* are made.

The true status of the Laitayok is discussed elsewhere (Sect. 1) their clans are shown on the chart separate from the main body of Masai clans.

423 One of the most important aspect of the clan system lies in the owner-
619 ship of waters. It appears that in the old days, when a new country
628 was conquered, each moran, so far as he was able, claimed a water on behalf of his clan. Thus all the Naberera and other Central Masai wells are in clan ownership, as also are the springs round Longonot, Kibaya, etc. The senior member of the clan resident on the water is in control, and, in consultation with the other local clansmen, determines the order of watering.

The main practical application of this knowledge is that in effect the users of the water form a council for the settlement of disputes, under the 'chairmanship' of the owner. For example at Landanai a dispute arose as follows:—

A migrating Masai may demand, and must be given, water at any well or spring, when actually on the move, drinking in priority to any local cattle. A moran claimed this privilege at Landanai, the elder who was watering his cattle refused, and a fight ensued. The local users of the water reached one decision in the matter in the absence of the 'owner' of the water; when he heard of this he was furious, called another meeting, and the original decision was reversed.

In other words, when waters are in clan ownership, there is a definite system of settling disputes arising from the use thereof; further, as the clansmen frequently meet on the water, other matters — marriage, debt, etc. — come up for settlement before the tribunal.

The value of these tribunals should not be overstressed, since in
● [99 178] many cases waters are not in clan ownership; where water is abundant, as in a river or furrow, the water is communal, (*ewpere loongishu*): in other areas where recent migration has ousted the original owners, the clan system does not apply.

614 In certain areas clan feeling manifests itself in other ways. For instance at Laitokitok in Kenya the Molelian and Laitayok have separate manyattas, and act independently in certain tribal matters. Near Loliondo it was found to be of great political advantage when the Laitayok were given a headman of their own. In the course of this survey, only one other clan concentration was discovered, namely the Laitayok at Enganumet, where this clan forms two-thirds of the total population. Local government can, therefore, be given a strong clan bias in that area, and in other areas which may be found in future to contain large numbers of a single clan.

614 The feeling that the clan owns jointly all cattle in possession of the
922 clansmen manifests itself in numerous ways. For instance, members of the Engidong clan are not supposed to contribute to the cattle taken by deputations to the laibon — himself an Engidong — but may add a
499 present of their own. When blood-money is paid, it is less when the

9:Fosbrooke G-5 .(1936-1948) 1948 FL12 Masai FL12
Kisonko

and alien children; the latter frequently come to be regarded as tribesmen by this process. 597

First of all a Masai adopts any child born to his wife by anyone other than himself, including those born prior to marriage: in fact a betrothed girl is frequently left in her father's boma until she bears a child. The child of one's own loins is called *oiunóto*, that of another *engera oilaitalak*. No distinction is made between the two, and the latter term is generally used playfully. [192]

If a man has one wife with a number of children, and another who is barren, when the former gives birth to another child, there is a ceremony by which the latter may adopt this child. The adopting mother sits on the after-birth, and pays to the true mother a cow and calf called *nongeya*. She takes over the child as her own ,and it is asserted that by stimulation of the breasts and special food, lactation can be artificially induced, even when the foster-mother has never given birth. The fact that a woman has adopted a child in this manner is seldom referred to afterwards — the child is regarded as though she herself had given birth to it.

In the olden days children were frequently captured in war and adopted into the tribe: such a child is referred to as *ol arnoti lembere*. It was, and still is, not uncommon for a Masai to adopt an alien's child; at times this will occur when the Masai marries the alien's daughter and adopts a younger son; or in time of famine amongst aliens, the Masai may find an abandoned child, or be given one to look after; or he may give some cattle to the alien for the privilege of adopting the child. The use of the word 'purchase' has been deliberately avoided, for neither party looks on the transaction in this light. A son acquired in this manner is called *otaberno*. These last two categories of adoptee can inherit the cattle of their foster-mother's house, whilst their children can inherit the 'gate' like any other Masai. 597 727 597

A peculiar custom of adoption exists amongst the Engidong er laibon's clan. Any Masai, child or adult, can attach himself to a member of the clan, and such person must treat him as a son, giving him cattle, and arranging his circumcision and/or marriage. Such a person is called *ol onito*, as also are the numerous Kikuyu received into the clan. The relationship is terminable at will, the adoptee shaving and departing, but leaving behind everything that he has been given. Though theoretically applicable to the whole clan, such adoptions usually only take place in the laibon's immediate family . 597 189

These notes on adoption are by no means full: they may, however, be sufficient to emphasise that it is a mistake to regard the Masai as being racially pure. If they come in time to accept new ideas as readily as they accept new blood, their rapid advancement would be assured. 144

It is important for a number of reasons to know who holds the purse-strings in a Masai family group, but it is a question to which no definite answer can be given. Rules, where they exist, are seldom followed — in such intimate family matters it is personality that counts. 422 593 [193]

The cattle which have been allocated to a woman in trust for her children are nominally in her control. The elder looks after the animal

M 10 233 (ii) *The Masai.*

The Masai are a pastoral tribe whose sole occupation is the tending of large herds of cattle, sheep and goats. It has been estimated that they have about 25 head of cattle, and twice as many sheep and goats, per head of the population.

M 262 261 [265] The staple articles of diet are meat, milk, and blood. The blood is drawn from the living animal by puncture of the jugular vein with an arrow. Various roots and barks are used to make infusions which are used either with boiled meat or with milk. The men, while in the "moran," or warrior class, subsist practically entirely on these articles of diet. The rest of the population, in addition to these four items, which form the main part of their food, eat also some bananas, beans, millet, arrowroot, maize, sugar and honey, as these are available. The use of maize, which was introduced only a few years ago, is increasing.

M [177]

For the greater part of the year there is no scarcity of meat, blood and milk, but in periods of severe drought, when, in spite of the large herds, the milk supply is inadequate, the consumption of these vegetable foods is increased, and even the "moran" may be compelled to supplement their meat and milk diet.

M [484] [843] [146] Berries are eaten by the warriors when on safari, *i.e.*, on hunting or fighting expeditions. It appears also to be customary to send the pregnant women into the bush to eat berries. The berries would make an insignificant contribution to the main constituents of the diet, but it is probable that they are of considerable importance as an antacid dietic addition.

M [184] One section of the tribe, the Loitokitok, have adopted a frankly mixed diet. It is of interest that pica among the Masai is confined to this section, who use edible earths from various sources with their vegetable foods.

(*b*) Chemical Composition of Native Foodstuffs, Edible Earths, and Mineral Waters.

Ka M K 146 The results of the chemical analysis of 153 samples of substances used in the dietary of the two tribes are given in Appendix I. Certain points of interest are discussed below.

(i) *Foodstuffs.*

164

It appears at once that the incidence of yaws, malaria, helminthiasis and ulcers is higher amongst the Kikuyu, while, on the other hand, the occurrence of chronic constipation and arthritis is more frequent amongst the Masai. Pulmonary disease appears to be somewhat more frequent amongst the Kikuyu, especially in the in-patients.

It is obvious, however, that hospital statistics cannot truly represent the general incidence of disease in a native tribe. For this reason an attempt was made by the field worker to estimate the proportions of the diseases encountered most frequently in the course of his survey. Altogether, about 12,000 natives of both tribes were seen. Of those who attended for medical treatment, a large number in both tribes required dental extractions, and many were cases of local injury and conjunctivitis. Conjunctivitis is very common amongst the Kikuyu, especially the women, and less common amongst the Masai. The following table indicates approximately the incidence of the most common diseases in the two tribes (as percentages of the total number of cases of these diseases encountered in each tribe) :—

	Kikuyu.	Masai.
Bronchitis	28	4
Pneumonia..	3	—
Tuberculosis	6	1
Ulcers	33	3
Malaria	18	2
Gonorrhœa..	1	8
Intestinal stasis	4	45
Arthritis	2	35
Helminthiasis	5	2

With the exception of pulmonary conditions, this estimate is in good agreement with the hospital data. As regards pulmonary disease, the field worker's estimate is 37 per cent. for the Kikuyu and 5 per cent. for the Masai, while the hospital statistics (calculated on the same basis) show 34 per cent. in Kikuyu and 27 per cent. in Masai. Different possible explanations might be offered for the high figure from the Masai hospital. We have already noted that 20 per cent. of the patients at this hospital are not Masai. The figure for pulmonary disease might possibly be altered to some extent by exclusion of natives other than Masai. Again, we have no information as to possible dietary and environmental differences between Masai living in the neighbourhood of Narok as compared with the more remote parts of the Reserve. In this connection it is of interest to note that Masai prisoners in Nairobi Gaol appear to be particularly susceptible to pulmonary infections (Ann. Med. Rep. Kenya, 1923). It might be thought that their susceptibility is increased by the drastic change in diet and environment to which they are subjected in gaol. It is obvious, in any case, from this observation, that the Masai have

Kenya

are often called *I-Sipolio* or *'Laibartan* (*see* Hollis, p. 298, Pl. XIX). They shoot at girls with wax-headed arrows, and a girl who is shot must then give the novice a ring, which is usually, if not always, of a special type, being very much curled and twisted. The novices must observe the following rules :— [56] [178] [301]

They must enter the village before the cattle every evening.

Must not drink blood or cut meat or touch it with the hand.

Must not wash.

Must not have sexual intercourse with girls (this is not kept strictly).

Must not fight or be struck by anyone. Anyone who strikes a novice must put milk on his head.

Must not go out in the day time without the head-dress of stuffed birds.

O-Singolio, plur. *I-Singolion*, is the general word for any dance. (Cf., p. 191.) [535] [192]

Warriorhood.—The Age-group system plays such a large part in the tribal organization that I will deal with it in detail.

A right-side circumcision is called *E-Murata e tatene* = the circumcision of right. A left-side circumcision is *E-Murata e kelyanye* = the circumcision of left.[1]

Each of these groups is called *Ol poror*, an age-group. Each age-group takes a temporary name soon after circumcision and receives a new one at its *E-Unoto* ceremony. For example, the present age of Purko warriors was called *Il-Tiegi* prior to their *E-Unoto*, when they took the name of *Il-Salaash*.

A right and a left age-group together form a larger group, which I shall refer to as a generation in contradistinction to an age. The term for a generation is *Ol aji*, but it is also often loosely designated as *Ol poror*.

Speaking generally, each section has a different name for its warrior age-groups. The exceptions are (*a*) Loita and Siria. (*b*) Kabutei, 'L Odokilani and Matapato, who respectively share a single *E-Unoto* ceremony and therefore have age-names common to their respective groups.

The generation names emanate from the Kissongo in Tanganyika Territory and are common to all the Masai. They are given soon after the warriors of the combined ages have become elders. Thereafter the age-names tend to fall into disuse and be replaced by the generation-name. [184] [552]

A large number of names is given in Hollis, p. 263, but forms an indiscriminate mixture of age- and generation-names.

In the following table I have confined myself to names in everyday use in order to avoid errors and make for simplicity.[2] It will be noted that several sections do not have a left-side circumcision. In the remaining sections the right side is more popular than the left.

[1] I do not know the origin of the terms "right" and "left."

[2] For other generation-names *see* History, *infra*.

13:Huntingford E-4 (no date) 1953 FL12 Masai FL12
Agricultural Masai

439 whose warlike qualities appeal to the Masai. Honey, honey-wine, and ivory are got from the Dorobo. Ivory was used in the old days for trading with the Swahili caravans for cloth, beads, wire, and so forth. Trade outside Masailand is conducted [126] mostly by the women, for by mutual arrangement they were allowed to pass unharmed from tribe to tribe even during the progress of a war.

Hunting

224 Though the Masai do not hunt habitually, and despise those who do, they used occasionally to kill wild animals—elephants for their tusks, buffalo and eland for the meat and hides, ostriches for their feathers, and lion and leopard to protect their cattle.

Labour

461 Although deprived of their only real occupation, fighting, the Masai have not yet as a people accepted any substitute for it, being, as Sandford noted, " too proud to work," i.e., for wages. A small number have accepted employment as herdsmen on farms, and some have done good service in the Police and K.A.R., though even in a military capacity most of them are still unwilling to submit to a form of discipline that is not their own. Though a few have taken to cultivation, the majority have not yet consented to stoop to what they consider labour unworthy of a Masai.

THE AGRICULTURAL MASAI

101 The agricultural Masai, the I-Lumpua (Lumbwa) and Il-Oikop of former days, 175 are people of Masai stock who, having lost their cattle through disease or defeat, were forced to take up agriculture in order to survive, and by so doing earned the [178] lasting contempt of the pastoral Masai. It is in most cases uncertain how long the various groups of Il-Oikop have been agriculturalists; some of the southern Masai, for example, were defeated by the Gogo early in the 19th century and took to agriculture. Fischer in 1882 reported groups of " Wakuavi," as he called them, living on the southern edge of the Mau; at Ndaseriani (Ndare serian), 15 miles south-west of Narosura; in the region known as Nguruman (*in-kurman*, " the farms ") for about 30 miles north of Lake Natron; at the southern foot of Mt. Meru; and at Kahe.[8] Von Höhnel adds Ndasekera, 20 miles north-west of Lake Natron.[9] Another group is named by Thomson and von Höhnel[10] at Taveta; while the map in Hollis's *The Masai* shows them as extending for about 100 miles south-south-east of Lake Manyara. The best known, however, are the northern group called Il-Tiamus or En-jemusi (Njemps) near Lake Baringo, concerning whom we have (such as it is) the fullest information.

184 With the exception of the Taveta group, the agricultural Masai in general resemble the pastoral Masai in appearance, dress, and general culture, and though 22 they cultivate the ground, still have the acquisition of cattle as their chief ambition. Those of Taveta have mingled with the Taveta,[11] and have become the most successful cultivators among the Masai; the rest of the agricultural Masai in the days of Thomson and Teleki grew mainly eleusine and millet, while the Il-Tiamus grew also pumpkins, and tried unsuccessfully to grow maize. Most of the agricultural Masai supplemented their diet by hunting, bee-keeping, and, where possible, by fishing.

13:Huntingford E-4 (no date) 1953 FL12 Masai FL12
Agricultural Masai

In 1932 the Il-Tiamus numbered about 2,250 (3,423 according to the 1948 Census), and though they are of Masai stock, being descended from a Sambur section called Il-Doigio, they have admitted a variety of refugees including Kamasya, and become rather mixed. According to von Höhnel they had originally four villages at the south end of Lake Baringo, but two were deserted on account of Masai and Suk raids, and some of the inhabitants, having lost all their cattle, took refuge on Kokua Island in Lake Baringo. They are expert swimmers and possess canoes, though von Höhnel saw none in 1887. Their dwellings are round huts with rather high-pitched and somewhat convex thatched roofs, and walls of posts and sticks. These are crowded into two permanent villages known as "Njemps Kubwa" and "Njemps Ndogo" in the Tigrish valley a few miles south of Lake Baringo; the closely packed huts almost touch each other, and the mud-walled granaries are surrounded by strong palisades.

In general the Il-Tiamus keep as close as they can to the dress and customs of the pastoral Masai; they have circumcision and *eunoto* and other ceremonies, and practise the "free-love" system of the pastoralists, though without the *manyatas*. Today they have some 180,000 acres of poor land, most of it unfit for cultivation; but they have acquired, since the establishment of British rule, some 12,000 or more head of cattle, and 30,000 goats and sheep, thus achieving in part the ambition of all Il-Oikop to become cattle people again. In the time of Thomson and Teleki, however, Njemps was an important station on the caravan route, and von Höhnel noted that they had a large extent of cultivated land. This was divided into blocks (he says of three to four miles square) which were intersected by irrigation channels bringing water from dams across the river Tigrish. This system was still working in Dundas's time, who says that the opening of the main ditch was performed with the sacrifice of a sheep at the mouth of the ditch.[12] Besides agriculture, the Il-Tiamus fished and hunted, using the bow, and spears of Suk and Turkana types.

It is possible that the fishing group called Il-Molo who live on the east shore of Lake Rudolf is to be classed as Il-Oikop.[13] They subsist on a diet of fish alone which, when Teleki and von Höhnel saw them in 1888, had produced no ill-effects; but it seems now to have resulted in considerable physical degeneration, and in the appearance of rickets in all members of the group. There seems to be a good deal of Gelaba blood in them.

The Il-Arusa round Mount Meru are a large tribe of agricultural Masai, originally of Bantu stock, but now accepted by the pastoral Masai as worthy of recognition as a group which can pay and receive cattle for compensation in cases of homicide. The Baraguyu in Southern Masailand are also to be classed as agricultural Masai.[14]

SOCIAL ORGANIZATION AND POLITICAL STRUCTURE

Social Organization

Life Cycle

From birth to circumcision a male is a boy, *ol-ayioni*. At circumcision[15] he enters an age-set and becomes a warrior, *ol-murrani*, "one who is circumcised," and may associate with unmarried girls. At the *ol-gesher* ceremony he becomes an elder, *ol-moruo*. Warriors may marry when they become senior warriors. After the *ol-gesher* the newly made elders attend to their family concerns, and get wives

[12] K. R. Dundas, *JRAI*, XL, pp. 49–55.

[13] W. S. Dyson and V. E. Fuchs, "The Elmolo," *JRAI*, 1937, LXVII, p. 327; von Höhnel, II, pp. 138–40.

[14] The people known as WaMeru in northern Tanganyika are not Masai, but people of Bantu stock who have imitated them.

[15] There is some uncertainty as to the age at which boys are circumcised. Hollis gives the limits as 13–17 years; Fosbrooke gives the lower limit as 16 or 17.

13:Huntingford E-4 (no date) 1953 FL12 Masai FL12

POLITICAL STRUCTURE

Land Divisions and Authorities

The basic unit of a tribe, *ol-osho*, is the *sirit* or warrior company in its *manyata*, for it represents a district from which a given number of fighting men is drawn; and within this district are also the kraals, *enk-ay*, of the elders. The formation of an *enk-ay* varies. It may contain a group of men who continue as elders the association which they began as warriors in the *manyata*; or it may be a casual grouping which can break up and re-group; and it may contain anything from one to 10 gates. Within the *enk-ay* a rudimentary council seems to exist with one of the elders at its head; it may be no more than the heads of families sitting together and talking. Such as it is, it corresponds to some extent to the Nandi *kokuet*, though its powers and sphere are smaller. But it differs also in an important respect. All the inhabitants of a Nandi parish, including the warriors, come under the jurisdiction of the *kokuet*, whereas in the Masai system the local warrior company has its own authority, the *ol-aiguenani*, who is responsible for the maintenance of both military discipline and "civil law" within his company, and his warriors appear to be independent of the elders' councils. When the age-set has passed out of the warrior stage, the *ol-aiguenani* remains its authority. A number of *sirit*-districts forms the larger unit, *ol-osho*, which English writers call the section or division, the latter being the word used by Sandford. Each of these *il-oshon* has a council of elders which corresponds in some respects to the Nandi *pororiet* council; and, as will be seen from p. 11 above, the *il-oshon* are associated either in loose confederacies with a group-name, like Il-Purko, Il-Damat, and Il-Keek-o-nyokie, which together form the Il-Kinopop, or in distinct "tribes" like Il-Aikipiak, Sambur. The organization of the Sambur seems to have developed on slightly different lines from the rest of the Masai.[39] The *enk-ay* is the homestead of one elder and his wives and children; a number of such homesteads forms a local group with a council of elders, and the total number of local groups is divided among eight sections called *il-mareita* (sing. *ol-marei*), each with a council made up of the leaders of the component group-councils. These *il-mareita* are divided into two large sections with "cattle-names": the Il-oo-rook-kishu, "the black cattle," contains the *il-mareita* of Lo-l-pusin-kishu, Lo-l-ŋuesi, Ol-masila, and Nyaparai; and the Il-oo-ibor-kishu, "the white cattle," contains the sections called Il-oo-rook-kishu, Lo-l-kumai, Lo-l-musii, and Lo-ŋeli.

The most important figure in Masai organization is the *ol-aiguenani*, whose duties in the past were to make the practical arrangements for war, to control the distribution of the loot, to settle disputes when appealed to, to lead his men in war, and to maintain liaison between his company and the laibon on the one hand, and between his company and other companies on the other. But he could resign if displeased with his men, who in turn could dismiss him if not satisfied with his actions. Now that there is no more organized warfare, the duties of the *ol-aiguenani* are mainly confined to the suppression of raiding, in which his effectiveness depends on his character, influence, and disposition; and to settling disputes, in which he is assisted by the elders of the district. Thus a council system with an elected leader has developed out of the older structure in which the *e-manyata* and *enk-ay* were semi-independent bodies. As among the Nandi, it is the personality of the *ol-aiguenani* and the force of public opinion that compel obedience to him. But the whole Masai system is less clear-cut than even that of the Nandi, in spite of the apparent definiteness of the *ol-aiguenani*; though in certain respects he is analogous to the Aba Boku or age-set ruler of the Galla, who is the tribal ruler for a period of eight years.

The Laibon

The laibon, a word anglicized from *ol-oiboni*, pl. *il-oibonok*, and derived from *a-ibon*, "to make 'medicine,'" is a ritual expert who practises divination and rain-making, cures illness, provides charms, and foretells the future. Fosbrooke divides

Kwafi
Dorobo FL6

/7/

M 174 In three mighty corps that followed one another at long intervals, the Masai people came from the north drawn toward the
D 174 equator. The long separation from one another in space and time, their different length of residence in the new East African homeland, and the different shaping of their fate conditioned by that make them appear to us today as three branches of the Masai people.

D 174 The remnants of the earliest immigrant band are the Asá, more generally known under the name of Wandorobo /Wandorobbo/ (a
[101] Bantu formation from the Masai word El dorobo = the poor), of whom they form only a part.

D [233] Although the tradition of the Asá has nothing to say about a former possession of livestock, one must nevertheless assume, especially on the basis of their ethnography, that they immigrated as stock-raising nomads and, as such, took possession of large parts
D [648] of the steppes. Wars among themselves, livestock epidemics, and, finally, the pressure by the Tatoga weakened the Asá to such an extent that it was easy for the second band of Masai, the El kuafi, the first sections of which were the El lumbua, and the later ones the El muli, when it came in, to drive out the ruined ones altogether. A part of them found refuge among the neighboring agri-
D [224] culturalists, with whom they merged, another part among their
[735] oppressors, who adopted them as members of the tribe; the rest, however, withdrew into the forests and bush of the steppes, where still today, in great poverty, they make a poor living by hunting.

M 174 The fate of the Asá, however, was not to be spared the El kuafi either. After a rather long period during which they com-
• 184 peted with the Tatoga for dominion in the steppes, the rinderpest
648 appeared again several times and, as before, brought poverty and
[731] death. And again, as before, the one misfortune did not remain alone. The third band, the El māsai (sing. ol māsanī), immigrated here from the north, and it looked as though it would rapidly complete, by means of bloody fighting, the destructive work of the epidemics. But the presence of the Tatoga, who in places were just as powerful as they were feared, diverted the bellicosity of the Masai. They joined the El kuafi for the common fight against the former.

/7 cont./

000 against the former. The El kuafi recognized the chief (ol oiboni)
174 of the Masai as also their own and seem for a long time to have
184 been on the best of terms with them. Then -- so the tradition
669 tells -- a girl named Matangó, from the family of the ol oiboni
619 Sitonik -- she is usually designated as his sister, more rarely as
726 his aunt -- took a fancy to a member of a legation of El kuafi
[173] warriors sent to Sitonik and went away with her lover. When she bore him a son, the El kuafi proclaimed him their ol oiboni and at the same time refused to obey Sitonik. With this the wars began between Masai and El kuafi. They lasted -- so it seems -- the entire first half of the nineteenth century and occurred sporadically even in the second half of it. One of the decisive battles was at Kisongo, a six-hour march west of Meruberg /Mt. Meru/, where later on the chiefs of the Masai took up their permanent /8/ residence. The ones driven away went into the rugged forests of
[466] Meruberg, where they lived for a long time in constant strife with the Masai, until the chief Mbatyan completely subjugated them and forced them into compulsory service. Other battles took place near Ngurumán, north of Lake Natron; the rest of those conquered still live there, mixed with Wasegedju from nearby Sonjo. The
[361] remnants of the ones defeated in the Serengeti steppe are still to be found in Taveta, Kahe, Aruscha-tschini. The first battles between Masai and El kuafi probably took place in the vicinity of Kenia /Mt. Kenya/, and led to making the latter sedentary.

One of the last great clashes was in the steppe area Sogonoi; the ones conquered fled to Ngujuka and then farther to Useguha and Mahga, where they founded a settlement under the chief 'Lemá.

174 The Masai took a few individuals from among the defeated
184 into their community. The rest split up. One -- larger -- part
619 became sedentary and formed some colonies in the vicinity of
[361] foreign tribes or merged with other tribes. Another -- smaller --
[721] part at first made a living for a time from hunting, until it
[231] succeeded, by means of raids against sedentary peoples, in coming
[101] into the possession of livestock again. Today they again live wholly as before and are distinguished from the Masai only by

M 174 184 619 [101] [361] /8 cont./
the name El muli. Those who became sedentary, however, are designated by the Masai as El lumbua and also as El kuafi -- probably because they constitute the main part of the old El kuafi. The caravan people, accordingly, call them Wakuafi, while they make no difference between El muli and Masai and even impose on the former the name of the latter.

M [144]
In contrast to the El muli, who have remained pure, the El lumbua of all the settlements are more or less strongly mixed. In places the degree of mixture is so great that at first glance one scarcely recognizes the somatic features characteristic of the Masai people; in places, however, it is also still so slight that any mixture at all can only be determined by thorough investigation.

D 174 M 174 184
A last group,[1] finally, became hunters, the El asiti. This is the second branch of the Wanderôbo; the third and most recent, the El gasurek, arose from the Masai themselves, in that those impoverished by livestock epidemics were forced to a new means of subsistence.

M 634 635 [648]
Even up to 17 years ago the Masai were the lords of the vast steppes in German and British East Africa, when the European occupation brought about a change. The entire land inhabited by them is divided into three provinces. The Kisoñgo Province embraces those steppe regions that lie south of the line, extending east-west, connecting the peaks of Kilimandscharo and Meru. North of this lies the province of Loita, and still farther north, embracing the region of Lake Naiwascha, the province of Ol bruggo. In earlier times a part of Loita called Es sereñget seems /9/ to have temporarily formed a province by itself. Each province (ol oscho 'bo = a province) is divided into districts (eñ gob = the land), and these again into areas. Most of their names are proper names that can not be translated; others are chosen from local peculiarities, for example, springs, brooks, hills, mountains, trees, etc. The inhabitants often name themselves after the individual provinces or districts and then speak of Kisoñgo-Masai, Loita-Masai, Sereñgeti- or even Kiteto-, Moibo-, Sogonoi-Masai, etc. Earlier travelers often mistakenly took this designation for tribal names. Similarly, the word ol oikob has been misinterpreted,

M [101]

M 192 101

1. [The reference is to the last group of the original Kwafi--Analyst]

M /9 cont./
192 in that it was taken as a tribal name, and people spoke of ol oikob-
101 Masai and ol oikob-Wakuafi. El oikob (sing. ol oikobani) means killers, rough, brutal persons, and is an invective with which the Wandoróbo, Wakuafi, and the Masai blacksmiths (el konono) designate their oppressors, the Masai. Fischer mistakenly translates the word as "owners of the land"; this, however, would be called: ol opén l eń gob.

M The Wakuafi live in their colonies as more or less peaceful,
619 sedentary cultivators. Wherever they found peaceful neighbors after
184 their defeats, they too became calm. On the other hand, where
181 they remained in close contact with the Masai and were exposed to their constant raids, the old bellicosity remained in them. An example of this is the population of Meruberg /Mt. Meru/ in the
M Great Aruscha /Arusha/ and Meru areas. In spite of a very con-
[144] siderable mixture with Wadschagga from nearby Kilimandscharo, they have completely kept their original character traits. Their
M imperiousness, rapacity, and cunning equal that of the Masai; in
[648] courage, on the other hand, they even surpass them. Their numerous attacks on the camps of Europeans and trade caravans reveal them as brigands. The relationship between Wakuafi and Masai
M is in general not bad. The latter regard the former as fellow tribes-
829 men, even though as inferior ones, because they work the soil
619 and own only a little livestock. They are foes one minute and
[241] friends the next! And both must always reconcile themselves to
[231] each other, for the Masai cannot do without them as suppliers of
[438] vegetable foods, after the rinderpest at the end of the eighties
[731] again raged so destructively among their herds.

D While among the Wakuafi one can still clearly recognize
105 their one-time power and greatness, this is no longer the case at all among the Asá. Most of them, just like the El asiti, timidly and concealed in the bush of the steppes, live in miserable little grass and leaf huts which can be reached only by hidden paths. Their food consists of game, which they kill with poisoned arrows and poisoned javelins, honey, agricultural products which they obtain in barter, various wild berries, roots, and herbs. Where they dwell in the vicinity of the Masai, they live in a certain

D /9 cont./
105 dependency on them. A caravan traveling across the steppes certainly does not remain hidden from the Wandoróbo roaming about everywhere. /10/ Their betrayal soon causes it to fall victim to the spoils-hungry Masai. Through their poverty and the contemptible endeavor to make up for the lack of slaughter animals through
M [829] the killing of game, the Wandoróbo, to be sure, stand especially
[177] low in the estimation of the Masai, yet the latter do not deny the connection with their old fellow tribesmen to the extent that they do not grant individual Wandoróbo, as well as El lumbua and El muli, admission into their community.

M In recent times those Masai who, after the loss of their live-
101 stock, have become detached from the larger community and live
• 184 in small kraals in relative poverty, still generally reckon them-
177 selves as belonging to the El dorobbo, without, however, counting themselves within one of the three branches -- Asá, El asiti, El gasurek. Often they live together with a few Wakuafi, sometimes one also finds one or several Wandorobo families among them. Their property consists of a few cows and donkeys, a couple of goats and sheep. Since they cannot subsist on these, they also cultivate maize, batatas, etc. here and there and devote themselves to hunting with bow and arrow.

M The influence that the Masai people exerted and still exert
648 on the settled peoples who live on the borders of the steppes dominated by them for centuries is very great. Just as formerly it was the Wandoróbo, now it is the Wakuafi and Masai to whose influence the surrounding peoples must submit. What qualified
M the Masai for this lordly position is their relatively high cultural
[181] level; what made possible their reaching this position, their strict organization and their war-mindedness. This is not the place to analyze why the culture of the Masai is a higher one than that of
000 individual Negroes surrounding them. It should only be pointed out that among almost all of these, in contrast to the former,

D 197 /15 cont./
the El asiti also have their own idiom, which will be briefly discussed at a later place.

M 197 802 184 D 197 802 D M 771 304 619 [191] D M 174 619 [844] [196] D M 614 613 D M 128 Corresponding to the uniformity in language, the number words are the same among the Masai and Wakuafi, whereas the Asá and El asiti have their own words for only a few numbers, but in general always make use of the ones used by the other two branches. One finds a complete correspondence for all three branches in their religious view, and the manner of circumcision customary among both sexes. The peculiar circumcision of the boys is practiced by no other people at all, with the exception of one lineage of the Tatoga, closely related to the Masai people. In birth and death, too, all three have the same customs, while in the rest of their customs one finds only unessential differences which are based solely on the difference in their external way of life. The most striking proof for the three branches' belonging together, however, lies in their descent.

The people as a whole are divided into three large tribes, the 'L aiser, the El mulelyan, and the El mengana, each of which is made up of a number of lineages, and every Asá, as well as every Ol kuafi and Ol massani, is a representative of one of these lineages.

If we now concern ourselves further with the ethnography of the Masai in particular, which is at the same time that of the Wakuafi, we are thereby including the ethnographic traits of the entire peoples the stressing of individual differences that have developed among the Wandorobo in the course of time and under the influence of changed conditions will be reserved for the third part.

000 Tribes, lineages, sublineages. -- The En gidon lineage. -- The chief: his rule and policy, magic medicines, genealogical tree, village, ceremonies, foods. -- The sorcerers. -- The El kiborōn lineage. -- The rainmakers.

M 614 613 Every tribe (en gischomi) is divided, as has already been mentioned, into a number of lineages (ol gelata, el gelat). Among these, in turn, one distinguishes principal lineages (ol gelata kitok)

/79 cont./

714 which only the brave are entitled to wear, the os serata l el kigeloni.
531 A shield emblem is complete if, in addition to the ornamental band, it also contains the red warrior-emblem.

The ornamental band is the stripe painted in the longitudinal diameter of the shield. Actually es segira is the name of the cowrie shells that, sewed on leather strips, adorn the gourd bottles. The similarity of such an ornamental band with the longitudinal stripe on the surface of the shield explains the Masai word used for this and my translation as ornamental band. The drawing of the ornamental band is unimportant and is often subject to the taste of the moment. Considerable differences exist both between the provinces and within the individual ones.

714 The most important emblem on the shield of the warriors is the
531 red warrior-emblem. Three forms of it are distinguished: the
634 double wedge (Plate 1: Figs. 2, 4, 6, 9, 13, 14, 15, 17) along the
184 ornamental band belongs to Kisoñgo Province, the segments of circles (Plate 1: Figs. 5, 7, 10, 18) on the ornamental band are the emblem for Loita Province, and the peripheral emblem (Plate 1: Figs. 11, 12, 16) shows that the bearer of such a shield belongs to Ol bruggo Province. The warrior emblem is either on both halves of the shield or only on one; the former is the rule in Ol bruggo and Loita, the latter /80/ in Kisongo. Loita and Kisongo, however, show more exceptions. If the red emblem is painted on both halves of the shield, the one half shows the mirror image of the other, so that a symmetrical double emblem results, the center line of which is formed by the ornamental band. According to my explorations, this seems to have been the fashion especially after booty-rich war expeditions. On the other hand, where the red emblem is found on only one side, the other half of the shield shows one or two large, black, bow-shaped emblems
714 (Plate 1: Figs. 2, 3, 5, 13, 15, 17, 18). These are commonly
531 found in Kisoñgo, where they have been customary for as long as the
634 memory of the people extends. They are rarer in Loita /Ill. 29 ap-
184 pears here/ and, to be sure, really only since the death of Mbatyan.
174 Mbatyan resides in Kisongo, and his bodyguard consisted of Kisongo
791 warriors. After his death Zendeo put together a guard made up of Loita warriors and also stayed largely in Loita in order to avoid the

/80 cont./

411

Ill. 29. Shield escutcheons of the Masai.

714 influence of the Moschi military station better. The answer to the
531 question concerning the meaning of the black bows was almost always
634 merely that they probably served as ornamentation, since, with the
184 application of the warrior emblem on the one side, the other half
791 of the shield would look unattractively empty, and only a few old men
174 opined that it was originally a lineage emblem of the En gidoñ. This conception seems to me the right one, and it would explain why the emblem /81/ has been commonly used in Kisongo from time immemorial and then also came to Loita after Mbatyan's death.

714 The lineage emblem is almost never found on the shields of
531 today; thus I did not come across it until I had drawn by a number of
613 old men the shield escutcheons carried by them in their youth. The illustrations of Plate 2[1] show a collection of lineage emblems. We see there that the emblem is sometimes applied on the front of the shield surface, sometimes on the back of the shield. While the
[561] warrior emblems have remained the same for a long time, the lineage emblems were always quite variable, and it seems that each age class made up its own.

1. [See p. 608--Analyst]

among the others usually more spade-shaped (c). The first two
[177] shapes, especially the spoon-shaped one, have in more recent
times also been imitated by Negro smiths, and, to be sure, as I
/130/ was able to determine in several cases, on the express
[184] order of Masai warriors. While the spear shoe is circular above
{422} and below as a rule, one also finds such, particularly in the Ol
bruggo province, among which these parts have a rectangular
diameter and one which notches (Fig. 30) are made as owner-
ship marks of various meanings (1).

1. They may mean: district, ol boror, tribe or lineage, etc., of the owner.

/Figs. 30-32 appear here./

411
482 On the march the spear is carried, either on the right or on the
left, in three different ways, among which the warrior alternates
according to convenience. 1. With outstretched arm hanging
down, the hand grasps the spear shaft at the spear's center of gravity.
The spear lies horizontally, the tip /131/ directed forward and
slightly outward. 2. The spear is carried in the arm, similar to
the position of the "gun in the arm." With thumb, index finger,
and middle finger the spear shoe is grasped in the middle, as one

411

Fig. 36. (1/10)

Spear, sword, shield, and club are the weapons of the warriors. [887] [714] Old people never carry the shield, rarely a small, to some extent cast-off spear, or an old sword, but for the most part only club and bow with arrows. They need bows and poisoned arrows for the defense of their own kraal or against predatory animals. The Masai [184] [224] impoverished through cattle epidemics, who live apart from the others and erroneously call themselves el dorobo, also hunt game with them. The bows (Fig. 36) are two-shanked, simply curved,

/197 cont./

844 as practicable and useful in and of itself, but understandably fear doing more harm than good with it because of the impossibility of observing the necessary cleanliness. Deeper, internal, manual and operative intervention to facilitate or to make possible the child's emergence does not seem to be practiced anywhere. Support of the perineum to prevent tears does not take place, but the opening of the vulva is not infrequently enlarged by a small incision above or by one above and below, in order to prevent tearing of the entire perineum.

845 One stands helpless when confronted by a pelvic narrowness
• 184 obstructing the birth. Mother and child succumb to it. Although this situation practically never occurs among the Masai living in the tribe, it was often observed among those living in the European settlements, and, to be sure, the pelvic narrowness was always
[582] because the woman was too young. These last Masai, in the manner of the coastal people, and in contrast to the former, marry very young, and since the woman must always be considerably younger than the man and, on the other hand, the choice of girls is limited, it not infrequently happens that the latter, upon entering marriage, though sexually mature, nevertheless do not yet have a fully adult skeleton. This phenomenon, not infrequent among primitive peoples, must perhaps in general, and in this instance in particular, be traced back to premature sexual intercourse and, because of that, premature menstruation.

844 During the birth act the woman giving birth adopts either a position "on all fours," similar to the knee-elbow position, or a sitting one, in the latter of which she plants her bent legs against hut posts and leans herself against a hut pole, which she grasps with her hands above her head. The first position is probably the most widespread. Two women standing beside the woman giving birth, to the right and left, holding her by the shoulders, seem to be trying to hold her suspended. In front of this group, with her head under the woman giving birth, crouches the midwife, in order to receive the child.

"As soon as the head and one shoulder are born," an eh gaitoijoni expressed herself, "the rest follows by itself; only rarely is it necessary

/197 cont./

844 that I give a gentle tug with a hooklike insertion of the index finger into the armpit of the child."

/198/ In order to hasten the exit of the afterbirth, one of the assisting women tries to promote labor-pain activity by tickling with a feather the palate of the woman giving birth. This manipulation is also used in rare cases during the periods of the preliminary and of the actual labor pains. During the afterbirth period the child's umbilical cord is removed, in that the umbilical cord (ou ematu) is first tied close to the body with a cord of bark bast and then cut at a place an inch away from the body with the instrument otherwise serving as a razor, the ol moromja. A naval bandage is unknown. The afterbirth, which is not the object of superstitious customs, is [184] tossed into the livestock kraal by the midwife in some districts, buried [illegible]

The newborn child is cleaned by a rubbing with liquid fat. According to statements of the people, this treatment, however, is supposed to represent not so much a cleaning as a strengthening and comfort. Then the child is laid beside its mother on a soft leather skin freshly greased. As soon as the latter has recovered from the 846 birth act, the chews four grains of ol odos (blaesa lanceolata) and [824] gives the child an extract of these as a purgative. On the following [57] day the newborn child is given its first bath, consisting of a tepid [751] extract of the twigs of eñ gairetuai (Physalis minima L.) and the stalks of eig aitetoijai (Commelina spec.), to which is ascribed the action of a protective magic against sickness. Cold baths, say, for the purpose of hardening, are unknown. The child remains unclothed.

846 The woman in childbed leaves her hut as a rule as soon as her 757 condition permits, which is usually already the case on the following day. Her medicinal treatment consists first of all in the administration of laxatives, for which in this case a mixture made out of liquid fat, honey, steppe salt, and a few pounded ol odos corns, as well as a leaf infusion of os sitetí (Grewia bicolor Juss.), is especially prized. Furthermore, she is given a beef soup seasoned with ol oliale bark (Colubrina asiatica Brongn.), as well as a decoction of ol gabere l e gemma (Sphaeranthus microcephalus), a leafy swamp plant, or a leaf infusion of ol edawi (Epaltes gariepina) or also a decoction of

/306 cont./

821 light. The cubes minor and major /the two Magellanic Clouds/ are
[976] two lakes from which the cattle of 'Ng ai drink. The Pleiades
(k galwa), though their rising in the west, announce the onset of
the great rainy season named after them. In Orion λ and the two
small stars beside it form a constellation called 'k galia = the
widows. The stars λ, ο, ζ, θ and the two small stars on a line with
it form another constellation. In it λ, ο and ζ are three ai nurse
who are about to marry three widows. /307/ This constellation is
called 'k gaziak = the remarried widows, in contrast to the three
[976] 'k galia, who stand alone. The two large stars in Centaurus (ai
ungu) and the four principal stars in the Southern Cross are boys who
tend the cattle of 'Ng ai, which are represented by the small stars of
[787] the Milky Way. A ring around the sun or moon heralds rain. For
[illegible] ing rich spoils. Just as sun and moon have made a breakfast themselves, so will the warriors on their way have to lay out such a one for the captured livestock (1).

[823]

1. For the cardinal points (a' lahai Ng ai = the sides of God) the Maasai have the following names: North = Kipeldi or Kipeldi, which also designates the land of the original home. South = a' mijani, i.e., the battle; it is the direction in which the Maasai travelling south always had to endure new battles against the long-settled ai ngg. East = englaimunto ang ainé = the sun rises. West = endarumto ang aiun = the sun sets.

782 In case of disease, danger, sickness, or other calamities, all the people pray to God. Otherwise the men say a prayer mostly only on special occasions, whereas the women pray daily, mornings and
[184] evenings. Children do not pray at all in some districts, in others only the girls pray, and in still others all children learn it at the age of
[823] six to eight, usually through their mother. In praying, one turns the face to the north, or in the morning toward the rising sun and in the

671 An awareness and understanding of justice are very little developed among the Masai. Therefore only a small number of customary
• [184] legal provisions exist, which are by no means uniform for all Masai, but rather often enough vary in the different districts. As nomads,
[141] among whom individual families frequently live alone or with their closest relatives in a kraal, by themselves, without having neighbors in the larger vicinity, they make do with fewer laws than another tribe whose sedentary members are supposed to live within definite fixed limits in permanent order and peace. Furthermore, the nomadic life in and of itself leads to a freer conception of life, which opposes vassalage through laws and often prefers to let might
[313] come before right. But in order to understand the great inconsis-
[149] tency in individual legal decisions, one must above all take into
[144] consideration the feeling of solidarity, which is strongest in the family and always still strong enough in the tribe to arouse from the few great prejudice against anyone who does not belong to the
593 tribe. The questions concerning family and personal rights have

/214 cont./

628 revenge goes first against the murderer or, if he has fled and is not
682 available, against his brother or any man of the family of the
[672] murderer. Usually blood revenge is commuted by composition
[593] (wergild), the amount of which the murderer negotiates with the
avenger through a friend. As a rule it consists of 200-300 cattle --
[613] now fewer in many cases -- which the murderer, together with his
[614] people and his fellow lineage and tribal members living in the
vicinity, that is, in the same district, gather together. The avenger
is free to accept or reject the composition. /215/ Blood revenge is
not carried out longer than one or two months after the murder;
composition then takes its place.

[598] The kraal of the ol oiboni is regarded as a place of refuge. If
the murderer has confessed his deed here, blood revenge may no
longer be carried out on him, though he remains obligated for the
payment of the composition. Murder committed on a married man,
a girl, or a woman is never expiated by blood revenge, but by a fine.
Until the payment of the composition or fine the murderer is called
[326] ol oikobani (pl. el oikob). The murder of a blacksmith is unpunished.
[564] On the other hand, if a blacksmith murders or even only negligently
kills a Masai, a band of Masai consisting of married men, warriors,
and boys immediately sets out to kill several blacksmiths.

682 Negligent homicide is expiated only by fines. These are very
613 minor if the perpetrator and the one killed belong to one lineage.
672 If they belong to different lineages of the same tribe, every male
member of the lineage (warrior, married man) and every married
female member of the lineage must pay a cow. Of this livestock
the brother of the one killed receives one half, while the other half
[614] is distributed equally to his fellow lineage members. The fine is
paid and distributed analogously if perpetrator and victim belong
to different tribes. If a woman kills a man through negligence, she
will also be killed in most districts. On the other hand, if a man
has killed a woman, he either remains unpunished or is given a
682 beating by the brother of the woman killed. In a few districts no
630 distinction is made as to whether the perpetrator acted intentionally
184 or negligently, for example, in Loita, where blood revenge is also
[672] only very rarely used.
[628]

/216 cont./

682 only very rarely used. In these areas the perpetrator, as punishment
634 for the killing or the murder of a man, loses all his property: his
184 livestock, his wives and children pass over to the heir of the deceased.
For killing a woman who has not yet given birth to a child, only half of the livestock of the perpetrator will be given to the widower. For the killing of a woman who has children, the perpetrator pays her husband 19 head of cattle and 19 goats or sheep. In this some distinguished as to whether the woman killed had a son or a daughter: in the former case the fine is greater than in the latter one.

683 Bodily injury with a fatal result is regarded as the same as murder,
[682] as is one that results in the loss of a leg. A person who cuts off another's arm (in some districts this applies only to the right arm) or makes it useless pays the injured one a few head of cattle and later, in case the crippled one is killed in battle, also the fine customary as atonement for murder. It is assumed in this case that the cripple was killed only as a consequence of his inability to fight. Serious injury to the head is atoned for with the payment of a cow, an ox, and a sheep, among others only with the payment of a cow; the fracture of an arm or leg, with the payment of one or two head of cattle. Likewise the fracture or loss of a finger, with /216/ the exception of the two index fingers (*os ngutheni* or *ol onkononi*), which, as magic fingers, are "dangerous and evil." The destruction of an eye remains unpunished. One who tears off another's ear lobe pays him a goat or a sheep for it.

672 One who acts as an accomplice in a crime against life and health is punished in the same way as the perpetrator.

684 Rape, abortion, unnatural lewdness, which is said to occur as
[682] sodomy (1).

1. Cf. the remarkably frequent prohibition in 2nd bk. /Exodus/ 22, 19; 3rd bk. /Leviticus/ 20, 15; 3rd bk. /Leviticus/ 18, 23; 5th bk. /Deuteronomy/ 27, 21.

are not punished.

Third Part

I.

M 184 [179] The Wandombo of the three branches of the Masai people.

The customs of the Wakwafi are in general identical with those of the Masai, and where a slight difference appears in one or another of their colonies, it is to be traced back solely to the influence of the neighboring sedentary Negro tribes. Such deviations are therefore not peculiar to the Masai people as a whole, and a discussion of them would go beyond the compass of the present study. On the other hand, it is necessary to go into more detail on the customs and practice of the Wandombo belonging to the Masai people, who, in their timid seclusion, have maintained themselves quite without foreign influence (1).

M [128]

M D 121 D [179]

1. With the exception of such by the Tatoga, a tribe anthropologically very close to the Masai people.

and to present the differences shown by a comparison with the customs of the Masai, as well as to substantiate the correspondence in the main points.

We have seen that members of all three branches of the Masai people fall under this name (2).

M D 101 184

2. In what follows nothing will be said about the Wandombo not belonging to the Masai people, who are seen, mixed with Tatoga and Masai, as remnants of an extinct Semite people -- who embraced the sun cult.

M D [128]

D 101 The Ará stem from the oldest epoch, the El sotti from the middle one, and the El gamurek from the most recent one (3).

3. The other designations with which the Wandombo of the individual districts name themselves have geographical meaning.

/350 cont./

178 its effect. Hated as faithless and despised as agriculturalists, the
619 sedentary ones are constantly plagued by raids that not only cause
72 them great loss in human lives, but also take away any possibility
[829] for them to arrive at any improvement in their way of life by keeping
livestock for the attainment of the meat and milk diet so necessary
[177] for them. Moreover, the frequent intercourse with sedentary Negroes
[144] and caravan people leads to an increase in the cases of venereal
582 diseases. Premature marriages of girls, which can not happen among
178 the Masai still living as nomads, is not rare among the sedentary
184 ones and often enough leads to the death of the young woman who
165 is scarcely more than a child and whose bony structure, despite her
attained capability to conceive, is not yet developed. Finally, it
178 must still be mentioned that no doubt the longing for the formerly
182 free life in the broad steppes and the feeling of humiliation over
having become a so deeply despised cultivator of the soil oneself
are factors that have a wasting effect. The latter circumstance also
[186] brings with it a decrease of national pride. The barrier that kept
[177] Negroes out of the community of the Masai has fallen. A disadvan-
[144] tageous race mixture hurting the people is slowly taking place.
Among the Wakuafi this process was more rapid in their period. At
[648] that time no European administration prevented their raiding exped-
[72] itions in Negro regions, from which they brought home livestock
and women experienced in agriculture.

177 In frequent -- almost daily -- intercourse that soon springs up
178 and then continues to exist between the Masai who have become
sedentary and the settled Negroes, the Masai naturally also share
in the disadvantages that /351/ come to the Negroes through the
encounter of their lower culture with our higher one.

178 We have seen how many difficulties sedentation brings to the
177 Masai, and it is therefore not surprising that a part of those who
361 have already become sedentary give up their fixed residences again
after repeated failures. These then often join the Wandorobo, to
live by hunting, and call themselves this.

Allowing a three degree F.
*132 average temperature decrease for each 1,000 feet rise in elevation above sea level (Heady, 1960), much of Eastern Masailand would have up to six degrees F. higher average annual temperatures than Western Masailand. Over the greater part of both areas the mean annual rainfall is similar, with Western Masailand receiving roughly 30 inches while Eastern Masailand probably receives some 25 inches (Met. Dept., 1959).

*13 Except for the Rift floor, the vegetation types
*184 and communities in both areas appear to have been much
182 the same (Edwards, 1951:32; Edwards and Bogdan, 1951:3; Heady, 1960:12, et. seq. and his appended map of Grasslands and Potential Grassland Types). However, Eastern Masailand with lower rainfall and higher temperatures would be more vulnerable than the western area to desiccation through human activities, especially overgrazing, overburning, and diversion of water supplies.

As noted above, Western Masailand has been little affected by recent changes in human activity. On the other hand, Eastern Masailand has been intensively modified in the past fifty years or so. Much of Eastern Masailand is easily accessible by road and railway. Nairobi, capital of Kenya, lies at the northern end of Eastern Masailand. Nairobi was started in 1899

*13 as a base camp for construction of the Uganda railway.
182
• 184 Today it is a modern city of about 250,000 people. Spreading south and east from the city along the edge of Masailand are fenced ranches and farms. The Great North (Cape to Cairo) Road runs dustily through Eastern Masailand. Arusha, virtually surrounded by Masailand in northern Tanganyika, is a provincial capital and the center of a flourishing farming district. The provincial headquarters for the Masai Administration in both Tanganyika and Kenya are situated in Eastern Masailand.

The Masai living east of the Rift are from different sections of the tribe than those living to the west, and they are significantly less conservative. Consequently Eastern Masailand has received more ranching schemes, water holes and other projects to "improve" their livestock grazing than Western Masailand, and therefore Eastern Masailand is far more seriously overgrazed. Over much of the area vegetation is impoverished and surface conditions show severe desiccation.

12
*13
*233 It is difficult to obtain quantitative data on the numerical increase in livestock or its impact on the vegetation, since such data from earlier years are not generally available. One area where such data

*136 to most kinds of life, and certainly a barrier to normal wildebeest movements. If this area were less desiccated in previous times, it probably would have been the only point of contact between the eastern and western races of wildebeest. The Roosevelt collections from the Suswa area, however, would indicate that there had not been significant mixing of the races there, implying that any recent contact would have been on a small scale and any significant connection had been in the far past.

*136 • 184 224 *233 182 (262) No wildebeests remain in the northern area of the Rift. There are fenced ranches now south of Lake Naivasha and in the Rift adjoining the Suswa area. The remaining wild animals (kongonis, gazelles, etc.) are hunted on some of these ranches as food for labor. It appears that after the former wildebeest population of this area became isolated from the populations farther west (through Masai overgrazing in the Mosiro area) it was gradually hunted out. Kongonis and Thomson's gazelles are still found in this area.

Summary

*13 121 Masailand is centrally located in the system of grassland belts of Africa. The grassland ecosystems of Masailand are typical of the most biologically productive

*13
121 and most widespread such ecosystems of Africa. While
*13 most African grassland ecosystems, including those of
121 Eastern Masailand, have been modified by changes in
184 human activities, those in Western Masailand have remained largely undisturbed.

*13 Although separated by the Rift, Eastern and Western
12 Masailand were ecologically identical when the first
184 white men arrived less than a century ago. Therefore these two land units provide the "before" and "after" examples, the control situation and the modified one. From this situation one may describe: the factors in operation in the undisturbed ecosystem; those in the disturbed situation; the nature of the changes and the factors involved; and the rates of change.

*13
121 The ecological and topographical barriers around Western Masailand are sufficiently effective that the boundaries of the ecological unit appear to have been essentially the same since prehistoric times.

The study area, therefore, presents an opportunity to study as nearly an undisturbed primitive grassland ecosystem as it is possible to find.

*114 181 and within the century they ruled most of East Africa. To a large degree they have maintained their own free way of life and they haughtily refuse to accept the *114 123 clothes and other trappings of western life. To people coming from crowded and regimented countries there is a much to admire and envy in the Masai. In its more extreme forms this admiration is known in East Africa as Masai-itis.

*114 *13 181 On the other hand, some administrators who must deal with the Masai find frustrating at best their often-complete mistrust and rejection of foreign ideas. Most of those concerned with land use and managment of East Africa's natural resources see the Masai, like the Arab, as the father of the desert and not its son. [123] The strong feelings between those with "Masai-itis" and those with "anti-Masai-itis" are sometimes reflected in their reports and publications.

*114 184 The other factor contributing to confusion about the Masai is the general tendency to regard them as one unified group. Actually there are a number of separate sections of the Masai, some of them pastoral, some agricultural, and some in-between. There are very significant differences in customs involving land use even between adjoining groups of pastoral Masai.

114 Consequently one must specify which Masai he is speaking
184 of, where, and when; it is not valid to generalize about "the Masai."

History

121 Man is the ecological dominant, therefore knowledge of human history of an area is basic to understanding of its ecological history. For this reason I have gone into the history of the Masai in some detail.

174 Before 1800: The early history of the Masai has been discussed by a number of writers. Among the important works are those by Fosbrooke (1948, 1956), Gower (1948), Grant (1954, 1957), Hollis (1905), Leakey (1930), Peters (1891), Sanford (1919), Simon (1962), and Thomson (1885). The following summary is drawn from these writings.

[144] The Masai are considered to be of Nilo-Hamitic stock. It is believed that about 400 years ago they occupied a lowland country north and west of Lake Rudolph in northern Kenya. According to their own traditions they (subsequently) occupied a country called Kieru which must have been the Rift Valley between Lake Rudolph and the Kenya Highlands. This area lies about

175 strongly by many of the Masai involved. Few of those who made the move are still living, but the memory of
175 it is kept alive by the Masai nationalists. The Masai in
181 Kenya's Western Masailand are, or are descended from,
184 those who made the move from Laikipia. They are characteristically more conservative and more distrustful of the government than other groups of Masai, and they attribute these attitudes to the move.

Fosbrooke (1948:11), an admirer of the Masai, attributes the conservatism of the Tanganyika Masai to their hardships from famine, pestilance, civil war, and German administration in this way:

> It is almost impossible to find at the present day an elder who did not go through considerable hardship in his youth. To anyone who has lost and regained a possession, such possession is of greater value, at least sentimentally. The Masai of Tanganyika lost their cattle, their mode of living and their tribal life, and largely by their own efforts have once again regained them. It is suggested that their intense conservatism and resentment of change may perhaps be better understood in the light of the foregoing.

175 During the German period the Masai were
648 largely excluded from the Western Masailand in Tanganyika,
131 although occasional raiding parties came through it. Between 1900 and 1905, according to Grant (1957), there was one Masai encampment or warrior's barracks

*13 648 656 659 Kenya border. The only significant area lost by the Masai was the Moru Kopjes area. This was used occasionally during the dry seasons because of the springs and good grazing found there. By about 1956, however, the last spring appeared to have dried up because of destruction of the vegetation by the Masai.

*13 184 The status of the Masai in Narok District has remained relatively constant compared with that of the Tanganyika Masai to the south. Since 1911 the only changes have been slight enlargements of the area and fluctuations in the land infested with tsetse fly.

*13 648 224 65 The part of Western Masailand immediately to the north of the Serengeti National Park and east of the Siria Escarpment (Fig. 3) is Kenya's finest game area. Following the Second World War part of this area, the triangle formed by the Mara River, the Siria Escarpment, and the Tanganyika border, was made a National Reserve. This action protected the area from hunting but did not affect the Masai. In 1961, due largely to the efforts of Major Temple-Boreham, Senior Game Warden of the area, and Mr. C. Denton, District Commissioner of Narok, an agreement was made between the Narok District African District Council and the Kenya Government to establish a Masai Mara Game Reserve. The reserve covers some 700

595 and so on. The wife is given a specified number of cattle to keep in trust for her son, and she and the children also tend young animals in the herds.

342 These huts are about five feet high and of varying dimensions, but usually roughly square and 10 to 20 feet across. The door is very low. Just inside the door there is normally a baffle wall of loosely woven twigs. Beyond that there are often two or three rooms, each divided from the others by a low open wall of [231] [513] twigs. Young livestock are brought into one of the rooms and the others serve for sleeping and cooking. [352] [354] Usually the beds are platforms of twigs and grass covered by hides. The cooking fire is in a far corner and is very small, normally with three stones around it to support pots. There is no smoke hole in the roof. The outer walls and roof are an open mesh of wattle often interwoven with coarse grass and shrubs. Support comes from larger branches and small logs up to about six inches in diameter. The exterior and walls and roof, and the insides of the door opening are plastered with [184] [462] a mixture of mud, cattle dung, and short grasses. Hut design varies slightly from area to area. Constructing the huts is women's work. Men occasionally help in collecting larger trees and bushes.

Masai FL12

CHAPTER 10

Masai Herds and Mara Lions

I

THE Masai have won respect by their contempt for civilization and all that it has offered them. For half a century Europeans have been tempting them with all the material bribes, indeed even non-material ones, for which every Bantu and Nilotic people is avid. There is scarcely an African of the fat lands who would not sell his soul for a school certificate. The Masai have rejected school certificates with a proud and lofty disdain.

Will a certificate fatten a bullock or swell the belly of a cow? Masai hearts are with their cattle; they desire no finer destiny for a son than to walk in the dust of a larger herd than his father's. The young man who dreams of glory sees fine white bulls and brindled cows and green grass knee-high, he does not see the stone bungalow, the shining motor-car, the well-cut suit, the framed diploma so alluring to his darker fellow-countrymen. He likes to wear his hair in matted pigtails smeared with red ochre and rancid butter, to stand with one foot against the other knee, to eat a compound of bullock's blood and curdled milk, to carry his long spear and to keep his women in their beads and coils and fly-infested mud burrow as his ancestors did—those ancestors whose lion head-dresses and painted shields filled the hearts of lesser breeds with terror, and won the right of conquest over the steppes of eastern Africa from their northern Somali deserts to their southern tsetse bush.

For the Masai have pride, and pride is a quality we recoil from in ourselves and half-admire, half-deplore in others. An Englishman today must stamp with the hob-nail boots of equality upon the little shoots of pride that cannot help but spring up in his heart; but when he sees the fine, free growth of it in others, an envious respect attacks him. For

21:Huxley Q, T-5 (no date) 1960 FL11 Luo
Masai FL12

233 The Masai, numbering about 85,000, keep about one
177 million head of scrub cattle, and 660,000 sheep and goats.
556 They *could* export fat steers and lambs, but have done next to
[161] nothing to improve the quality of their animals. This is because they do not need the cash. There are old men living in mud hovels with little but ear-rings, a spear and a blanket who could at any minute realize several thousand pounds for their cattle. Scarcely one of them could not afford a motor-car if he wanted one, probably a Jaguar at that. The plain fact is they do not want motor-cars, or beds, or kitchen sinks, or radios, or refrigerators, or washing machines: they just want cattle, which they have, and which the processes of nature will increase for them without their having to do any disagreeable work.

It is an *impasse*. The whole machinery of modern society, modern trade, modern development, has been halted by the Masai's refusal to keep up with the Jones's, or the Kamaus in this case. It is like a great Britannia aircraft grounded by a midge in the works. Modern civilization runs on avarice as cars on petrol, and if there is no pump where you can fill up with avarice, you simply stay where you are.

But even the Masai are not really free of avarice: it merely takes a different form. If they do not want bicycles and trousers, they do want more cattle, and this has led them into a great error. Instead of rejecting everything the West offered them, they accepted the hypodermic syringe of the vets. First of all the vets put an end to rinderpest, and then, rather less successfully, dealt with various other diseases that were keeping their herds in check.

233 No doubt it would have needed superhuman self-denial on
177 the part of the Masai to have rejected this magical means of
185 ending the periodic epidemics that had wiped out all but a rump of their cherished herds. Yet these were the means by which nature had kept herds and habitat in balance. Vegetation, controlled by constant factors like rainfall and soil structure, cannot multiply as creatures of the animal kingdom can, and do. The fact remains that to accept the vet's syringe was fatal to the Masai, and to offer it to them, as the Government did, without also insisting upon some means of keeping down the livestock population, was an act of remarkable

21:Huxley Q, T-5 (no date) 1960 FL11 Luo
Masai FL12

imbecility—or perhaps not remarkable, since nothing has been more characteristic of the half-century of European intervention in Africa than the slap-happy introduction of bright, well-meaning ideas by enthusiasts of all kinds, without any regard for their long-term consequences.

Anyway, vets controlled diseases, livestock multiplied and their hoofs and mouths destroyed the precarious grass cover of the plains. The result is that, except where the tsetse fly remains in control, the Masai are living in country poised upon the edge of deserthood. Some of it has gone over the edge, some hovers on the borderline, some has not reached it yet. And so pressure mounts upon those regions that are still protected by the tsetse fly.

Overcrowded people outside want to get in, overstocked Masai themselves want to take their herds where grazing is still rich and deep. If either succeed, unless they adopt very different methods, they will destroy those regions as surely as they have damaged their present inheritance. Agricolas and vets do not want to see these last remaining areas opened up without strict control. But governments are terrified of controlling anyone by what may be represented as harsh measures, and administrators have inclined to caution since the Masai speared to death a D.C. who was persuading them to sell some steers. So the matter, like many others, rests in a state of suspended flux, and everyone hopes for good rains.

III

Down on the Kenya–Tanganyika border, not so very long ago, there lived an Englishman who kept in touch with the world by carrier-pigeon. For three or four months of the year no vehicle could reach him, and even in the dry weather it was a long, hard, bumpy seventy-mile journey from Narok, where the road ends. The aeroplane has changed all that. An hour's pleasant flight from Nairobi brought us comfortably to rest beside a tributary of the Mara river.

First we flew over the Mau, that range of mountains forming the south-western wall of the Rift Valley. Covered with forests of cedars and olives and, higher up, of bamboos, the

21:Huxley Q.T-5 (no date) 1960 FL11 Luo
Masai FL12

133 Mau is the source of all the rivers watering the western half
[137] of Masailand, Kipsigis and part of the Rift Valley. The birthplace of innumerable streams, it is, in theory, protected by its status as a forest reserve.

● 185 Looking out from the small yellow aircraft expertly handled
311 by June Wright, one of the best commercial pilots in East Africa, one could quickly see how different theory was from practice, here as elsewhere. In a forest reserve no one is allowed to fell trees, cultivate, start fires or graze livestock. In less than half an hour, I counted seventeen active fires and saw the shambles created by innumerable others. Whole ridgebacks of the mountain, sticking up like black spines, were as bare as slag-heaps and already runnelled and creased by gully erosion. Older fires were still smoking in some of these devastated areas; one could see the forest being eaten into like a great fur pelt attacked by moths.

As sure as fate, one day there will be no more water for cattle in the streams below. 'God is punishing us,' will say the Masai: but it will not be God, it will be themselves. The
[233] streams are already shrinking and the Masai are driving their herds farther into the hills to find grazing. They cannot take cattle into forest and so they burn a way in. They are creeping upwards, spreading destruction as they go in order to escape the consequences of destruction they have already caused.

[222] Other fires are started by honey-hunters who burn down trees to smoke out the bees. Often, in the forest, you can see blackened hollow cedars and olives killed by fires tucked into the roots. If the foliage is dry and the wind right, the fire will spread and get out of hand.

563 And then there are 'acceptees': a clumsy term given to men of other tribes who are settling in Masailand, family by family, with the permission of Masai elders. They are tenants: but it is very unlikely that they will ever go.

[167] In South Nyanza and in Kipsigis it is reckoned that upwards of two thousand families a year are crossing the southern border into Masailand and Tanganyika. In recent years a
[582] good many Masai have married Kikuyu or Kamba wives
[842] because so many of their own women are sterile; at one time there was quite a trade in Kikuyu girl-children, exchanged for cattle.

SUBSTANTIVES

193

Plural.	Singular.	English.
Il-ojolge	Ol-ojolgani	The fly.
Ing-ojolge	Eng-ojolgani	The mosquito.
I-ambarambar	O-ambarambani	The butterfly.
I-arambaka	E-arambakani	The bat, swallow, swift.

Examples of other words which belong to this class:

I-ainkaj	Ol-ainkaji	The kidney.
I-ala	Ol-alai	The tooth, tusk.
Ing-alanda	Eng-alandai	The shoal.
I-ali	Ol-ali	The spark, stain.
In-garara	En-gararai	The quill.
In-gipare	En-gipanai	The nose.
In-girwan	En-girwani	The ash.
I-kaka	Ol-kakai	The thorn, thorny plant.
I-kiddeje	Ol-kiddejai	The tail.
I-killidij	Ol-killidiji	The sheep's dung.
I-kipa	Ol-kipai	The tusk.
I-nam	Ol-nami*	The twins.
I-nanaiga	Ol-nanaigani	The corpse, spirit.
I-ndaw	E-ndawi	The egg*.
I-ngak	E-ngaki	The ale*.
I-nkiddeje	Ol-nkiddejai	The reed.
I-nnak	Ol-nnaki	The grain or rib of maize.
I-nnya	Ol-nnyai	The chain.
I-ngkara	O-ngkarai	The arrow.
I-ngkanga	E-ngkangai	The iron wire.
I-nnti	E-nntii	The dust.
I-nnya	O-nnyai	The maul.
I-tian	Ol-tiani	The bamboo.
I-tudeia	Ol-tudeiai	The bull, steerage.

Exceptions.

There are only a few exceptions to this rule. They are as follows:

I-Mamma	Ol-Mammai	The Masai*.
I-Lenagna	Ol-Lenagni	The Europeans*.
I-Mamaga	Ol-Mamagni	

* Ol-nami means a child who has a twin brother or sister.
* A large egg-shaped rock used for bars, &c., is Ol-ndawi, pl. O-ndawin.
* An unlucky child, or a dwarf, is I-Ngaki, pl. I-Ngakin.
* The original name of the Masai is said to have been I-Ilm (sing. Ol-Ilm), and one even now occasionally hears old people using this word, especially when relating stories of former times. According to tradition the present form dates from the introduction by the Swahili traders of a certain kind of bead called Ilm or Ilmm (sing. O-ilmmi).
* Europeans, or white people, were formerly called I-ngiyo, the hairy ones. This appellation was afterwards changed to I-Lenagna, a corruption of the Swahili word Ennaga, which in the turn gave way to the present form.

has a cow, which he looks after and tends, it bears, and by so doing enables him to live, for he can marry, and have children, and thus becomes rich.

233
181
[554]

Now cattle feed on grass, and the Masai love grass on this account. [824]

824

Whenever there is a drought, the women fasten grass on to their clothes, and go and offer up prayers to God. [789]

If a warrior beats a boy on the grazing ground, the boy tears up some grass, and when the warrior sees that the child has grass in his hand, he stops beating him.

Again, if the Masai fight with an enemy, and wish to make peace, they hold out some grass as a sign. [928]

Whenever warriors return from a raid, and it is desired to praise those who have killed some of the enemy, a girl takes a small gourd of milk, and having covered it with green grass, sprinkles it over them. [103]

Then, if people move from one kraal to another, they tie grass on to the gourds.

Should one man ask forgiveness of another with grass in his hand and his request be not attended to, it is said that the man who refuses to listen to his prayer is a Dorobo, and that he does not know about cattle. [217] [186]

Again, if a man who is proceeding on a journey sees a tree which has [484]

Food.

Amongst the Masai the principal food of the old men, the women, and the children is milk. 262

The warriors alone drive bullocks into the forest, and slaughter them there: at other times they go to the married people's kraals and drink milk, but they never remain for two months together without slaughtering.

Whenever the old men, the women, and the boys are able to do so, they likewise eat meat. They also eat an ox if it dies a natural death [1], or if it is bitten by a snake, or if a beast of prey has killed it.

The Masai elders, however, do not slaughter their cattle without good cause, and a man who is very fond of meat is called a Dorobo. [186]

Whenever a woman gives birth to a child, a bullock is slaughtered, and she is given the fat. [846]

A pregnant woman is not given good food. When she wants meat, she is given bones or lean scraps; and when she wants milk, water is mixed with it. [843]

The Masai are also very fond of blood. They tie a leather ligature round the neck of a beast and pierce a vein with an arrow, the shaft of which has been blocked. When the blood gushes forth, they catch it [415]

[1] The Shilluk and other Nilotic tribes also eat cattle which have died a natural death (Gossi, *Seen Faces in the Sudan*, p. 92, &c.). [171] [113]

2: Bernardi E, M-4 (no date) 1955 FL.12 Masai FL.12

195 permanent by the present administrative arrangement, but were not established by it. The land which divides the Samburu in the north from the Kapiti in the south of Kenya, was once the home of the Laikipiak and the Uasin Gishu Masai. In those days, Masailand was a continuous strip of land stretching over the plains south of Mt. Kilimanjaro and Mt. Meru up to the shores of Lake Rudolph. At the end of 19th century a great cattle plague and, even more, civil wars (the Kapiti versus the Laikipiak and Uasin Gishu) wrought havoc among the latter, who were almost destroyed. The few remnants have been absorbed by other Masai tribes, especially the Kapiti and the Kisongo. The Laikipiak plains west of Nanyuki which in 1904 had first been set aside as a special reserve (the Northern Masai reserve), were subsequently declared open to European settlement, and by 1911 Agreement the Southern Masai Reserve was enlarged into what is now the Extra Provincial District of the Masai in Kenya Colony.*

[131] [135] [149]

* * *

631 A comparative analysis of the literature shows the existence of three graded territorial units, the major and the minor territorial sections, and the village. A character common to the first two sections is the absence of a clear limit or boundary. The sections are spoken of in terms of watering and grazing rights. The nomadic aspect of Masai life is chiefly responsible for this territorial vagueness. The absence of any centralised authority to check people and cattle's transhumance is another important cause of the vagueness of Masai territorial organization.

632 101 619 The major territorial section is made up by the area in which the movements of a full tribe usually take place. The existence of

* SANDFORD, *An Administrative and Political History of the Masai Reserve*, London 1919, *Appendix*; *E. L. C. E.*, p. 188. One may note that the Uasin Gishu and the Laikipiak, together with the Siria and the Lumbwa were despised as inferior, for they were not considered as "pure Masai" by the other tribes who regarded themselves as descendants of Mandala. See FERNANDES, p. 7. This ill-feeling may explain in part, the fury with which the Kapiti fought against the Laikipiak and the Uasin Gishu.

[186]

In December 1950, I visited the Ndigiri Dorobo at Dol Dol on the Mukogodo Hills, some 80 miles north west of Nanyuki. They claim to have been dependent on the Laikipiak Masai, and they survived the slaughter thanks to their seclusion in the forests. Their present outlook seems to be entirely Masai. The names of their age-classes are consonant with those of the Masai.

727 the property of the successful warrior. A warrior can
[721] have no property, and hence they all become his father's.

The spoil being divided, the party were next able to do full honour to the men lost in the raid—those being considered worthy of all praise "who rush into the field, and foremost fighting *fall*;" while men who die ignobly at home are only worthy to be despised and thrown to the vultures. Hence the warriors howled and jumped into the air in the dance, till the dead were duly commemorated.

648 In this manner, Moran saw a good deal of fighting, and soon rose to fame in many a campaign to U-kambani, Galla-land, the Coast region, Sûk, Kavirondo, Elgumi, and Nandi. The two latter tribes proved to be the most difficult to deal with, the one from its great numbers, the other from its fighting powers.

669 Civil war next broke out, and he had to proceed to the assistance of his brethren of Naivasha, who were hard pressed by the Wa-kwafi. In these civil wars, the affair was gone about in a very civilised fashion. Sudden and unexpected attacks were not indulged in. A cause of war was first discovered—probably, as in more civilised countries, merely to keep their hands in or as an outlet for internal unrest. Preliminaries were then settled most amicably, and the stakes arranged. A place was next chosen as the field of battle, and to this all the warriors of the two districts came with their cattle and young women. As the fighting would be protracted, a truce was declared, while kraals were built in the opposing camps. A certain number then proceeded from both sides, and like gladiators in the arena, they closed in furious strife, spurred to deeds of daring by the women on both sides. The Wa-kwafi were the conquerors, and the cattle of the Masai fell into their hands; and following up their advantage, they nearly drove their brethren from the entire region. (Of this war I have already spoken.)

522 As a mild relief, and a variation from these serious matters,
186 it was the dearest delight of our swaggering young friend Moran to "draw the badger" in the person of the Swahili porters who might be meekly endeavouring to pass through his country. These he would dub "donkeys," in allusion to their being burden-bearers like those interesting quadrupeds. He could keep the kraal in a roar of delight, as he described how he had frightened this one out of his wits, or spitted another on his spear, or smashed the skull
431 of a third into jelly. The strength and the beads he re-

THE COIFFEUR OF THE MASAI WARRIOR

By H. F. I. Elliott

308 It is surprising to find that in Hollis' standard work on the Masai there is no precise description of the head gear of the 'morani' or warrior. No doubt the fashion has been described somewhere, but some details of present day practice in Tanganyika Masailand may perhaps be put on record here.

Of all the distinctive features of the Masai, this is the one which attracts most attention from the casual traveller and invites references to 'Roman Centurions', 'Red Indians' and the like. Its advertisement value is certainly considerable and not ignored by the Masai in their conscious or unconscious efforts to preserve their identity. Certainly removal of the coiffeur and its concomitant red ochre has a surprising effect in obliterating Hamitic characteristics of feature and bringing out those derived from the now liberal admixture of 'Bantu' blood. [196] [149]

564 342 It is still so customary for youths after circumcision to adopt the traditional garb, even though they may be sons of progressive parents and themselves have been to school, that there might well be an 'old school pigtail' for graduates of the Masai school. It is by no means unusual to hear a pair of pig-tailed and ochred 'morani' discussing their performances in some inter-house football match of their school days, while leaning on their spears in the precincts of a cattle market.

308 There are many varieties of head gear to be found in Tanganyika, one, two, three or more pigtails, the 'ridged helmet' style, heavily plastered and heavily beaded styles, but it seems to be purely a matter of fashion and not linked with clan, section, age set or even locality (except in so far as fashions naturally tend to be localised). The construction of all is basically the same and the result is covered by the single term 'Ol deike'.

The materials used in the head gear are as follows:

[324] (i) a length or lengths of pliant but straight stick one foot to fifteen inches long, cut from the tree known as 'O-siati' (*Tamarindus indica L.*; the name is also applied to the shrub *Grewia* which may serve the same purpose at highland altitudes).

(ii) a strip of the inner skin of a sheep an inch wide and two or more feet in length.

[328] (iii) several feet of fine string made from ox gut or tendon.

[324] (iv) a foot or two of cord made from the 'olorienyi' tree. This tree is, I think, correctly identified by Hollis with a species of fig, *Ficus Sycomorus*, the cord being prepared from the aerial rootlets. But there is some doubt in the matter which perhaps a reader of this note may get an opportunity to clear up. For Sattlemmbe

latter is of little economic significance, except that it is the duty of the warriors to get cattle by raiding. In the division of work, the people mainly concerned are the uninitiated boys, the girls, and the women. The boys do most of the herding, assisted by the elders. Women and girls milk and act as servants to the warriors. The girls do household work till they are old enough to become lovers of the warriors, when they do very little work. The greater part of the work thus falls on the older women, who besides doing or supervising the milking and other ordinary household tasks like fetching water and firewood, build the huts, load and drive the donkeys when moving, prepare skins for clothing, and trade with neighbouring tribes for food and other things. The warriors need to be occupied, exclusively either with war or preparations for war, or with dancing, visiting, and making love. Their military activities have today been replaced by certain tasks connected with cattle, and by cattle-stealing and raids on neighbouring tribes. The senior elders are occupied with political matters, and some of them with the instruction and control of the initiates and younger warriors; they also help with the herding, and take part in trading with the neighbouring peoples.

326
[34-5]
[34-3]

The only specialists in the economic sphere are the smiths, *ilkimwanu*, sing. *olkimwanu*, who live segregated from the rest of the Masai, and marry among their own tribe. They have a distinctive behavior station, and are despised by the Masai, who all their hands before taking anything from a smith. At one time the smiths had near deposits of iron ore, such as those in the Mangaria district; but nowadays the availability of trade-iron has given them greater freedom of domicile. They make the iron-work used by the Masai, including spears, swords, and ornaments.[1]

323
439

Though according to Hollis a few Masai women made pottery, the Masai as a rule buy their pots from the Dorobo.

Food

362.
[34-1]

Except among the agricultural Masai, no cereal or vegetable food at all is grown, nor was it eaten in the old days by warriors, whose diet consisted of meat, milk, and blood, the latter providing the necessary salt. The animals eaten included their own cattle, buffalo, *ol-ereman*, and *ilmoi*, *e-ainu*, which they considered to be related to cattle, and therefore fit to eat.[2] Warriors were not allowed to eat honey, to drink honey-wine, or to take tobacco, though some took snuff. Children and married people eat vegetable food, and the meat of cattle which die a natural death. Warriors when they want to eat meat, build a rough shelter called *al-pul* in the bush where, accompanied by a boy to do the work, small groups feast upon the meat of an ox supplied by the father of one of their number. The elder who supplies the ox is given some of the meat, and this is one of the regular sources of meat for married people, for meat eating is the regular practice of warriors. Men and women do not eat together, and fish, birds, eggs, and game other than buffalo and eland are not eaten by any Masai.

[34-1]
[34-2]

Trade

[34-1]
[34-2]

Since the Masai are not self-supporting, they have to trade with the Dorobo and *ilkiborbor*, *il-meek*, where they dwelling, in order to get what they want. The chief suppliers are the Kikuyu, Chagga, and Taveta, and for certain things, notably ivory and honey, the Dorobo. The media of exchange are cattle (old, barren, and otherwise unsatisfactory cows), old and thin goats and sheep, donkeys, hides, and tobacco. The principal goods brought are food (beans, millet, maize) and tobacco, which they get from the Dorobo; the chief suppliers of meat are Indian traders, also Sikhs,

[1] Lambert says that the Masai buy their swords from the Kikuyu (*J.R.A.I.* LX, p. 208), the story told by the men near the Kikuyu border, though it is perhaps a recent development.

[2] The Chagga also consider the buffalo to be the equivalent of the ox. Raum, *Chaga Childhood*, chap. XX, Cambr.

from each side suckled each other's babies. Peace was then kept till it suited one side to break it. With Bantu tribes the Masai sometimes made mock blood-brotherhood with intent to deceive, for they have no blood-brotherhood of their own. As among the Nandi, grass is a sign of peace, and a handful of grass constitutes a plea for mercy recognized by the Masai and those whom they count as more or less their equals, the *Il-magati* or "enemies," such as other pastoralists, but not *Il-meek*, the Bantu agricultural tribes. 728 608 648 186

Legal functions

The Masai legal system seems to be less organized than that of the Nandi, and to depend even more on the force of public opinion than on the position and status of the council leader. It appears that only in cases of homicide is there anything like a regular procedure. The Masai distinguish between intentional and accidental homicide, the difference being that for the latter there is no blood feud and the amount of compensation is smaller. The number of blood-cattle paid as compensation, *inkiko ee-l-oikop*, "murder cattle," varies, but may be as high as two to three hundred for a man; Hollis says 50 for a boy, and Merker 10 head of cattle and 10 goats and sheep for a woman. Foubrooke gives the figures as 40 for a circumcised man, and 20 for a woman or uncircumcised man. The Il-Arusa are recognized as a group which pays and receives blood-cattle. The murder may be avenged by the dead person's brothers who may try to kill the murderer; and if compensation is not paid, the resulting feud may involve all agnatic kinsmen on both sides. It is not clear whether killing of the murderer makes the avengers also liable to compensation. If the victim belongs to the same sub-clan as the murderer, no compensation is payable. If they belong to different sub-clans of the same clan, or to different clans, all members of the murderer's sub-clan contribute, and the cattle are divided among the members of the victim's sub-clan after his senior brother has received half the stock. When a settlement has been made, peace is made between the families concerned by an exchange of garments. Maguire gives details of three methods of dealing with cases of murder. (1) The relatives of the victim take all the murderer's cattle; they hold a council and, after giving a few cattle to certain elders and old women, the left-overs, herd-leaders, and cows near calving are returned to the owner; he and they divide among themselves. (2) If action is not taken at once, the relatives of the murderer send a stick to the relatives of the victim, the acceptance of which implies an agreement to meet and settle the matter, and compensation is arranged, the figure named being 40 head of cattle, with nine more added to symbolize the human body (reckoned by the number of its orifices). (3) Sometimes the relatives of the victim do not take action for two years or more; they then raid the murderer's kraal by night and demand the number they want. For killing a smith, *el-kunot*, no compensation was payable, nor was there a blood feud. If a smith killed a Masai, several warriors set out and killed several smiths. Theft (except of cattle) is apparently considered of little account: "if a Masai steals milk or meat or other small things, he is not fined. Grown-up people rarely steal," says Hollis. For cattle sets, the thieves when caught were fined, seven head from each man concerned. 671 626 682 681 627 614 672 685

The general principle that a man is entitled to compensation for a wrong seems to be recognized by all Masai; and this recognition is extended to "foreigners" like Dorobo, provided the people concerned are well known to each other. On being accused a man may submit to an oath, *el-mamai*. In some cases a diviner of the type called *el-gnanki* by Merker is employed to find a guilty person. The whole subject of Masai legal institutions needs detailed investigation. 681 695

Modern administration

The Masai political structure has proved even more difficult of adaptation than that of the Nandi, since it lacked the clear-cut *paramat* divisions of the latter. Up to 1918 the chief laibon in Kenya was accepted by the Administration as a paramount 631 648

M 614 /18/ The 'L aiser and El mûleljan to a certain extent stand in con-
[186] trast to the El meñgana, whom they half-mockingly, half-abusively also call 'N dalata-gutok (1)

M [192]

1. 'N dalata, gluttons, en gutok, the mouth; by putting the two words together the idea of the first is supposed to be intensified.

or Eng-adji-nagûl-alai (2).

M [192]

2. : the house of the hard teeth; nagûl : hard, el alai, the teeth.

and, in contradistinction to them, designate themselves as Eng adji el masai. As the reason for this, tradition relates that the El
M [173] meñgana were once separated for a longer period of time from the
[191] other two tribes and, upon reuniting, made a bad impression because they no longer observed the divine commandment forbidding the killing of female animals for consumption. This gave rise to the above nicknames, which, freely translated, mean "greedy gluttons."

M 613 The El bedjé and El gové are not infrequently designated as El aisegela, a name formed after that of a war leader, Os segél. As the reason for the combination, it was said that members of the
M 791 two sublineages were once notorious cattle thieves.

The most outstanding lineage, not only of the 'L aiser tribe,
[613] but of the whole Masai people, is the El gitok, because both the
[754] family of the chief (el olboni) and that of the sorcerer (el goiatak) belong to it. The designation "chief" is actually not quite correct, since the el olboni does not rule directly and does not exercise any
M [829] real executive power. He rules only indirectly: the firm belief of his subjects in his prophetdom and in his supernatural ability of sorcery gives him an influence over the destinies of the people. Despotism and cruelty, such as we find among all Negro rulers, are
D [791] foreign to him. He is less a ruler than a national saint or a patriarch, in whom the Wakuafi and Aisé also see their head. The people speak of his saintly person in timid awe, and no one would

306 301 325 [462] [439]

/116 cont./

the wives of the blacksmiths. Smaller ornamental objects of wire are made by the other Masai women. The small chains of iron and copper wire are not made by the Masai themselves, but are bought ready-made from the caravan people or the sedentary neighboring tribes.

XIV.

000 Character. -- National pride. -- Disrespect for foreigners. -- Designation of foreigners. -- The Masai in the service of the European. -- Attitude of the Masai living among his people toward the European. -- The Masai toward their kind. -- Hospitality -- Position of the woman. -- How the Negro illustrates the character of the Masai. -- Expression of emotions and other gestures. -- Strength of vision. -- Art sense. -- Color sense. -- Orientation ability. -- Song. -- Ideal of beauty of the human body.

186 799 829 [181]

The most outstanding trait in the character of the Masai is their national pride which is based on the religious view that they are the chosen people of God. God created the world and all that is in it only for them. All non-Masai are subject to the Masai people and their property belongs to them. This explains the haughtiness and the deep disdain toward the sedentary Negroes, who are not familiar with 'Ng ai and have no share in the good things created by him and who therefore are condemned to wrest their daily food from the soil in the sweat of work. On the other hand, God cares for the Masai as for his children, they need not work "ad dobira mdil sidai" a work is not good, everything belongs to them anyway, and, since the Negroes do not give it voluntarily, the Masai take it by force. In fact, the Negro, in the opinion of the Masai, only has justification for existence as keeper of the livestock created by 'Ng ai for the Masai.

[461]

186

In general the Masai designates all non-Masai as ol oleng (sing. ol ngolk a term that is to be translated as "subjection." /117/ The Masai does not know friendship and loyalty toward the

/117 cont./

• 186 unbelievers, every trick, every deception is permitted against them.
[101] In particular other names exist for distinctions. For the tribes racially related to them these names are derived from their places of residence, in connection with which it is to be noted that for these the Masai have their own nomenclature. For Europeans he uses the 'l aisungu derived or transformed from the Kisuahili. Finally, he calls the Negroes el mahat (sing. ol mahatinda), which is to be translated appropriately with "the savages" and corresponds to the word Waschensi with which coast the people designate the Negroes of the interior.

181 The first impression which the Masai, in comparison with the Negroes, makes on the European is definitely very much to his advantage. The handsome, tall figures are charming in themselves from the first and often make haughtiness and insolence appear as pride and candor, which stand in pleasant contrast to the hypocritically flaunted, groveling submission of the Negroes.

829 A certain distinction is really not to be denied the Masai. In this respect he stand high above the average Negro. It is significant that for him only the thrusting weapon -- spear and sword -- is regarded as worthy of a Negro. He has a profound contempt for the Negro bands shooting with poisoned arrows treacherously from the bush, whereas he judges this situation more leniently in connection with the Tatoga in the process of sharp decline, who are able to muster only very meager fighting forces. He therefore also condones the use of guns, at least in part, by the divisions, numerically weak, of the Protectorate Troops. It seems to him justified against the poisoned arrows, but he does not by any means regard it as noble and decent compared with his thrusting weapons. Thus, a small Masai youth, who was in my service for several years as a boy, often reproached me in the aforesaid way.

/119 cont./

177 181 609 829 that" (1).

> 1. When, after receiving news of an ugly misdemeanor or crime, I spoke to one or another more trustworthy Masai about the unknown culprit, I often heard: It was surely not a Masai. A Masai would not do anything like that. Such things do not happen among the Masai.

Though he may know better, he accuses an el mōgi just as unhesitatingly as he absolves a fellow tribesman (2).

[544] [326]

> 2. It may be mentioned here that, according to my observation, the insincerity and dishonesty of the people belonging to the blacksmith caste are decidedly greater than that of the other Masai, so that it seems as if the contempt and bad treatment that the former experience from the latter have bred an inferiority of character in the course of the millenniums.

829 The mental superiority of the European impresses him only in such cases where it has convicted him of some villainy, while his technical skills reek far too much of the despised "el kunyi" to the Masai to seem worth notice. It is solely the gun of the Protectorate Troops that obtain for the white man respect and influence among the Masai and have made this manner race of East Africa somewhat more modest.
